ard Motor Car Company had an interest in it. It is quite usual for patent solicitors and patent lawyers, particularly when acting as solicitors, to include the power of attorney with petitions, and I did this; and, of course, I have done that with all of the applications that I have filed for employees or parties who signed applications for the Packard Motor Company; it is the usual custom. I have done that for years. I don't know whether you would say I was "retained" by the applicant in all of those cases, but I consider myself his attorney.

Q. Who gave the power of attorney to Mr. Gehr in this case? A. What power of attorney?

Q. The power of attorney to Mr. Gehr, I see was given by Cleveland Trust, and the same is true of power of attorney of Mr. McCoy in that application. It wasn't necessary to join Mr. Gulick in that, was it? A. I don't know.

Q. You don't know; you don't know the law on that, do you? A. I don't know that I see why—

Q. You don't even know the Patent Office practice. You know well enough that the Patent Office recognizes the power given by an assignee, don't you? A. That is usually the case.

Q. Well, you know as a matter of fact, as distinguished from law, that the Patent Office recognizes a power of attorney given an attorney by an assignee of an application? A. I think the assignee of all the interest, yes, it is my recollection.

Q. Where did you find that letter that you don't want to produce—in your own file?

(Narrative continued) I found that letter in the file of the Packard Company with that particular application, with the patent drawings. I did not find it in Mr. McCoy's files, but in the files of the Packard Company.

When I testified in this case I didn't make any reservations at all as to my conversations with Mr. Gulick. I don't think I took advantage of the privilege of an attorney when Mr. McCoy asked me questions about Gulick's disclosures to me or Gulick's conversations with me; I don't know of any particular reason why I should.

I know that Packard Motor Company, of which I am an officer, owns a certificate of interest in Cleveland Trust Company, the owner of the Gulick patent.

Mr. McCoy: That is going completely outside of the direct examination.

The Master: Oh, that is all in here. He is an officer of the company. It may be preliminary. The answer may stand and you may have your exception.

(Narrative continued) I can't recall whether I saw the amendment appearing on pages 10 to 15 of the file wrapper and contents before it was sent to the Patent Office. I think I have answered that question before, and I can't answer any better now than I did then.

Q. In order to refresh your recollection I want to call your attention to the fact that both of those amendments differentiate from the Schoengarth patent 1,174,092, a copy of which I hand you, and a copy of which you need not read, but have you seen that patent before? A. I probably have seen it.

(Narrative continued) As I told you several days ago when I was here, I had no recollection of the Schoengarth patent then. I have seen the patent since then. I have a faint recollection of having seen a patent that looked like that, but I have seen lots of patents since.

I am a member of the bar of the Supreme Court of the District of Columbia, the Court of Appeals of the District of Columbia, and the Supreme Court of the United States.

I can't recall whether I have ever had any cases in Washington, in the District of Columbia, or not. My occupation has been that of a solicitor of patents, and partly as an executive of the Packard Motor Company. Outside of that it has primarily been that of solicitor of patents.

(Short recess taken.)

I was admitted to practice before the Patent Office before 1917. That is going back a long ways. Just a minute—I think about 1905. I was admitted to the bar in 1903 and I was admitted to practice before the Patent Office either that year or before. Of course I know that a solicitor before the Patent Office does not have to be a member of the bar.

Q. Now, I want to get clearly before the Master the relation between yourself and Mr. Gulick. Now, Mr. Pond conducted the negotiations on behalf of Mr. Gulick, at least up to the time of May 18, 1917, as indicated by the letter in evidence from Gulick to yourself? A. You are showing me a printed copy of an interference testimony.

Q. Well, you can have the letter before you. I thought you would remember. A. I think that is substantially correct. I certainly wouldn't dispute it.

Q. Well, you had that letter before you when you testified a little while ago. It mentions, "I trust you will give this subject matter your early attention and advise Mr. Pond accordingly, that the subject matter may be properly closed up." Up to May 8, 1917, Mr. Pond was still representing Mr. Gulick? A. I think Mr. Pond represented Mr. Gulick during those negotiations for the purchase of this invention and the other inventions and patents that the Packard Company purchased from Gulick in 1917.

(Narrative continued) My recollection is that the purchase of the Gulick applications, indicated in the March 17, 1916 letter, was completed in August, 1917. Between that date and November, 1917, when the application was filed, I prepared the application for Gulick to file in the Patent Office. At that time I was employed by the Packard Motor Company, on a salary. I was giving my exclusive time to the Packard Motor Company. I wasn't taking in any outside patent business for remuneration, and I wasn't doing any free for friends, that I recall. I can't say whether or not I took out any application for anybody except for or on behalf of the Packard Motor Company, during 1917, because I don't recall any. I don't recall any applications which I had taken out one or two years on either side of 1917 for or on behalf of anybody else than the Packard Motor Company, but I know I have prepared and filed applications for others during my employment by the Packard Company, for friends and others, practically all without remuneration, some few with.

I don't remember having said that I put a week on the preparation of this application for Mr. Gulick, but I think probably I did. During that time I drew my pay from the Packard Company. The Packard Company, as assignee, through me had control of the Gulick matter, this Gulick application, during that period on account of the existing contract. I sent the application and the assignment to Mr. Gulick to sign and he executed the application, including the power of attorney and the assignment, on the same day. The applicant's name is almost universally put on the drawing, and I think was in this instance. It was in this instance, as can be seen from the enlargement which Plaintiffs' coun-

sel has produced, which satisfies me the name, Mr. Gulick's name, was placed on that drawing. It is generally done even though the application is on the same day assigned to an assignee; I don't think that controls at all. It is a matter of custom for the applicant to appoint an attorney, not a matter of convenience.

Q. It is a matter of custom, it don't establish any relation of attorney and client between the applicant and the attorney who prepares the application in behalf and for the assignee, does it? A. I can't answer that. I think that is a matter of law. I would say that it did.

Q. But you have never considered yourself as an attorney for any of those applicants, have you, after it was assigned to the Packard Company? A. I considered myself an attorney for all of them, undoubtedly attorney of record in the Patent Office.

Q. And you would have taken care of Mr. Gulick's interest adverse to the Packard Motor Company on account of the appointment by power of attorney? A. They weren't adverse.

Q. But if a situation would have arisen where Mr. Gulick would have refused to execute that assignment, you would still have filed the application and proceeded?

Mr. Richey: The plaintiff is on the side-lines in this matter, but we have a right to object to building up a lot of record here.

The Master: I think not. This man has refused to produce this letter, and he is being inquired concerning it. You have produced this witness and it seems to me it is proper cross examination.

A. That is a moot question which I can't answer. I don't know what I would have done at that time, but I might add if he would not have signed the application I couldn't have proceeded with it.

(Narrative continued) Of course I could have proceeded with the application if Gulick had signed the application but had not signed the assignment. I don't know whether I would have gone on with it in that event.

My relations with the Packard Company, of course, were such that I could have proceeded with the Gulick application, filed it in the Patent Office, and represented him adversely to Packard Motor Company. I don't know what I would have done in that respect. I can't answer that yes or no, either way; I don't see why I could not.

Q. You have stated on direct examination that after a period of time covering the negotiations and so forth, and disclosures of Mr. Gulick, that you proceeded with the filing of the application, that the matter was delayed on account of the Liberty Motor design, and that you finally sent the application to Mr. Gulick to sign. You testified to that on direct examination? A. Yes.

Q. But now you take the position that the letter of transmittal of the application is a privileged communication, is that right? A. I think it is, and I don't see any reason why I should show it to you.

Mr. Bruninga: I am ready to have the Master rule on it.

(Thereupon, argument was had by counsel for the respective parties; counsel for plaintiffs citing decision of the Supreme Court of the United States in *Chirac et al. vs. Reinicker*, decided in 1826 reported in *Wheaton*, Vol. 11, page 278, at page 477.)

The Master: If the witness wants to insist still further on this privilege, I will take a little more time and examine the question to satisfy myself.

The Witness: May I say I would like to have you do that. I will say that for this reason, if I may do so, I came down here voluntarily as a witness connected with the interim, the time between the beginning of these negotiations and the filing of the application. I think I have responded, both to cross examination and direct, on that; but from that point on, where the defendants' counsel has asked me to go into my records on matters that don't concern in any way that time interval, I just don't like to release my privilege, that is all.

(Further argument had by counsel, counsel for defendants citing *Jones on Evidence*, Third Edition, page 1165, and case thereunder 128 U. S. 464.)

The Witness: Before you make a ruling, may I make a statement?

The Master: Certainly.

The Witness: In this particular matter at that time, at the time in question, in the fall of 1917, I was counsel for both Gulick and for the Packard Motor Car Company. I am still counsel for the Packard Motor Car Company. These files belong to the Packard Motor Car Company. This particular communication that is in controversy here is, as

you know by having read it (the witness having previously shown it to the Court), not of a great deal of importance in all probability, but if your ruling is that this must be produced here and shown to defendants' counsel, it will mean also that the other communications will have to be produced, presumably, and in many of them there are references made by Gulick and by me to other patents, other inventions which have nothing to do with this case, and which I do not want, and I don't believe Gulick would want, spread on the records of the Court, where they become public, and I can't see why I should divulge this evidence, these communications, without the consent of Gulick and without the consent of the Packard Company; and on behalf of the Packard Company, as an officer, I will not give the consent.

Mr. Bruninga: I want to say right here I don't want any communications as to any other inventions except this one. I have no desire or, that at all, but answering Mr. Tibbetts, there is another proposition: the Court can pass upon the matter piece meal. For instance, if this particular letter is proper to be received, the Court can then determine whether the others can be received, in succession, that is the way I understand it.

The Master: Well, as I believe, on such examination now as I have been able to make, Mr. Bruninga, the rule of practice is that this communication should not be received unless there is a waiver, as Wigmore says, on behalf of the client. Now, the client in this case is either Gulick or the Packard Motor Car Company. I am not at this moment determining which it is. But Jones states the rule in this way, in this edition that I have, section 469, "For the privilege to exist it is sufficient that communication has been made by the client to his legal adviser for the purpose of professional aid with respect to matters in which such aid may be properly given and in respect to which litigation may properly arise." Now, further, this seems to be borne out by some examination in the short time I have had as I have been able to make of Wigmore, and the discussion of this appears in Section 2323 in this edition which I have before me, and which covers a page or two and is to the same effect as the rule stated in a few words in Jones. And in

view of the case we have before us, this *Brunnager vs. Smith*, which limited it to solicitors, I don't feel that at this time I could permit the admission of the document, of the letter. If, on further examination before this trial is over, you can find other authorities and want to present the question again, I will be glad to entertain it, but at this time I will sustain the witness in his refusal to produce this letter.

Mr. Bruninga: Your Honor understands, of course, this witness is an officer of the Packard Motor Company who passed title to the patent in suit.

The Master: I understand that, and this witness was acting in part for such Packard Motor Company, as its attorney, in preparing the application, too, I think, although the application was signed by Gulick himself.

Mr. Bruninga: I admit he was acting on behalf of the Packard Motor Company.

The Master: So we will let it stand there at this time. If you find other authorities you want to present I will be glad to entertain them.

Mr. Bruninga: Of course this is one case where I cannot make an offer under the equity rule because I don't know what the evidence is going to be. Your Honor will grant me an exception in this case.

The Master: Yes, you may have it.

(Narrative continued) I have known Mr. Gulick since about 1908 or 1909. I don't think I have been his attorney in any other case prior to that time. I don't recall his ever telling me about a piston in 1908 or 1909. I learned about the particular piston in Exhibits 36 and 37, the original description and the sketch, some time before my letter of March 27, 1916. I can't say how long before, because as I have stated before, Mr. Gulick has discussed with me, and all through that time discussed with me, a great many of his inventions; whether he discussed this one or not, I don't know.

Q. I believe you stated on direct examination that Mr. Gulick's idea of the negotiation and the closing of the negotiation was that he wanted to sell all of his inventions or nothing; in other words, he didn't want to split them up, so much for each one? A. All of that group, yes.

Q. Now, turn to page 131 of the record in the interference proceedings in which you testified, and near the end of page 131 you testified as follows: "Shortly after that March agreement was made it turned out that Gulick was unable to get title to these patents and consequently he could not go through with the agreement. Later he was able to get some of the patents and not others, and he was able to get some additional patents that had been owned by the Amplex Company, and he made a revised offer of sale to us. As I recall it, there were still additional changes in the line-up of patents and inventions made from time to time as the negotiations progressed and as the receivership or bankruptcy proceedings of the Amplex Company were carried on, but always this piston invention of the blueprints, pencil drawing and description referred to in my previous answers were a part of the subject matter involved." The reference is to the exhibits which are now 31, 32, 36 and 37. What did you mean there by "he made a revised offer of sale to us"? A. As he found that one or two patents couldn't be obtained from the receivers or whoever it was that owned them, he made a group offer omitting those, and in other cases he was able to add some patents that he was able to get hold of or expected to, he added those to the group.

(Narrative continued) Mr. Gulick was compelled to make a revision of the contract by reason of the fact he couldn't get all of those patents in one group. He was apparently willing to do that.

I don't think I could have gotten this piston application alone in March, April or May of 1916, because he wanted to sell all of them together, as many of them as he could get. I think the language in my testimony in the interference indicates that he wanted to stick to the whole or nothing. He was compelled to take some of them out because he couldn't get them. He still wanted to sell all of them.

Referring to page 301, which contains the letter of December 24, 1916, which is in evidence, (witness comparing numbers) the letter of December 24, 1916 included the four patents referred to in the letter of March 27, 1916, and it also included five other patents. It is my recollection that those were additional patents to the matter in the agreement of March 27, 1916. Apparently Mr. Gulick was able to carry out his delivery of the patents and applications mentioned in the letter of

March 27, 1916, as it stood as of December 4, 1916; but here also he says that he prefers to dispose of all of them, which simply carried out what I have stated before. He says he preferred to; he doesn't say he insisted upon it, because he has added five additional patents, five other patents. As far as that agreement of March 27, 1916, is concerned, I would say that Mr. Gulick was ready on December 4, 1916 to deliver title, excepting that he doesn't mention the invention referred to in the letter of March 27, 1916, although he refers to the letter itself. I know of nothing that prevented Mr. Gulick from delivering the slide valve motor and the motor piston and the double-acting air cooled motor piston, mentioned in the letter of March 27, 1916; I think his intention was to include all of them in this offer of December 4, 1916.

Referring to page 303, the letter of May 18, 1917, Mr. Gulick had been in somewhat of a hurry all along up to that time to close up the matter. The delay between December 4, 1916, and May 18, 1917, was caused because it took some time for us to get together, which we did in February, 1917, in Chicago, according to my letter of February 28, 1917, which is on page 302. And apparently we were then waiting for Mr. Rector to approve the title, and that I remember quite well. Mr. Rector and Mr. Pond were working on the title papers to see whether Gulick would deliver a good title to all the patents and applications involved.

I don't remember whether Gulick was right when he said on May 18, 1917, "I believe the assignments are all straight"; they were right later. The matter wasn't actually closed up until August. In other words, it took from December 4, 1916, to August, 1917, to get the matter concluded. It was a matter of about eight months between December, 1916, and August, 1917, but a number of things were done, as my letters that I have referred to explain, and as I have explained, the matter of getting title fixed up, it wasn't a delay without action, if that is what you mean.

I know that the matter of title was not straightened up at the time I received that letter of December 4, 1916. I don't know whether he was able to deliver title or not, but the title had not been approved by Mr. Rector, and therefore it was incomplete so far as I was concerned.

I admit there was a period of almost a year, between December 4, 1916, when Mr. Gulick stated he was ready to deliver title, until November 30, 1917, when the appli-

cation was filed in the Patent Office, but I don't say it is unexplainable, because as I have explained to you several times, and I think on direct examination also, there were a good many things that had to be cleaned up. The receiverships, which Mr. Gulick has referred to, and which I referred to, which the letter referred to, made a very complicated title, took a long time to do it, and it took some time for Mr. Rector to act on it. Mr. Rector was extremely busy, as Mr. Gulick points out in his letter. I see no necessity for further explanation on the delay during the period of one year in closing up the title and filing the application.

I don't know what period I had in mind when I testified in the interference, page 133 of the record, as follows:

"*Shortly after the consummation of the purchase of the piston invention* and the other inventions and the patents involved, a file was made in my office and this case with others was before me for preparation of the application. Shortly thereafter the application was prepared, the drawings made, and the papers sent to Mr. Gulick for execution. They were returned by him and filed in the Patent Office. All of this was in the fall of 1917."

I don't know whether or not I traveled back and forth to Washington between August and November, 1917. I don't think Mr. Vincent had returned to Detroit in June, 1917, but he may have. He went back and forth a good deal.

I don't know whether the first Liberty engines were built as early as the fall of 1917 or not.

When I testified, on page 134 of the record of the interference: "During that summer and fall the first experimental Liberty Engines were built by the Packard Company and all of us here were working feverishly to get these first engines built," my recollection seems to have been better then than it is today. When I said "here" I meant Detroit. I was not necessarily in Detroit all of the summer and fall of 1917. My headquarters were always at the Packard Company at Detroit during that period.

I have not looked up how many patent applications the Packard Company filed between August and November, 1917. I never thought of it.

Mr. Bruninga: I would like to have the privilege, then, of filing copies of such patents as I may

be able to find whose filing dates are between August and the 1st of November, 1917.

The Master: By whom?

Mr. Bruninga: By the Packard Motor Company. If I can obtain them from the record.

Mr. Richey: File a list of them, it will be just as well.

Mr. Bruninga: Yes, if you are satisfied with the list, Mr. Richey.

Mr. Richey: All right, no need to clutter up the record with a lot of patents.

The Master: Such document will be received.

(Narrative continued) I stated that the Packard Company was a holder of a certificate of interest in the trust estate. As an officer of the company I am interested in upholding the Gulick patent. I am a stockholder of Packard. The records show that that application of the Gulick patent in suit was assigned to Cleveland Trust Company on September 11, 1922. I don't remember the exact length of time over which those negotiations extended, but it was some months. I was instrumental in making that deal.

It is difficult for me to say whether I approached the Cleveland Trust Company or the Cleveland Trust Company approached me in that deal, because I can't recall just how it came up. My recollection is that it first came up through an attorney for one of the parties to the subsequently formed trust, and after that I can't remember whether I approached the Cleveland Trust Company or the Cleveland Trust Company approached me.

When I prepared that application for the Gulick patent in suit, I don't say that I knew the piston art, or that I do now. I had seen some patents on pistons and prepared and drafted applications for some patents on pistons, but that is a long way from knowing the piston art.

I don't know whether or not I prepared the application for the Vincent patent 1,279,184. It was prepared in my office.

Q. You put into that application all of the disclosures Mr. Gulick gave you—into the Gulick application of the patent in suit, I mean?

Mr. Richey: It seems to me we went over this the other day. We are repeating the same ground and therefore immaterial.

The Master: He may answer.

The Witness: I put in as much as I thought belonged in a patent application.

(Narrative continued) I don't remember whether or not I told Mr. Doolittle, my assistant, what Mr. Gulick had disclosed to me, to enable him to prepare amendments. Neither do I remember telling Mr. Hanley what Mr. Gulick had disclosed to me. The presumption is that I told him enough to prepare the amendment on it.

Q. I notice that by looking at the file wrapper and contents that there was a delay between the first office action, or rather the supplement to the first office action and the first amendment of approximately nine and a half months; that there was a delay between the first official letter and the second amendment of approximately ten and a half months; then there was a delay of about eleven and a half months between the official letter of November 19, 1920, and the amendment of October 31, 1921; but that there was then sudden activity on December 24, 1921, as shown by page 24 of the file wrapper and contents, there was a supplemental amendment filed, adding additional claims, and the supplemental oath. Can you explain that sudden activity? A. No, and I don't know that it needs explanation particularly.

Q. You may not think it needs explanation. A. Right.

Q. But your answer is that you don't know what the sudden activity was? A. I don't recall it now.

Q. I notice that the amendment of October 31, 1921, is actually dated in your office November 29, 1921, and that the supplemental oath is dated December 2, 1921. Also that the Long patent 1,395,441 issued on November 1, 1921. Was the issue of the Long patent on November 1, 1921, any reason for that sudden activity? A. It is quite possible that it was, but I don't recall it.

(Narrative continued) I doubt very much if I ever had seen one of the Long pistons at that time.

There are a lot of things tried out experimentally in the Packard cars. I do not keep track of outside matters of that sort in connection with experimental work. Sometimes I see them, sometimes I don't. I don't recall the Long piston at that time. I have seen the Long patent 1,395,441, but not necessarily at that time.

I can't recall now who prepared the amendment of September 12, 1922, although I know that I signed it.

Q. The Patent Office records show and the exhibits in this case also show that in a certain interference of Hartog vs. Pomeroy, involving an application of Aluminum Company of America, the final hearing was set for January 10, 1922. On February 17, 1922, there was a decision of the Examiner of Interferences in favor of the Aluminum Company of America's applicant, Mr. Pomeroy, and on August 30, 1922, there was a decision of the Board of Appeals reversing the Examiner of Interferences, in favor of Mr. Hartog and against the applicant Pomeroy of Aluminum Company of America. Do you have any information as to that at all, having in mind that the amendment of September 12, 1922 was prepared about 13 days thereafter, and the assignment to the Cleveland Trust Company is dated about 12 days thereafter? A. I don't recall any of that.

Q. Well, as a matter of fact, the records show, the file wrapper and contents show, however, that on October 31, 1921, the time that the amendment was filed in the Patent Office as indicated by page 20 of the file wrapper and contents, you took personal charge of the application after it had been previously prosecuted by Mr. Doolittle and Mr. Hawley. Can you explain that? A. If it needs explanation, yes. I did as I frequently do in cases, if I want to pick up and amend, I do so, if I want somebody else to amend it, I ask them to do so, depending on how the work stands in our office and whether or not I am particularly interested in this, that or the other case.

(Narrative continued) I know Mr. Gunn very well, but I don't remember his article in Automotive Industries of January 29, 1920, which on page 363 disclosed the Long piston; I may have seen it but I don't remember it. I may have known about the pendency of the Long-Hartog interference, and the Hartog-Pomeroy interference. I am saying I do not remember those things now. At the time I may have been cognisant of a number of these things. I may have seen the Long patent as it came out. I tried to follow the Gazette as it comes along, but I can't remember anything about that patent except that I have seen it from time to time.

At the time the amendments of October 31, 1921 and December 24, 1921 were prepared, I don't know whether or not I was familiar with the piston being used in the Maxwell car of the character shown in the Maynard patent 1,655,968; I may have seen it. I may have seen it

in the magazine, if it was in there, if the patent had issued. But I have seen so many pistons and piston patents that I certainly cannot remember that particular one.

Referring to the supplemental oath dated December 2, 1921, which is on page 21 of the file wrapper and contents, and particularly to the statement "said invention was incorporated in an automobile engine and successfully operated in the United States prior to the month of October, 1915," I found that I had some correspondence with Gulick, and in that correspondence I found statements by him from which I prepared this affidavit, and then I sent it on to him and he executed it. I have that correspondence here with me, but I am not willing to produce it; it contains several matters outside of the pistons. I doubt very much if I could cover up that portion of the letter which relates to other matters.

Q. I want you to understand, Mr. Tibbetts, that I do not want any confidential invention between Mr. Gulick and Packard Motor Company outside of this piston, and if there is any way you can arrange to take out of that letter before the Master, or let the Master do it under your direction, parts which do not relate to this piston, I will gladly accede to it. A. I think I will have to take the position that the entire communication is a privileged one.

Q. Including this matter of what evidence you have relating to, that the invention was incorporated in an automobile? A. I think that is particularly privileged, yes. The affidavit speaks for itself.

Q. The affidavit does not speak for itself, Mr. Tibbetts, that is just your own personal opinion. It indicates that a piston of the construction shown in that blueprint has been used in an engine which Mr. Gulick now says never happened? A. That is probably your opinion.

Q. And I cross examined Mr. Gulick about it and he said he didn't have the records and he didn't stand on any privilege, which counsel or the Master can tell you, still you stand on privilege and don't want to communicate anything? A. Yes.

Q. And in spite of the fact that Packard Motor Company is a predecessor in title to the Gulick application in suit? A. Yes.

Q. And in spite of the fact that the Packard Motor Company owns 700 shares in the trust estate? A. I am not sure of the number of shares.

Q. But it owns a substantial number, does it not? A. Not very.

Q. Well, the records of the Court of it show it owns 700 shares. But you still stand on privileged communication? A. Yes.

Q. In other words, you don't care to be checked up, do you, even as to the matter relating to the Gulick piston? A. If it can be called that, but those are your words and not mine.

Q. Did you have any knowledge of the so-called 1911 and 1914 pistons of Mr. Gulick at the time that this affidavit was prepared? A. You mean personal knowledge; of course, I didn't.

Q. Did you have any information at the time it was prepared? A. Information as to what?

Q. As to the character of supposed Gulick 1911 and 1914 pistons? A. I certainly had knowledge of what I assume you refer to as the 1914 piston, because that is the date of the blueprint which Mr. Gulick left with me in March of 1916, but as to what you mean by the 1911 piston, I haven't followed the testimony close enough to identify that.

Q. Well, I will ask you this question: Is the web piston shown in Exhibits 36 and 38—those are the original sketch and the blueprint—is the web piston construction, is that the only type piston that was disclosed to you by Mr. Gulick? A. Oh, no, Mr. Gulick showed me a number of pistons, a number of different types of pistons.

Q. A number of different types of pistons? A. Yes.

(Narrative continued) I, of course, mean that Mr. Gulick showed me the drawings of the pistons. I don't recall if they were actual drawings or sketches; probably both. I recall one in particular because I happened to see it when I was looking over some of these other papers the other day. I saw a blueprint of one of his pistons, which had nothing to do with this, but merely answering your question, I say I saw it. It has since been patented, and the patent as I understand it has been purchased by the Trust. I don't know the number of it. I could give you a description of it, if that will help you any. It is the piston of patent 1,337,538.

I don't recall now whether or not Mr. Gulick disclosed any piston outside of the particular one shown in the Gulick patent 1,315,733, prior to the time of the filing of the application in suit; he may have, because as I say he talked with me about so many of his inventions, if he had any others, he probably showed them to me. I don't

know whether he disclosed a piston to me that didn't have the wrist pin bosses on webs, like 17 and 18; he may have.

I don't know whether you would call, what Mr. Gulick told me before I prepared that affidavit of December 2, 1921, disclosures, but he told me he had made a piston of that claim prior to October, 1915, I think the date was, the date referred to in the affidavit, which was the date of filing of the application of the Schoengarth patent 1,170,092. I never took occasion to find out if Mr. Schoengarth probably had constructed anything previous to the filing date of that application. Of some of the things I have very good recollection because I have refreshed it from the files themselves, and on these things of whether they are the same or similar to a lot of other applications, it necessarily is faint. My memory has been refreshed on the amendments I have filed and the facts I prepared the application itself, and those are the initials on it. My memory was so fresh on Exhibits 36 and 37, the original sketch and description, that all I did was look at it and say, yes, that is what I saw, because I have seen them a great many times and I testified about them before. That is also true of Exhibit 32.

Q. But when it comes to the matter of an amendment involving important claims, you don't have any recollection of that? A. Because some of them I had nothing to do with except to sign them.

Q. Even though you signed, your memory is faint on that? A. I don't recall any such amendment.

Q. You don't recall any amendment you prepared; your memory isn't very fresh on that? A. I think so. I think I testified fairly well as to those particular amendments.

(Narrative continued) You may call my memory refreshed, but not fresh. I came here at the request of plaintiffs, and it was not necessary to subpoena me.

Mr. Bruninga: Cross examination closed.

Re-Direct Examination by Mr. McCoy.

Mr. Bruninga: I understand you won't rule on the production of these letters different than you have?

The Master: It will be the same ruling at this time.

Mr. Bruninga: How will the matter work out?

The Master: I said if you had anything further to submit and satisfied me that the rule was otherwise than I have indicated, before the case is closed, I will permit you to recall this witness.

Mr. Bruninga: In other words, he is still subject to call before the Court?

The Master: Yes.

Mr. Bruninga: So I understood.

(Narrative continued) The only explanation I can give of the time interval that transpired between the receipt by my office of the actions from the United States Patent Office and the filing of the several amendments that have been called to my attention, is that it was done in the usual course of business. There was certainly no undue delay. Most cases at that time would run from eight to ten or eleven months before we amended. That was quite the usual thing at that time in the office, when we had the number of cases we did in the office. When we were up to date at that time it even took six months, even if we would catch up. Even at this time it is four or four and a half months. That is quite the usual thing with my office as it is with everyone else's.

Mr. McCoy: That is all.

(At this point the testimony of Jeffries, Record pages 999 to 1027, was taken.)

(At 1:30 P. M., Wednesday, March 22, 1933, the following proceedings were had:)

(Thereupon, the defendants called as a witness, out of order, in surrebuttal, WALTER L. SCHOENGARTH, who, being first duly sworn, testified as follows:)

DIRECT EXAMINATION by Mr. Bruninga.

My name is Walter Schoengarth. I now live in Chicago, and before that I lived in Ironwood, Michigan. I came to Ironwood in the summer of 1912. I was born in 1885. I was in Ironwood, Michigan, very nearly all my time from 1912 until I moved to Chicago; I moved once to Hurley, Wisconsin, which is about a mile from Ironwood, just across the boundary line, and then back to Ironwood. I just moved to Chicago a week or so ago.

When I came to Ironwood, I started in automobile repairing work, for Harry Barr. He ran a garage, and his business was automobile repairing and selling machines. He first sold the Ford and then the Cadillac,

and the Overland. He handled Fords right from the start.

My work there was repairing cars, and finally I got to be foreman, shortly after I come there. I stayed with Mr. Barr until he sold out to Gale. I am not certain as to when that was; I think it was possibly in the early part of 1917; it may have been in the fall of 1916.

My experience previous to working for Mr. Barr, which qualified me to repair automobiles, was:—I did some stationary repairing on gasoline engines and had quite a bit of experience on steam engines, locomotive and stationary engines, and ran a locomotive at one time.

I became familiar with pistons before I went to work for Mr. Barr. That experience involved taking out, repairing and replacing pistons in automobile and stationary gas engines; I wouldn't say that included the Ford car so much. I did some of this work after I came with Barr.

I am the Walter Schoengarth who took out the Schoengarth patent 1,174,092, and that patent was granted to me. The attorneys who assisted me in securing that patent were Louis Bagger & Company, as shown on the drawing of that patent.

Previous to that patent, that concern assisted me in securing a reamer patent.

During the last month I have had some correspondence with that patent concern. I wrote in for some literature or information with reference to that patent 1,174,092, and they sent me some.

Q. I want to call your attention to a letter, original letter dated May 4, 1915, addressed to Louis Bagger & Co., and signed Walter L. Schoengarth, which I will mark for identification as Defendants' Exhibit 5-K1; do you recognize that letter? A. Yes, sir.

Mr. Bishop: Before you ask any more questions I would like to repeat my objections that this is not set up in the answer, and make an objection it is not proper surrebuttal testimony.

The Master: Same ruling on that.

I know Mr. Watts, who is in this room. I imagine I met him probably a month ago at my home. He came over there to see if he could get some information with regard to the patent that I had received. I had a complete conversation with him, and I talked freely with him. I did not try to hold anything back. I also talked

with Charley Garland and Edmond Stenstron, and another gentleman there. I couldn't say what date that was.

Mr. Bruninga: Is Mr. Watts willing to tell me what date that was?

Mr. Watts: Well, I would if I could. I can tell it by looking it up.

Mr. Richey: February 15th, wasn't it?

Mr. Watts: No, February 16th, of this year.

(Narrative continued) Another gentleman with with him. I do not know the man's name.

Mr. Richey: A. E. Redner, superintendent of the Ironwood Mine.

(Narrative continued) That was before you (indicating Mr. Bruninga) ever met me. You had, however, had a long-distance telephone conversation with me.

I recognize Exhibit 5-K1 as a letter I wrote on the day I have it dated, marked May 4, 1915. That letter reads as follows:

"Enclosed find $5.00 for first examination on invention which I call the adjustable piston. I am sending you model by express. Hoping it will be all O.K., I remain, yours truly, Walter M. Schoengarth."

I presume the model referred to in that letter was sent by American Express. I do not know where it is now. That model was constructed just like the constructions shown in the Schoengarth patent 1,174,092. The one that I sent was a wooden model, and I made it because I understood you had to make models with patent drawings in order to obtain a patent, to make it clear.

The "202 Frederick Street" was the place that I resided at that time. The postcript reading, "You will also find sketch and write-up on the same" was put on after I wrote that letter. Such a sketch was sent.

I made that tracing, Defendants' Exhibit 5-K2. I was able to make drawings in those days. I learned that when I worked as a rod man and transit man on the Soo Line, about 1917 to 1921. I finished that drawing, I presume, the day I made the date there, i.e., May 7, 1915.

That three-page description, marked Defendants' Exhibit 5-K3, is in my handwriting. I have read that description recently, and it refers to this drawing 5-K2,

I sent the drawing, or sketch, 5-K2 in a few days later than I wrote the letter of May 4, 1915; I must have held this letter for a few days until I had this drawing completed. The sketch 5-K2 and write-up 5-K3 are the ones referred to in the postscript of that letter.

Mr. Louis Bagger sent those three papers, 5-K1, 5-K2 and 5-K3, to me recently, at my request.

I remember receiving a letter, a carbon copy of which is attached to 5-K1, dated May 13, 1915, and which is marked for identification "Defendants' Exhibit 5-K4." I do not know where the original is, but I remember the contents of the letter.

The letter dated May 20, 1915, and marked "Defendants' Exhibit 5-K5" is in my handwriting. That letter states:

"Enclosed find $20.00 for preparation of papers on execution."

That $20.00 mentioned was the $20.00 asked for in Bagger & Company's letter of May 13, 1915, Exhibit 5-K4. I wrote that letter 5-K5 on the date thereof.

I remember receiving the original of the letter marked "Defendants' Exhibit 5-K6," which letter asked for $20.00. I do not know where the original of that letter is.

I wrote the letter dated July 29, 1914, which should be '15—I made a mistake. This letter is marked "Defendants' Exhibit 5-K7." That letter is in my handwriting, and it couldn't have been written in 1914. I have made mistakes in dates occasionally, and I suppose I made that error there.

I remember receiving the original of the letter dated August 5, 1915, and marked "Defendants' Exhibit 5-K8," which refers to my letter of the 29th ult., which is 29th of July, 1915. I am quite sure the date on 5-K7 should have been 1915.

(Short recess taken.)

That is my handwriting on the certified copy of the petition, certificate, oath and drawing as originally filed, of the application which matured into Schoengarth patent 1,174,092 (Defendants' Exhibit 5-K9). That is my handwriting above the oath and at the bottom of the oath.

That oath is dated the 27th day of July, 1915, and my letter of transmittal in which I sent the Post Office

money order for $35.00 has the date of July 29, 1914. That latter date should have been '15. That letter states:

"Enclosed find Post Office money order for $35.00 for patent execution on adjustable piston, also rough drawing showing adjustment. You need not change reading of execution papers only show in drawing that abutment is threaded to stud, also to end; the lug has a plain drilled hole; otherwise, O.K., am well pleased. Hoping to hear from you soon, I remain."

That adjustment I referred to in that letter is the one shown on the little sheet attached to the larger sketch. They didn't get that clear on this large sheet here, and I showed them again this was supposed to be threaded into that boss and a plain hole drilled through here. The studs were supposed to be threaded into the piston. The lugs with the studs threaded through were larger; they were free so they would slide through there.

The part sketch drawing is the one marked August 5, 1915, on Exhibit 5-K2.

Mr. Brumingo: I offer in evidence Defendants' Exhibits 5-K1, 5-K2, 5-K3, 5-K4, 5-K5, 5-K6, 5-K7, 5-K8 and 5-K9.

Mr. Richey: Insofar as they state facts which have not been proven otherwise than by the letters, we object to them as containing hearsay.

The Master: They may be received with the same reservation.

(Narrative continued) Charley Garland and I made that wooden model that I referred to in my letter of May 4, 1915, Exhibit 5-K1. I remember that model.

I made an actual metal piston of the character as shown in the patent 1,174,092, at the shop where I worked at Ironwood, in the spring of 1915. That was some time before the letter of May 4, 1915, transmitting that wooden model. As I stated before, the reason I made that model was because I thought it necessary to have a model for the Patent Office, to obtain a patent.

We made up four of these metal pistons for a model T Ford truck, owned by Sullivan & Cumbe, who ran a grocery store. Mr. Cumbe is dead, but Mr. Sullivan is still living. These pistons were no different from the piston shown in my patent 1,174,092, except that we left out that adjustment in the pin; that could be either with or without; that had nothing to do with this, it was just a

straight ordinary brass bushing. We didn't change the wrist pin bearing at all; we used this adjustable arrangement shown in Fig. 4 of the drawing. We used a Ford cast iron piston of standard dimensions, and welded the bosses in with an electric welding torch—or acetylene welding torch, rather. We welded on the boss D and the boss F. We then drilled right through both the lug F and the boss D, and threaded the boss D. I drilled a hole through the skirt at the bottom and at the top. At the top I welded on the lug C, and also the lug E. Then I bored right straight through. I also made a tap hole in the boss D.

We screwed the bolts 5, in Fig. 5, in with the nuts on them, and made the proper adjustment so we could make that larger—they were probably worn pistons—we opened them up so they would fit the cylinder wall. The upper slot 3 came from where it was shown in Fig. 1 to the other side, just about the same distance. The slot 4 was diagonal. It started from the top center and ran down around to the side, I don't know whether the right side or the left side, but down around to the side. It started about the center, where it would correspond to the upper adjustment, otherwise if it was through there we couldn't put that in. We adjusted them to the cylinder so they would fit, so they tumbled.

After we had placed those four pistons in the delivery truck of Sullivan & Combs, they ran it for a time and we watched it, oh, possibly five months, four or five months, and discovered that a real lot of noise developed, and discovered by taking the head off and the bottom off and taking the pistons off and examining it, one of these lower, this lower angle broke away. I mean in Fig. 2 the corner to the right of the section line 3-3 at the bottom. The other three pistons were running all right.

We were paid for the labor and time we put in making those pistons. It was in the spring of 1915 when we put the first set in. That was before I first wrote Bagger & Company on May 22, 1915.

Charles Garland, who helped me with that job, is at Ironwood, Michigan. I talked with him recently over the phone. I knew it was him because I know his voice, I heard his number called, and I talked with him personally. He is not in good health at present.

Q. What did he tell you?

Mr. Richey: I object to that as hearsay.

Mr. Brunings: Oh, no, that is not hearsay. I am trying to excuse why this witness isn't here.

The Master: I don't think you can do it by hearsay. He can tell what he knows about his health.

Mr. Richey: I know, if it is not hearsay, I am not objecting to what he knows of his own knowledge. I am objecting to what he was told.

Mr. Brunings: Suppose a man tells you, "I am not well."

The Master: I think he may answer to that extent.

Q. What did he tell you as to the state of his health, that is all? A. He was operated for hemorrhoids and he couldn't come. I asked him to come.

After we put those four pistons in the Sullivan & Cumbe Ford, I suppose we inspected them three or four times. I wouldn't say that we inspected them more than once, but I know when that noise developed, the time we made that other change, why, we discovered that piston broken. By "other change," I mean I put in a piston of the ordinary 1½ oversize, one and a half thousandths, that is, fifteen ten-thousandths, and sawed a slot clear across, the slot 3. We also made slot 4 almost perpendicular.

That slot 3 was almost all the way around, that is, one-half of the sphere, just as far as shown in Fig. 2, and in about the same position with respect to the bottom ring land.

That slot corresponding to the slot 4, started at the top center. It curved around just a trifle; we sawed it straight down, or almost straight down. We put a little slant in it to avoid a groove worn in the cylinder wall.

There were high spots in that one and a half oversize piston, particularly above the numerals 3', and around here down the side of the cylinder along near the wrist pin bosses, where we couldn't get it down through, I filed away. That particular piston does not have those adjustments in them that you see in Figs. 2 and 3. We put that in without the adjustments. It was actually put in the cylinder in place of the broken one. It had a tight fit and I used the general method that they used those days by using a grinding compound and lapping it in.

After that piston was in the car, the car was run. It probably ran for a year or better. I got paid for that job. That was, I think, about five months after the adjustable pistons were put in. It was in the fall of the year, because we had no leaves on the trees, but we didn't have snow. The time snow falls in Ironwood varies. I suppose we get snow in September to about the middle of October and the last of October, and it stays on the ground until the first of November, as a rule. In the middle part of November the weather is cold with quite a bit of snow.

I am sure it was before snow was on the ground that this slotted piston with the vertical slot was put in. That same year we put in a piston with the adjustment.

We filed the piston on both sides, in the region of the wrist pin boss, and we had to file it away around the part that is above the slot 3. I am quite sure we couldn't have gotten it in with fifteen thousandths over-size unless we had done that. We couldn't get a piston bigger than the hole in the cylinder without filing, especially where the lower part of the piston travels. The top of that piston was smaller than the skirt. That was the general practice in those days.

It was a new thing to file the piston to relieve it on the side opposite the wrist pin bosses, but we had used it around there occasionally; we had to use it at times. We had no means of re-boring and we had no machine for re-boring; so we lapped in our pistons. We discovered that by lapping them in we got a more or less funnel-shaped cylinder anyway by the time we got our piston down to the bottom; so we took the pistons and split them and ran something inside of them and put on the connecting rod, reversed on the connecting rod as it came out of the piston, and lapped our cylinders through that way. The slanted split shown in the drawing of this patent 1,174,092 is very easy to be explained; we had no means of putting adjustment in here without the connecting rod interfering with the lower adjustment. If we had made the slot straight and put that particular adjustment on the sides, the connecting rod would either bend or buckle up, or smash up the machine.

In the description, 5-K3, where it says: "Slot 4 is cut diagonally for two purposes: first, to prevent scoring; second, for convenience of getting at the upper and lower piston adjustments," we could not have placed that adjustment on the thrust or non-thrust side.

In explanation of the statement: in the description, 5-K3: "The piston is to be placed in motor as shown at motor view; this being for the purpose of keeping solid side of piston on explosion wall or the side of cylinder where the explosion or combustion forces piston against cylinder wall when on the power stroke, looking from the front slot on the right side. See view on motor view at right side of sketch" as the crank shaft rotates and the explosion occurs it shows, looking at it from the front, the thrust bearing is on the right side, on account of the angularity of this crank pin. I always thought that if that was slotted, that would be the proper way to install it.

We put adjustments in rather than leaving them off and just making the T-slot, because we had a lot of trouble with flutter and piston clatter, and I thought by cutting a slot in there and expanding it, we could probably take care of that flutter that was in the cars at that time, when the cylinder was worn.

Pistons cost money in those days. We had pistons in stock, but we had no means of reboring, as I mentioned, and lapping was an expensive thing. When the piston was replaced, we had to lap them out. If we were just looking for piston flutter, we took the bottom and the head off. To adjust for this wear, we planned not to take the whole engine down; we worked from underneath; you could leave the pistons right in the cylinders.

I never gave up that idea of making an adjustable piston and slit, even though the corner broke off.

I tried out another device about a year later, as my next development, where I used a perpendicular slot 4, and used two taper screws in it, and we installed this in that same job. We had a longitudinal and diagonal slot and almost a vertical slot, with a hole drilled right in the horizontal slot, tapered, with a boss on the inside; it is not shown here. By "horizontal slot" I mean the vertical slot 4.

That method of slotting differed from the one that we put in the Ford, in that it strengthened this corner here, brought this full skirt around. That piston had a horizontal slot around like 3 in my patent, and it had a vertical slot going down from almost the center, as near center as we could judge it. We attempted to spread the piston apart there by welding a boss on the inside of that vertical slot, one below and one above, and drilled a hole and reamed it out and put a lockwasher—no, a nut,

two nuts, on. One was a nut that drew it up, and the other was the jamb nut.

I do not know where any of those original pistons, like my patent, are, which we put in the Sullivan car. I have looked for them. Neither do I know where the piston is we replaced, the one in which the corner had been broken off. I also looked for that.

The next step of adjustable piston in which there was an almost vertical slot corresponding to 4, and tapered screws, that piston was put in that same job about a year or so later, and then a little later on in Jensen & Trier's car. I don't know what became of those particular pistons, however I have looked for them.

The pistons with the vertical slots were put in the Sullivan car about a year or so later; that was a set of four. It seems to me that model piston was cast instead of welded.

I had some pistons made like that installed in the Sullivan car, and I have just lately succeeded in locating one of them in my nephew's basement in Chicago. I gave it to him about fourteen or fifteen years ago, I couldn't give the exact time. I recognized the piston as one that I had made. I can produce that piston. (Witness does so.)

Mr. Bruninga: The piston is marked for identification "Defendants' Exhibit 5-K10."

(Narrative continued) That is the piston that I found in my nephew's basement. It was made some time in the fall of '16 or early part of '17. That was included in one of the sets; made in three sets.

Describing this piston, I made minor changes. I suppose I had better break this ring off. (Witness takes off ring.) I cut a diagonal slot under this lower ring so as to let any filings out of there or anything of that sort, and then I cut a slot, diagonal slot, through here, and drilled a taper hole to one side; I had to shove that to one side in order to put the rod in. In other words, that has a partially inclined horizontal slot, which is set a little to one side, in the lowest ring groove. These little pins are taper screw pins. The hole in the piston wall was tapered also. The piston then expands, opens up, expands the piston and opens up the skirt. You can do that by hand.

We had to place that slot a little to one side to clear the connecting rod.

I think these particular pistons were made in St. Paul, by the Burke Machine Company. I don't know whether they were in business then, or not, but my brother-in-law got acquainted with him when he was down there, and he said he could make up a few sets for me. I actually don't know where I got those pistons except what my brother-in-law told me.

That particular piston has a hole in it—that was very thin apparently, and when we rammed it down with a hammer handle, which we usually use, it caved the top in, and we had to replace it with another one. I remember putting that hole in that piston.

By placing the slot in the lower ring land, we didn't have to press down this top ring around it. We made that for another purpose, too. We thought also by covering up the slot it wouldn't leak down through, if I remember right.

I thought that it was an advantage to put the horizontal slot in the ring groove.

The leg and expanding construction was the same in Exhibit 5-K10 as it was in the pistons put into Sullivan's car. They also had a taper screw connection.

The letter dated April 2, 1917, addressed to Walter Schoengarth by Louis Bagger & Co., and marked for identification Defendants' Exhibit 5-K11, came from Washington, D. C., and is one that I must have brought along with me. That letter is addressed to me on Frederick Street, Ironwood, Michigan. I received that letter, and it has reference to this later type piston that I made, Exhibit 5-K10. It says here, "Notwithstanding this fact we advocate additional patent in a case like this because you really have a new and probably patentible feature in the way of these bolts and nuts, which by being locked in the slots and so forth, one may tighten and may spread or expand the piston." That letter refers to mine of the 26th of March, 1917; and it further states: "An express package containing model of one improved piston just received." I know I sent Louis Bagger & Company a letter, and also two models, the one of my original piston as shown in my patent 1,174,092, and later on another model. I am not sure what kind of model was sent to them in the second instance, but I think it was somewhere on the order of Exhibit 5-K10. It didn't differ any, only that it must have been the original cast iron model made up and sent to them. That piston model had a vertical slot like in the patent.

I do not know where my letter of March 26, 1917 is. I don't know whether that particular letter that is referred to was sent to me by Louis Bagger & Company with the rest of the correspondence. Just what we have here is all that he sent to me.

Referring now to the piston like Exhibit 5-K10 with the straight slot and the adjustment, if I remember right, I think there was possibly three or four sets of four made up. They were made up before I sent Louis Bagger & Company that letter to which this is a reply. I think it was in the spring of the same year.

With the exception of the broken piston Exhibit 5-K10, we replaced that set that was previously in Sullivan & Cumbe's job and then later on we put a set in Jussen & Trier's, then we put a single on No. 1 cylinder on a Ford. These I don't recall, because I lost some of the trade. That was later on, probably 1918 or '19.

I got paid for those jobs.

The piston in Sullivan & Cumbe's car ran fairly well. It ran up to 1925, but we neglected it for three or four years; I never paid any more attention to it until it got into a wreck; that is as far as I located the car, in 1925, I think. The car required adjustments in that period, but we never touched it. It worked fair, but our adjustments hammered out and we changed it later on.

These pistons were installed in that Sullivan & Cumbe car before I wrote Louis Bagger & Company that second letter in 1917.

My financial condition during 1917 wasn't very good. At that time I was making $2.50 a day. I didn't have any sickness at that time; but the sickness that really was serious was, I think, in 1914; my wife was sent to Rochester and I had a big doctor bill to pay there. It wasn't cleared up until about 1921. That was the Mayo Brothers in Rochester. I am not sure what the precise bill was, but I know it was over $300, approximately $350 or $450.

I had a hard time scraping up the $35.00 I sent in with my application in July; I didn't have an easy time scraping up any of it.

I do not know what delayed the filing of my application from July 29, 1915, to October 1, 1915. I expected it to be filed as soon as the attorneys got my money.

I do not know what this case is about.

My expenses are being paid here. You wired me $50.00 to cover all my expenses.

I have no interest in the outcome of this case.

Mr. Bruninga: Take the witness.

Cross Examination by Mr. Richey.

The function of those No. 7 lock washers, as shown in Exhibit 5-K2, I suppose, was to lock the adjusting nuts into position and the apparatus in its adjustable position, so it couldn't move.

That piston, Exhibit 5-K10, is more rigid than the piston shown in my patent, and the function of the screws or bolts was to adjust the piston, then lock it rigidly in position.

Mr. Bruninga: I want to offer in evidence Exhibits 5-K10 and 5-K11.

The Master: They will be received with the same reservation.

(Narrative continued) This wooden model I sent to Washington, I think, was about—I don't know whether smaller or larger, but it was a wooden model; I very distinctly remember that. I wouldn't say whether or not it was as big as a piston. I made so many different models, I made models in later years also, way back in 1917 and a later model I had been working on, I mean in 1927. The wooden model was as near as possible as I could make it to this drawing, Exhibit 5-K2. These parts here, I think, I am quite sure, was made out of actual metal, and it was screwed into the wood. I may have tapped it out; I am not sure. The model was partly metal and partly wood. That changed drawing is practically the same identical thing as the original; there is no difference; Louis Bagger didn't understand it, is all. There is no difference, only I just make the thread marks in there, and he thought I abutted this up against there, if I remember right, in the correspondence, and then I had to explain it thoroughly, and made a little zig-zag, identified that as a thread; that is the only thing.

The pistons that I made and put in that car were like this little drawing, because he didn't actually understand it. I had to send that in there.

Q. You told Mr. Watts last February that you didn't remember what part of 1915 it was that you made up that set of pistons that you said you put in Sullivan's car, didn't you? A. Well, we argued it out there that day; tried to get it as near right as possible, and we have argued it out later. Charlie Garland and Mr. Stenstrom and—

Q. Please answer my question. I asked if you didn't tell Mr. Watts at that time that you didn't remember

what part of 1915 it was that you put those pistons in the Sullivan car. A. Well, I don't remember for sure just exactly what I did tell Mr. Watts.

Q. You don't remember, although that was only a month ago or a little over a month ago, you don't remember it? A. Sure I remember that.

Q. That is, you weren't sure a month ago what part of 1915 it was that you installed these pistons in the Sullivan car? A. Well, that I couldn't say exactly. I know it was before that time.

Q. As a matter of fact didn't you tell Mr. Watts on February 16, 1933 that you didn't remember at that time what time in 1915 it was that you put those pistons in that Sullivan car? A. I suppose I did, if that is the day.

(Narrative continued) Since then I have talked to Mr. Brunings about this matter.

I also told Mr. Watts at that time that this second set of pistons wasn't installed until about 1917. I wasn't sure then what time in 1917 it was. I told Mr. Watts that I was certain this second set was not installed until after I moved out to my new house. We moved out to that new house some time in the middle of 1917.

I placed this first set of pistons, like shown in my patent, in the Sullivan & Combe car, and then that car drove out of Walter Barr's garage. I saw it occasionally after that. We probably inspected the pistons once and maybe twice; I am not certain about that. I can't remember that. We were keeping them under observation all the time, with the idea of finding out how they would work. We kept that up until the time we took that set of pistons out and put in the second set; and I looked at it at the time I made that other minor change where I cut that piston without an adjusting pin.

We took out the first set of pistons and put in the second set because that corner broke off and we had trouble with it more or less, and I naturally knew that the other arrangement that I had made, I thought it would work better. That is, I found that the first set wasn't working satisfactorily, so I put in the second set, which was an improvement on it. This didn't apply to all of the pistons, not of the adjustable type; three was in that car of the adjustable type and I had removed one and put in a plain one with just a diagonal and vertical slot, and then when we made this change, to continue with our adjusting devices, we installed this Exhibit 5-K10 piston.

We took all of them out of the car, including the one that didn't have any adjusting means in it, and substituted the pistons that had the adjusting means, because we thought that this 5-K10 was better than the others. It was better to a certain extent.

I also told Mr. Watts on February 16, 1933 that I wasn't even able to get the date when I took out the piston of the first set that broke; and I told him I was very much discouraged at the result of this piston breaking. I told him the truth about it.

That piston was 1½ thousandths oversize of the standard cylinder bore. At the time my patent was granted we didn't know very much about how cylinders spread; we probably lapped them in; we had no thickness gauge or anything of that sort. We put our pistons in, and when they were free we called them good. Some of them set on us because we didn't know; we had no instruments, no means of adjusting those things. Mr. Barr was very slack in getting good tools.

That same answer applies to the rest of the pistons on the question of clearance. We were careful enough about clearance to know when it wouldn't fit.

As to pistons like 5-K10, we would run that up until it would touch the cylinder wall and just probably use good judgment; that is all we ever used.

The first pistons we put in like those shown in the patent, we took old pistons and modified them and put them back in.

I arrived in Cleveland on this trip on Sunday morning, and I have been here ever since. I have been stopping at the Cleveland Hotel with Mr. Brunings. I have seen Mr. Brunings and Mr. Dorris. I have been with them right along, and have had meals with them.

I was making more money in 1917 than I was in 1915. I was getting $3.60 a day, and my wages were changed in 1917, the latter part, when I went to work for Gale, I got more money.

I had some of my debt to the Mayo Brothers paid off in 1917, but I didn't pay it very fast. My financial condition was slightly better in 1917 than it was in 1915.

The garage I worked in handled and repaired the Ford car in 1915. I suppose there were parts of old cars around there, but we had a stock of new pistons, rings, pins, rods, and so forth. We had old pistons around there as well as new ones, and presumably some that had been junked or on the verge of being junked.

I told Mr. Watts that it was a difficult job to make that wooden model, and it was a difficult job; there was quite a little labor to it. It didn't take me very long, of course, I presume, to make it, not any longer than it would now. I ran the lathe by foot power. It belonged to my dad.

The seasons vary in Ironwood as they do in Cleveland. We have four seasons, but our winters are very long. The last part of September we have a flurry of snow, but winter doesn't really set in until the last part of October or the first part of November. We never have any leaves on the trees in the latter part of October.

Q. If I say I was up there one year in October at the Ironwood mine and the weather was still clear and those yellow leaves were still on the poplar trees, you would say that wasn't so? A. Well, there might be such a thing, but conditions change; there may be some times we have early and some times we have a late fall, that is true.

(Narrative continued) When Mr. Bruninga handed me this letter 5-K11, I hesitated quite a little while before I recognized it.

Mr. Richey: That is all.

Re-Direct Examination by Mr. Bruninga.

I think I read that letter, 5-K11, last Sunday. I am not sure; I wouldn't say, Mr. Bruninga. I have really forgotten right now where I got that letter. I do know that I received such a letter; I was living at 202 Frederick Street at that time. Those other papers were received from Louis Bagger & Company a few days ago.

I recognize the envelope you have just handed me as one addressed to Mr. Walter Schoengarth, Hotel Cleveland, Cleveland, Ohio, and is marked "Hotel Cleveland" on the back and "March 21, 1933." Practically all this correspondence here was in that envelope, the correspondence being marked K-1, K-2, K-3, K-4, K-5, K-6, K-7, and K-8. I don't know whether or not 5-K11 was in that envelope; I don't think so; I am not sure.

I had not seen the papers K-1 to K-8, inclusive, that were in that envelope, recently before I saw Mr. Watts. I have not seen them in the last few years. I do not know whether or not I saw 5-K11 before the time I saw Mr. Watts.

Mr. Watts did not tell me who he represented. I did say that I discussed the whole thing freely with him. At the time that I talked with him I didn't have these specific dates given in these letters and various other exhibits K-1 to K-8, before me. I tried to guess at the month of 1915 as near as I could. These letters helped me considerably.

I remember that all of the trees, that the leaves should be fallen off the trees before October, because I know we went duck hunting, and it is very noticeable the leaves fall in October. I imagine I went duck hunting in 1915; I always went duck hunting; I can't be certain.

I had not paid off Mayos in 1917. I imagine I was getting $250 a day in 1917, if I remember right. My wife and my brother-in-law were dependent upon me at that time.

What I would call a standard piston in the Ford in 1915, if I remember right, was 3¾", that is the standard size, and it is bored out to the 3¾". I never milled it up, but we took that into consideration and if they wanted, when you had to put in oversize, those pistons we received ran all the way from 1½, 2½, 3, 5, and I think 10; I wouldn't say, 31; but we never used those larger ones at that time. I know they came in that size.

When I spoke of a standard piston, that meant a piston that fit freely, that had a clearance. A 1½ thousandth over-size piston was 1½ thousandths bigger in diameter than the standard piston; I wouldn't say for sure just exactly 1½; it may have been two thousandths, but I don't remember that exactly.

When we fit those original pistons in Sullivan & Cumbe's car, we adjusted the size so it fit in the bottom of the cylinder walls, and if it didn't drag too heavy, why, we called it good. We didn't use any micrometers.

When I told Mr. Watts that I didn't make that second piston like Exhibit 5-K10 until after I moved into my new house in the middle of 1917, I said that I had not looked at the letter of April 2, 1917, which letter was addressed to my house. That second model piston that I worked on is referred to in that letter. I was wrong when I told Mr. Watts that that particular piston had not been made until I moved away from 202 Frederick Street.

When I saw you after I had seen Mr. Watts, you told me to tell the truth as near as I could remember and the facts that I could get. You did not tell me what to testify. You did not tell me to be sure to fix the thing so you would win this case.

You particularly impressed upon me to tell the truth, and that was your method of doing business. You didn't try to change any of my dates that I had.

Mr. Brueninge: I offer in evidence envelope addressed to Walter N. Schoengarth previously referred to as Defendants' Exhibit 5-K12.

(Re-direct closed.)

Re-Cross Examination by Mr. Bishoy.

These papers came to me from Washington since I have been in Cleveland.

I made my wooden model before I sent in my patent. I told Mr. Watts that during that time I made the drawing. My drawing was sent in before I sent that in on that date, I am sure. I don't know what I told Mr. Watts about the wooden model. I don't remember just whether that drawing followed the wooden model or the wooden model followed the drawing; it must have been at the time, as near as I remember.

I don't correctly remember telling Mr. Watts that I made the set of pistons for the Sullivan & Combs car after I made the drawings.

I didn't say anything in any of these letters to my attorneys about installing any of these pistons in the Sullivan & Combs car prior to this Exhibit 5-K11.

Mr. Bishoy: That is all.

Re-Direct Examination by Mr. Brueninge.

I wanted my attorneys to take out a patent application, not look me financially.

Mr. Brueninge: That is all.

(Thereupon adjournment was taken to 9:30 a. m. of the following day.)

(Thereupon at 9:30 a. m., Thursday, March 23, 1905, the hearing was resumed.)

Mr. Brueninge: I want to make a statement, your Honor. There is another witness, Mr. Charles Garland, who was mentioned by Walter Schoengarth yesterday, who lives in Ironwood, Michigan. I intended to bring him here and I got in touch with him Sunday evening before Mr. Bishoy stated his position as to the Gulick Exhibits 48 and 51, and I found out that he had been operated on for piles.

He seemed to be in fair condition at that time. Then I wanted him to come here and he wired back that he couldn't; he thought he could come about Saturday, I mean that he could leave Friday night. His doctor told him he could leave Friday. Then I 'phoned him, both Mr. Gibsongarth and myself talked with him over the 'phone on Monday, last Monday, and I thought that he might be able to be here on Saturday morning, and then I found out, as Mr. Gibsongarth said, he had a relapse and in bed and in great pain, as they usually are in cases of that kind. I don't know when he can be here; at any rate he cannot be here this week. Now, this is not a case of sickness where we don't know how long a man is going to be ill; we know there is a definite recovery in the matter of days, not weeks. I am sure I can get him here the latter part of next week for such time as may be convenient to counsel. I may arrange it practically at the convenience of opposing counsel to bring Mr. Gerland here, rather than go up to Brentwood and take his deposition. Your Honor will see that his evidence will be very material in the support of Mr. Gibsongarth.

The Master: How long do you expect to use him?

Mr. Brundage: Oh, just a couple of hours, that is all. It will be just one day's session, that will be all there will be to it, except I understood plaintiffs' counsel wants to recall Mr. Jeffries for a short period, which I think they are entitled to have.

Mr. Bixby: I said I may want to recall him.

Mr. Brundage: That will be entirely agreeable to me, if they want to recall Mr. Jeffries.

The Master: Well, when we get done with these witnesses we will see.

Mr. Brundage: Your Honor, I want at this time to make a motion, and I will make it in writing if necessary, of leave to amend the answer in each of the three cases, amend paragraph 36 of each of the answers and set up the Gibsongarth patent 1,174,093, of March 7, 1916, and to set up Mr. Gibsongarth, under paragraphs 36, 36, and 37 of each of the bills of complaint, only as against the Gullik patent, and only as against those claims which are relied upon as having a foundation in Exhibits 48 and 51, and which counsel gave me notice of last Monday. I can

support that by an affidavit if necessary. I think the record is clear on that point.

The Master: Well, of course the practice in the state court, ordinarily, is that the pleadings may be amended to correspond with the proof. I assume that a similar rule prevails in the United States court.

Mr. Richey: I think the rule is that if the excuse can be shown for the delay, but the rules in federal court are designed to prevent surprise.

The Master: I understand that.

Mr. Richey: Now, where a man has known about the Schoengarth patent for ten years before this suit, or five years, and hasn't set it up in his answer, the question arises whether he has the right to rely on that as newly discovered evidence. Well, we don't oppose it anyway.

The Master: Then it may be received, and you may file your amendments, in regular form so that they will be a part of the pleadings.

Mr. Brumings: I will do that. I can do that in each one of the suits.

Thereupon the plaintiffs recalled as a witness in rebuttal ZAY JEFFRIES who, having been previously sworn, further testified as follows:

DIRECT EXAMINATION by Mr. Richey.

Q. Doctor, you testified in this case before? A. Yes.

Q. You were present during the time Mr. Gulick was testifying? A. Part of the time.

Q. You heard some testimony here regarding the character of tests that are given aluminum pistons from him? A. Yes.

Q. What if any experience have you had directly or indirectly in connection with the testing of aluminum pistons to determine whether or not they should be put into use? A. Since the latter part of 1915 I have had considerable experience with reference to trying to make aluminum pistons stay sold. In that process I have witnessed various kinds of tests, at various places, and examined a great many pistons, after block tests and after road tests. I have also run road tests on pistons.

Q. Now, will you state just what are the character of tests that are employed to develop the characteristics

of a new piston to determine whether or not it shall be used commercially, and give your reasons for the tests as far as you know? A. A great many factors, of course, enter into the adoption of a piston for standard. Among the factors, and a very important one, is the cost of the piston, and I will consider principally the engineering features. The first step is what is known as a trial test of some sort. At the present time and for a good many years that trial test has usually been made on the block. The trial may include a good many changes of conditions during the early stages of the test, such as putting the pistons in with a clearance considered to be too little for proper operation, and then running the motor for a little while to see at what point the pistons seize or rub too hard. Then the pistons may be taken out and given additional clearance and run again. After the proper clearance is found in that way, then a block test for endurance is usually run. If that is satisfactory, then the piston is usually put on the road. The road test is usually a fairly long and a fairly severe one, and among other things, it is best to have the road test carried on throughout an entire cycle of temperature changes, that is, it is desirable to have tests in the winter time and in the summer time as well in order to make certain that all of the varying conditions encountered in service are satisfied. There is no particular standard of acceptance; it depends a good deal on the nature of the change, on the magnitude of the change. If it is a change of a small nature, it may not require so much testing to prove it in. A more radical change might require more testing. Furthermore, the matter is pretty much an arbitrary one because it is settled by human beings: the engineers of the engineering staff, if it is an engineering matter, or perhaps the purchasing department, if it is a matter of economics.

Q. What is a normal mileage on outdoor tests to test out pistons such as these split skirt pistons?

Mr. Bruninga: Now, or in 1911?

Mr. Richey: Well, say as early as you knew anything about it?

A. I don't know as I could name any normal mileage.

Q. Why is it that these pistons have to be tested out thoroughly before they go into use? A. Because they must function satisfactorily under a great variety of conditions, and they must endure. The pistons must not

break; they must be serviceable over a relatively long period of time.

Q. Now, would you look at the Schoengarth patent 1,174,092 and state whether or not you have read that patent over and are familiar with the disclosure? A. Yes, I have seen this patent before and have read it.

Q. Now, will you compare that in structure, mode of operation and results with the disclosures of each of the patents in suit? A. The Schoengarth patent 1,174,092 relates to a piston which is adjustable in diameter. The piston is so slotted, horizontally and spirally, or approximately vertically, as to permit the skirt to be changed in diameter a small amount. The slotting of the skirt is not designed to change the diameter of the piston skirt by flexing when the piston is in operation. In that respect the Schoengarth piston has no relation to the Gulick construction, the Jardine construction, or the Maynard construction, the pistons in all of which are intended to flex while in the motor. The object of the Schoengarth piston is fairly obvious. When a motor is new the piston is properly fitted; when the motor has been run a certain distance, the cylinder barrel wears and the piston skirt wears; in due course the clearance between the piston and the cylinder may be too much for proper operation. Schoengarth aimed to make the piston last longer by providing an adjustable skirt so that when the clearance became more than was desirable, the piston could be removed from the cylinder or as he states, even adjusted while in place by means of locking rings and nuts so placed in the inside of the piston skirt that the adjustments could be made. After the adjustments were made, the piston became a rigid type piston, the same as when it went into the motor in the first place, or the same as any other conventional non-slotted piston.

There is another feature of the patent which need not be considered, namely, the adjustable bearing in the pin boss. The Schoengarth piston would in fact be more rigid than the ordinary piston because of the size and location of the locking rings. It would also be heavier and it would be what is known as a composite piston, that is, one composed of more than one part. The piston design itself is not important in the Schoengarth disclosure; so it has no relation to the Schmiedeknecht patent. The nature of the locking rings and the absence of relief would, among other things, make the piston have no relation to the Moore patent in suit. Even if the locking

rings were omitted,—and no suggestion that they can be omitted or should be omitted is contained in the patent, at least I saw none,—the Schoengarth piston would still not be similar to any of the patents in suit. No relief from the slot to the bottom ring groove, no relief from the horizontal slot in the bottom ring groove in the Schoengarth piston is described or suggested, and there is no relief described around the bore section. In my opinion therefore, the Schoengarth patent has no relation whatsoever to any of the patents in suit.

(Adjournment thereupon taken to 1:30 p.m. of the same day.)

(1:30 p.m., Friday, March 17, 1933, the hearing was resumed.)

Q. Now, Doctor, you have discussed the Schoengarth piston without adjusting means in it, and structure. Will you also take up the question of operation and results as compared with the patents in suit? A. The Schoengarth piston, without the locking rings, would not operate like the pistons of the patent in suit nor would it produce the same results.

Q. And would you give your reasons for your answer? A. The place on the piston where flexibility would be most needed to help against wall pressures, would be the section just below the lowest ring. This section on the Schoengarth piston would have the full skirt diameter and would not be flexible, nor could the diameter be decreased by distortion in any direction without increasing the diameter in some other direction. The piston would have flexibility at the bottom of the skirt, where it would not be needed, and no flexibility at the top of the skirt, where it is most needed, and absolutely necessary if the clearance is not made sufficient to operate without need of skirt flexibility.

Q. Now, you were here and heard Mr. Gulick testify about the pistons that he had tested out and heard him describe those pistons and what the tests were and how they operated during the tests, were you not? A. Yes, I heard most of that testimony with reference to operation and the construction of the pistons.

Q. The one of them in 1911 and one in 1914, you heard about those two, didn't you? A. Yes.

Q. Now, would you compare those pistons in structure, mode of operation and results, with the piston as it is shown in the Schoengarth patent 1,174,092? A. The

Gulick 1911 piston, according to his description, would have one horizontal slot and one vertical slot. The horizontal slot, as I understood it, would mark the top of the skirt. That is, the head relief extended from the head proper down to the horizontal slot. This would divide the piston into two parts; one of which would be non-flexible, but with relief, and the other part flexible, with no relief. The skirt flexibility would be gained as a result of the vertical slot which in the Gulick piston Exhibit 48 extends from the horizontal slot, near one end of such horizontal slot, spirally around the piston skirt, ending, say, about 1¼" from the vertical line drawn from one boss to the bottom of the skirt. The Gulick piston would have a flexible skirt, more flexible at the bottom than at the top of the skirt, but nevertheless the skirt would have flexibility throughout its bearing length. In the Schoengarth piston there is no flexibility of the skirt when the piston is operating in the motor. So that the Schoengarth piston is a rigid type piston, as it is used, and the Gulick piston has skirt flexibility with head relief properly placed so that the skirt flexibility would have opportunity to function to compensate for extra expansion of the piston. The 1911 piston, apparently, had no relief in the skirt section around the bosses, and to the extent that it had no such relief, it would not permit of as much compensation for extra expansion as it would have had the relief been placed around the bosses; but nevertheless, it was a cast iron piston and the expansion problems were not as severe in cast iron pistons as in aluminum pistons, and therefore the Gulick 1911 would function, to a degree at any rate, as a flexible skirt piston. The Gulick 1914 piston, as shown in Exhibit 51, is a flexible skirt piston with the horizontal slot extending completely around the skirt. With the one vertical slot on one of the thrust faces, between the bosses, the Gulick 1914 piston would operate as a flexible skirt piston. This assumes that the head section is relieved by machining to a smaller diameter than the skirt section, and that the horizontal slot marks the boundary between such relieved section and the skirt section proper, which I understand is the construction in Exhibit 51. This Exhibit 51 piston is considerably more flexible at the top of the skirt where flexibility is most needed than is the Gulick 1911 piston. Not only does the Gulick 1914 piston have more flexibility than the Gulick 1911 piston because of the greater length of the horizontal slot, but the web or rib construc-

tion is such as to make possible some compensation for expansion by distortion of the skirt section as the result of cylinder wall pressure. None of these factors are found in the Schoengarth patent and, consequently, the Schoengarth piston differs from both the Gulick 1911 and the Gulick 1914 pistons in construction, mode of operation and results.

Q. With respect to method of testing pistons, say back in 1914 and '15 when you first became connected with this matter, not only pistons but automobile equipment, will you state whether or not to your knowledge it was customary for engineers and employees of the company to test things in their own or factory cars? A. Yes, it was.

Q. Now, in the testing of such a piston, what is considered in this industry as the termination of the test and the dividing line between the test and the commercial activity with respect to the piston? A. Either when the test is declared to be finished and a conclusion reached one way or the other, or when the device which is being tested is adopted or used as standard.

Q. And what physical act takes place with respect to the running of the device at those dividing lines? That is, perhaps you don't understand me. What I mean is, state whether or not the device is continued to be tested when you come to that dividing line. A. Oh, additional tests might be made; but I should say that if you were making one test on one device and the test is concluded and report is made, it is either satisfactory or it is not satisfactory; if it is satisfactory presumably the part is accepted for standard.

Q. Now, you heard Mr. Gulick testify yesterday as to the tests he made on his 1911, 1914 and 1915 pistons. Will you state whether or not from your experience and observation of tests of pistons of that character, the operations he performed, the miles he ran, exceeded what was necessary to make the proper tests on those pistons?

Mr. Bruninga: I object to it, first, because the witness cannot testify what was the practice in 1911 or even in 1914; he didn't come into this field until December, 1915.

The Master: I understood his services began in this branch of the science after the war was declared.

Mr. Richey: There would be no material change.

Mr. Bruninga: That goes to the weight of the answer.

Mr. Richey: To the weight of the answer, yes.

The Master: With that limitation he may answer.

A. The one thing a piston must not do in service is to break. When a piston breaks, it is quite apt to cause so much damage to the car that an expensive overhaul becomes necessary, or even the motor may be wrecked. So that I should say that these pistons certainly were not run further than was necessary to determine their durability.

Q. And by durability, you mean their ability to go without breaking? A. Yes.

Q. That is, to perform their desired function so as to prove their utility with respect to breaking? A. That is true.

Q. You were here when Mr. Monckmeier testified about these Exhibits 3-V and 3-W, weren't you? A. Yes.

(At this point the testimony of Tibbetts, Record pages 859 to 877, was taken.)

(At 9:30 a.m., Saturday, March 18, 1933, the hearing was resumed.)

ZAY JEFFRIES, being recalled, further testified as follows:

DIRECT EXAMINATION by Mr. Richey.

Q. Now, will you compare each of the Exhibits 3-V and 3-W, the pistons that were produced by Mr. Monckmeier, with each of the patents in suit, in structure, mode of operation, and results? A. Considering the Monckmeier iron piston, Defendants' Exhibit 3-V, I think it would be desirable to find by micrometer measurements certain dimensions on the piston. I have here a micrometer which measures distances between four and five inches readily to the nearest thousandth of an inch. This is the micrometer which is used regularly in the laboratories of the Aluminum Company of America at Harvard Avenue in Cleveland for such measurements. The first measurement which I am making is the diameter of the piston across the boss region just below the boss holes.

This diameter is 4.479". The next diameter is the one across the boss region but just above the boss holes. This diameter is 4.478". The next diameter is across the bottom ring groove, the width of the groove being small enough so that the micrometer surfaces engage at the same time both edges of the groove. The diameter is 4.479". This groove is above the horizontal slots in the piston. The next measurement is across the boss diameter but of the second narrow ring groove. The term "second" in this case indicating the uppermost of the narrow ring grooves, and the other narrow ring groove is the lower of all the ring grooves. This diameter is 4.477". The next measurement is still parallel with the bosses but across the land between the top ring groove and the ring groove with semicircular cross section, which may be called the second large ring groove. This diameter is 4.475". The next measurement is across the top land, parallel with the bosses, the measurement being about 4.467".

Q. These last measurements were made in which direction? A. All the measurements up to this point have been made parallel with the line drawn between the two bosses. I will now make some diameter measurements in a direction approximately at right angles to the previous measurements, namely, across the thrust faces of the skirt portion and in a similar direction across the head. The first measurement in this direction is across the top land or across the head section; this diameter is approximately 4.467". The diameter in the same direction across the first land is 4.469". Across the top narrow ring groove, in the same direction, it is 4.468". Across the bottom narrow ring groove just above the ends of the vertical slot the diameter is 4.472". Just below the horizontal slot and across the ends of the vertical slot, the diameter is 4.471". In a horizontal plane, this diameter would be just above the horizontal section taken across the tops of the boss holes. The next diameter, which is just below the horizontal section but in the line immediately below the boss holes, the diameter across the thrust faces is 4.476". These measurements would indicate that if the piston had been fitted in a cylinder 4½" in diameter, the clearance would have been .030" in the skirt section, and at the bottom narrow ring and also at the top narrow ring. The measurements would also indicate that there was no boss or side relief on the piston at the time of machining. The measurements

would also indicate that the piston had been run in a motor and the wear across the thrust faces has been considerable. The measurements also indicate that the real division between the head section and the guide section in this piston is at the upper narrow ring groove, which is more than ¾" above the horizontal slot. The fact that the guide section of the piston extended at least up to the upper narrow ring groove is indicated not only by the measurements parallel with the bosses where the wear would have been a minimum in the operation of the motor, but it is also indicated by the measurements across the thrust faces which indicate the elliptical nature of the head section up to the upper narrow ring. Had these ring land portions not been bearing against the cylinder wall, they would not have worn to the extent indicated by the measurements. Comparing this piston with the Gulick patent in suit, then, I would say that it does not have the construction of the Gulick patent in suit, it does not have the mode of operation, nor could it give the results of the Gulick patent in suit. The Gulick patent in suit describes the division of a piston into two parts. For example, as stated beginning line 41 on page 1 of the Gulick patent: "Referring to the drawings, 10 represents the head portion of a piston, and 11 is the skirt or guide portion which is shown as separated at its periphery from the head, leaving an annular slit or opening 12 there between." The skirt or guide portion of the Gulick patent is the portion which bears against the cylinder wall. The head is not supposed to bear against the cylinder wall; if it did, it would become part of the guide section. Gulick therefore shows the horizontal slotting separating the head section from the guide section, and the vertical slotting in the guide section only. The Gulick piston can function to compensate for excessive expansion because the head section does not serve as a guide; that is, does not touch the cylinder wall, and the skirt or guide section is made flexible so that it can compensate for extra expansion as the piston heats up.

The Monckmeier cast iron piston could not function in a motor like the Gulick piston. The slotting in the Monckmeier piston is to my mind absolutely useless and could be nothing but impairment of the piston in its functioning, except that the great distortion of the cylinder barrel in its lower portion might permit the bottom of the skirt to adjust itself more readily to the distorted

contour. In so far as clearance is concerned, in the Monckmeier cast iron piston I have made a calculation which is very simple, showing that if the cylinder barrel was 4½" in diameter, as suggested, the clearance would be at least 20 thousandths of an inch in all diameters, and the piston would have to become 700° F. hotter than the cylinder before seizure due to high piston temperature could result. In this piston 3-V, long before the slots could have any opportunity to be any help in this piston, the ring land portion, that is, the lands adjacent the narrow rings, would seize against the cylinder walls. These ring portions would be much hotter than the lower portions of the skirt and hence would expand more than the lower portions, merely because they are hotter, and because originally they were the same diameter as the skirt portions, those portions must rub against the cylinder walls first. Those land portions adjacent the narrow ring groove therefore were the true guides of the upper portions of the Monckmeier cast iron piston.

Considering the piston from the standpoint of the Mocers piston, there is no combination of horizontal slotting and skirt or guide section relief as in Mocers; so the Monckmeier piston can have no bearing on the Mocers patent.

Considering the Schmiedeknecht patent, there is no suggestion that the Monckmeier patent has anything to do with the Schmiedeknecht construction; the two constructions are different.

Considering the Jardine patent in suit, the Monckmeier cast iron piston can have no relation to it, as I see it, because the Jardine patent combines the relief of the head section down to the guide section. On page 1, line 87 of the Jardine patent, is found the following: "The flange 4 of the head portion which has a smaller outer diameter than the guide portion 2, the diameter of the latter being slightly smaller than the internal diameter of the cylinder in which it is to function"—so that the Jardine patent clearly describes the head portion as being of smaller diameter than the guide portion, and the guide portion being separated from the head portion by the horizontal slots. Furthermore, the Jardine construction relates to relief around the boss section which is not provided or found in the Monckmeier piston. Therefore the Monckmeier piston has a different construction, different mode of operation and gives a different result from the Jardine construction.

Considering the Maynard patent in suit, the same things as said of the Jardine patent apply. This matter of the separation of the head section from the guide section is shown in an exaggerated way even in one of the drawings of the Maynard patent in suit, Fig. 3. The horizontal separation is shown at E, and the skirt or guide section at D, and the head section at B. The very substantial difference in diameter of the head section and the skirt or guide section separated by the horizontal slot, is clearly shown there. The Monsknieier piston therefore has a different construction from the Maynard piston; it has a different mode of operation from the Maynard piston, and it gives a different result from the Maynard piston.

Q. Before you pass to the next piston, this 700° difference in temperature, will you state whether or not that would occur in the operation of an internal combustion engine under normal conditions? A. No, it would not.

Q. Would it occur at all? A. Not without burning up something very badly.

Q. Now, you said that you thought that this piston, Exhibit 2-V, had been used. Will you state whether or not you think it has been used with slots in it, and give your reasons for your answer? A. Of course I will say at the outset that I don't know whether it has been used after it has been slotted or not, but the indications are strongly to the effect that the slots have been put in after the piston has been used. These indications are, first, the very small bridge or web of metal at the top of one of the vertical slots. The chances are that if that piston had been used after the slotting, that that web would have broken up. Also the piston shows carbon collection in various places. It shows that there has been an attempt to remove the carbon deposit. It has mostly been removed from the piston, but you still find carbon deposit on the head. You find carbon deposit in the ring grooves, and you find carbon deposit just above the boss on one side, but you find no carbon deposit that can be seen, even with the hand glass, in the slots. Furthermore, the slots look surprisingly alike, merely machined surfaces that have been rusted by standing around. So that I should say that the evidence on the surface of the piston is more in the direction that the piston had never been run after the slots had been put in.

Q. These pistons here that were put in by defendant, Exhibits E, F, and B, for example, you can tell they have

been run, can you not, by the carbon deposit? A. Yes; not the slightest doubt about that.

Q. And compare the condition of the slots in those pistons, particularly with respect to carbon deposit, with that of Exhibit 3-V. A. Well, the carbon deposit in, say, Defendants' Exhibit E, can be seen on the cut surfaces.

Q. Which cut surfaces do you refer to? A. The slotted surfaces, as well as on other parts of the piston.

Q. What have you to say in the use of slotted pistons with respect to whether or not the carbon does deposit in the slots when they are used? A. Well, the carbon is apt to deposit on any surface that gets hot enough, where there is oil. Now, whether it is cleaned off entirely or can be cleaned off entirely by some abrasion method afterwards, that is a matter which I am not so familiar with.

Q. Well, what about where there is a large clearance, as in this Monokmeier piston, would there liable to be more or less carbon deposit than where there is a small clearance? A. There should be more carbon deposit where there is a large clearance.

Q. Now, will you answer with respect to Exhibit 3-W the same question? A. In the first place, the Exhibit 3-W, which is the Monokmeier aluminum piston, is so mutilated that it is difficult to gain such a complete story as the iron piston reveals. It is possible, however, to take diameter measurements across the boss region, the first one of which I will make is just below the ends of the boss holes. The diameter is about 4.473". There is then a band, which is machined around the entire circumference of the piston of smaller clearance than the remaining portions of the skirt. The diameter in this portion is 4.422". Just above this band there is another portion of the skirt of larger diameter which is 4.473". Then the diameter of the land between the two ring grooves is about 4.470". The diameter of the land adjacent the head is 4.464". The diameter of the head at right angles to the line between the bosses is about 4.461". The skirt is completely broken away on one of the thrust faces, so no measurements can be made there. Judging from the measurements, however, it seems clear that the original clearance of the skirt section just below the bottom ring groove, and the remainder of the skirt section with the exception of the relieved portion previously mentioned, were originally machined to the same diameter. There is only enough metal in the piston to make a measurement across the thrust faces, at the skirt portion

adjacent the lower ring groove. This diameter is 4.464". It seems fairly clear, therefore, that the Monckmeier aluminum piston has a division line between the head section and the guide section at at least not lower than the bottom ring groove. The horizontal slot therefore in the aluminum piston would be placed in the guide section proper rather than at the division between the guide section and the head section, some ¾" below the top of the guide section proper. This is indicated by the measurements across the boss region, where the diameters would be expected to remain more nearly the same as the original diameters, and also by the one diameter measurement across the top of the skirt at the thrust faces, indicating, if anything, that the piston has been worn at the top of the skirt on the thrust faces. If it has been worn by use, it is proof that the head section does not run down to the horizontal slot. Considering this Defendant's Exhibit 3-W, or the Monckmeier aluminum piston, therefore, with reference to the patents in suit, it does not have the same construction as Gulick, nor the same mode of operation, nor can it give the same results, for the reasons given in connection with my discussion of the Monckmeier iron piston Exhibit 3-V. This Monckmeier aluminum piston can have no relation to the Meoers piston, because the horizontal slotting is not combined with the relief around the division between the head section and the guide section. There is no horizontal slotting in the Monckmeier aluminum piston at the division between the head and the guide section, as is called for in Meoers. The Monckmeier aluminum piston does not have the same construction, nor the same mode of operation, nor can it give the same results as Jardine, for the same reasons given in connection with my discussion of Exhibit 3-V. The Monckmeier aluminum piston does not have the same construction, nor does it have the same mode of operation, nor can it give the same results as the Maynard construction, for the reasons given in my discussion of the Monckmeier piston 3-V.

Q. You have heard Mr. Monckmeier testify as to the clearances that were used with this aluminum piston, did you not? A. Yes.

Q. Have you made any calculations to determine how hot the aluminum pistons would have to be with those clearances before there was any operation due to the slotting? A. I started to make a calculation on the basis of the diameter of this piston, 3-W, but if the piston was used there was probability of a cylinder re-grind

before it was put in, which would make any calculation impossible. However, considering merely the dimensions of this piston on the basis of a 4½" diameter cylinder bore, it would have to become some 450° F. hotter than the cylinder before rubbing would take place or before seizure could occur. But this piston has more clearance than was given even the 5" aluminum piston in the Liberty motor, so that it seems to me likely there would be no chance of this piston seizing in a motor even if it had never been slotted, even if the slots had been put in properly so that they could function; but this piston Exhibit 3-W would seize at the top of the skirt just as quickly or a little more quickly with the slots in, as with the slots out. I say a little more quickly because the top of the skirt would become a lot hotter with the slots in than with the slots out, and therefore the slotting of this piston could not have had anything to do with prevention of seizing.

Q. The question came up yesterday about, with respect to the matter of slapping of pistons in the Liberty motor. Are you familiar with the use of the aluminum pistons in the Liberty motor? A. Yes.

Q. Will you state whether or not they were slotted, if you know, and if not, why not? A. They were not slotted. They were not slotted, because the object is to get as much power as possible from the aircraft motor, and the power is not helped by this slotting. The power is impaired somewhat by the slotting. Furthermore, these pistons in aircraft motors are subjected to tremendous mechanical forces in order to develop the large horsepowers that they do. So that mechanical strength is more important in an aircraft motor than it is in a pleasure car motor. I don't mean that it is not important to have strength in motor car pistons; but I mean that the aircraft motor pistons are subjected to higher stresses than the pleasure car motor pistons. So that the aircraft motor pistons are not even slotted today.

Q. Well, is the matter of piston slap of any importance in aircraft? A. No, it is not.

Q. For that reason, what clearance is used in airplane motors? A. Generous clearance is used, enough to make certain that there will be no seizure or hard rubbing of the piston against the cylinder wall.

(Recess taken.)

Q. I call your attention to Defendants' Exhibit 4-G, the article by Mr. Gunn on "Aluminum Piston Design." Did you know Mr. Gunn? A. Yes.

Q. Who was he? A. He was chief automotive engineer for the Premier Company in Indianapolis when I first became acquainted with him. He later became associated with the Aluminum Castings Company or its successor company, and still later went to Packard Motor Car Company.

Q. Do you know in any way how familiar he was with the aluminum piston problem back in 1920? A. Yes, he was very familiar with the problem. He did work on the problem for the Aluminum Castings Company or its successors.

Q. And about when was that? A. I think somewhere about the close of the world war and for some time thereafter.

Q. Now, will you look at his article and the pistons shown therein and state what the purposes of the various designs are and what the history of them is so far as you know? A. This article deals particularly with aluminum piston design; its also treats more particularly of the aluminum piston design for passenger car engines, as indicated by the headline on the first page of the article, page 362. The pistons are designed, according to Gunn, with two principles in mind: first, it is designed with the object of conducting heat away from the head into the skirt and thence into the cylinder walls; and second, it is designed with the object of partly insulating the skirt from the heat of the piston head. He outlines the problem and considers some heavy duty engine pistons first. Those are described in drawings, Figs. 1, 2, and 3. These pistons have fairly heavy webs or ribs to conduct the heat away, especially Fig. 1. Fig. 2 has an excessively heavy head and ring land section to conduct the heat away. Fig. 3 is apparently a piston designed to have some kind of cooling medium put into holes extending from the bottom of the skirt up to near the head. Whether the medium would be mercury or sodium or what, I believe is not stated, but the idea is that something can be put in these holes to collect the heat from the head of the piston and carry it down to the skirt. Then he describes some other types of pistons. Figs. 4 and 5 are two other types. Fig. 5 was known, I think, as the hour-glass type of piston. I don't see anything distinguishable over ordinary pistons in Fig. 4. Fig. 6 is the Ricardo type piston, which has already been referred to in this case. Fig. 7 is the Aluminum Castings Company double-walled skirt piston, which I referred to in the examination in *prima facie*.

Fig. 8 is apparently a piston of the Long type, with the six vertical slots and internal webs, being a double walled skirt structure. Fig. 9 is the Franquist type of piston. Fig. 10 is a composite piston; and Fig. 11 is a piston with heat-insulating material put into the head section, that is, the head section is made hollow, and some material like infusorial earth is supposed to be put in the head section and then a solid covering put over that, so that the heat cannot be conducted readily from the head into the remaining parts of the piston. I think this article describes the problems pretty well and represents the efforts made to solve the problem, without, however, getting very far in the direction of giving the public any real solution of the aluminum piston problem for pleasure car purposes.

Q. You spoke of the piston shown in Fig. 8 as being of the Long type. Is that the same as or different from the pistons Exhibits F and E? A. Seems to be about the same with the exception of the rib in the head, and the drawing in the Gunn article shows no boss relief.

Q. What about the relation between the webs and the bosses? A. Oh, yes, one of the bosses in the Gunn article is attached only to the skirt portion and not to the web portion, which is not the construction of the Exhibits E and F.

Q. Do you know why that change was made in Fig. 8 over the Long piston? A. I suspect it may be drawn in there as a means to compensate for expansion across the bosses.

Q. Now, did any of these pistons illustrated in this Gunn article come into successful commercial use? A. I think it might be said that some of the trunk type pistons were successfully used commercially prior to the introduction of the flexible skirt pistons.

Q. Which ones, for example, illustrated in this article? A. Well, not any specifically as illustrated, but Fig. 1 was not far different from the ordinary trunk type piston used.

Q. That is, used in trucks mostly? A. Yes; but it had been used in pleasure cars, too, to an extent, prior to the introduction of the flexible skirt piston.

Q. That didn't cure the slapping? A. No, the slapping was endured; it wasn't cured. So far as I know, none of the other pistons were brought into commercial use, successful commercial use.

Q. Would you state whether or not this article fairly represents the efforts to solve the piston problem at that

time that went so far as to become tested out seriously and then failed? A. I think it does, yes; it gives a fairly good representation of it.

Q. Now, will you next take up the Van Bever patent 1,031,212 and compare the piston illustrated and described in that patent with each of the patents in suit as to structure, mode of operation and results? A. This patent is another one of the lock ring constructions, somewhat like the Schoengarth patent, only the adjustment here is only at the bottom of the skirt. The object is stated, beginning line 15 in the patent as providing a means to enlarge the skirt of the piston after it has worn down to a certain extent and after it has become loose. The skirt is given four vertical slots, each slot being approximately at 90° from adjacent slots, and the ring 17 is screwed into the inside of the bottom of the skirt with a tapered thread. By these means the skirt can be expanded to a larger diameter at the bottom. That appears to be the object of Van Bever in this patent. He does not have a flexible skirt piston, even at the bottom of the skirt; that is, the skirt does not flex during operation. It seems to me, therefore, that the piston being different in construction and mode of operation and results from those of any of the patents in suit, that it has no bearing whatsoever on any of the patents in suit.

Q. Now, will you answer the same question with respect to this piston, Exhibit B? A. Exhibit B has four approximately vertical slots extending to a point in the skirt section a little above the top of the boss holes. This produces flexibility in the bottom of the skirt section, but none at the top of the skirt portion where it is really needed. This Exhibit B piston therefore is not a flexible skirt piston from the standpoint of the constructions of the patents in suit. It merely provides some flexibility at the bottom of the skirt where it is not needed, and the skirt at the top where it should be flexible in aluminum pistons for pleasure cars, is rigid, has no flexibility, and the skirt has no horizontal separation from the head section. So Exhibit B does not have the construction of any of the patents in suit, does not have the mode of operation of any of the patents in suit, and it does not give the results of any of the patents in suit.

Q. Will you next take up the patent to Vincent 1,279,134 and compare that with the patents in suit in the same way? A. The Vincent patent relates, for the greater part, to what is known as composite pistons,

that is, pistons composed of more than one part. There are several types shown in the drawings, only one of which, with the exception of a ring, can be regarded as a one-piece or integral piston. That is shown in Fig. 7. The construction shown in Fig. 7 is supposed to operate in such a manner that an internally expanding ring forces the bottom of the skirt toward the cylinder wall. There are four slots in the piston, very much as shown in Van Bever. The difference between this and Van Bever is that the ring in the Vincent patent is not a lock ring but an expanding ring. This piston would function somewhat like Exhibit B except that the resiliency of the walls of the piston skirt would be either augmented or impaired by the spring ring in the bottom of the skirt. Inasmuch as this piston has no horizontal separation between the head portion and the guide portion, and inasmuch as there is no flexibility at the top of the skirt where it is really needed, the piston does not have the same construction as those of the patent, or any of the patents in suit, nor does it have the same mode of operation, nor does it give the results. I think the construction of these flexible composite designs places the other Vincent description so far outside the subject matter of the patents in suit that they perhaps need no further consideration.

Mr. Richey: My learned adversary, what is the effective date you claim for this British patent to Hives?

Mr. Bruninga: The application for the British patent was accepted April 8, 1920; six weeks after accepting, such a British patent is open for public inspection. We claim that is the date of publication, six weeks after April 8, 1920.

Mr. Richey: Six weeks would be what date,—do you claim the effective date? Well, we have a certified copy here showing the date as the 24th of June, 1920.

Mr. Bruninga: That is the sealing date. I will grant that is the sealing date. I grant that the sealing date is June 24, 1920; but I rely upon the publication date, which is six weeks after acceptance, which would make it May 20, 1920.

Mr. Richey: Well, if it becomes important, we will have to put you to proof on that date, because we understand the sealing date is the effective date.

Mr. Bruninga: You will agree it was received in the Patent Office on June 1, 1920?

Mr. Richey: We agree that our adversary produces a copy of the Hives patent, photostatic copy showing the stamp of the Library of the United States Patent Office as of June 1, 1920.

Mr. Bruninga: I claim the date of May 20, 1920, as the publication.

The Master: You don't object to it?

Mr. Bruninga: No, and I want to get the date. I understand you don't object because there are photostatic copies produced?

Mr. Richey: No, sir. No, we have a stipulation on that.

Q. Doctor, will you next take up the British patent to Rainforth 6,826 of 1912, and compare the piston illustrated and described therein in structure, mode of operation and results, with each of the pistons of the patent in suit? A. The Rainforth piston is something like Exhibit B except as shown it has more of the slots running from the bottom of the piston skirt or from nearly the bottom of the piston skirt up to approximately the level of the bottom of the boss holes. This Rainforth piston is even more impractical than the Exhibit B because the skirt is supposed to be "sprung" into the cylinder barrel. The top of the guide section must necessarily come well above the bosses, so this piston has no horizontal separation between the guide section and the head section, and hence is different in construction from the flexible skirt patents in suit. It has no relation, as I see it, to either Moorea or Schmiedeknecht. My conclusion is therefore that this piston is far worse than Exhibit B from a practical standpoint.

Q. What kind of fit is contemplated with that Rainforth piston? A. A spring fit.

Q. And just what do you mean by a spring fit? A. That the skirt of the piston would be originally prepared larger than the bore of the cylinder, and the piston would be sprung into the cylinder when the cylinder was cold.

Q. Then the piston would start with a tight fit and as it heated up what would happen? A. When it heated up it would be still tighter.

Q. If it would rub in the beginning, when it was heated up, what would happen? A. The piston could not function properly under these conditions; it would rub so tightly that there would not be enough power produced in the engine, or the piston would break due to poor mechanical strength, or it would seize.

Q. Was that piston ever used commercially, to your knowledge? A. No.

Q. Who is D. Napier & Sons, Ltd., of England? A. Well, they are, to the best of my knowledge, motor car manufacturers.

Q. They manufactured cars on quite an extensive scale, didn't they? A. Yes, they have in the past.

Q. Will you look at page 2 there and consider that the piston had been modified in the manner suggested in connection with the U-shape slots, and compare such pistons with the patents in suit? A. Apparently the U-shaped slots mentioned on page 2 of the patent are to be put in the "outer portion" of the piston, which is the skirt portion. The length of what I take to be the arms of the U, would run around the circumference of the skirt in some manner. The piston is supposed to be fitted similar to the piston with the vertical slots, indicating a spring fit. Such a piston would have no more bearing on the patents in suit than the pistons shown in Fig. 1 or 2 of the drawings.

Q. Will you state whether or not those pistons with the U-shaped slot also embody the spring fit with the resulting operations that you have already described? A. It is so indicated in the paragraph beginning line 6, page 2, that they are supposed to have the spring fit.

Q. Now, will you turn to the Spillman patent 1,325,176, and compare that in structure, mode of operation and results, with the pistons shown in each of the Jardine and Maynard patents? A. This Spillman piston has a head section and a guide section, the head section apparently being separated in part from the guide section by horizontal slots, and then the guide section is made flexible by means of two spiral slots extending from the bottom of the piston skirt almost half way around the piston, each spiral slot connecting with one of the ends of each horizontal slot. The Spillman piston is therefore a very flexible piston, in fact, it is so flexible that it is no good. The explosion forces on the head of the piston are transmitted to the thrust face in such a manner as to collapse the skirt metal in the so-called flexible tongues. For example, in Fig. 1 of the drawing of the patent, one of the so-called tongues may be indicated as the portion bounded by the horizontal slot and the spiral shown in solid outline. The end of the tongue would therefore be the intersection between the horizontal slot and the spiral slot. The end of the tongue

is so flexible that the entire wall pressure must be taken adjacent the end of the tongue by the remainder of the skirt. This produces an excessive stress on the large end of the other tongue, which may be regarded as bounded by the spiral slot, shown in solid lines, and the bottom of the skirt itself. The high stress on the large end of this tongue produces deformation and collapse which moves the small end of the same tongue inwardly from the cylinder wall permanently so that it does not bear on the cylinder wall. The result of this construction is that the piston skirt is not strong enough to stand the usage in a motor. Collapse of the solid portions obtains and the piston becomes unsatisfactory. The reason for this result is partly in the nature of the slotting, which is different from that shown in the Jardine and in the Maynard patents in suit. In the Jardine patent, for example, the thrust forces are resisted by the webs so that the skirt does not have the opportunity to collapse because it is not so highly stressed as in the Spillman construction. The fact that these slots in Spillman are put on both sides of the piston, makes the piston still worse than if the slots were put merely on one side. In the Maynard construction the horizontal separation and the vertical slot opposite that of maximum thrust, together with the web construction, gives the guide section not only flexibility but an ample strength to resist the collapse as a result of the thrust forces on the piston. The Spillman piston therefore does not have the same construction as Jardine or Maynard and it does not have the same mode of operation nor it does not give the same result. Its mode of operation insofar as the decrease in diameter of the skirt as a result of wall pressure, may be regarded as somewhat similar, but the manner in which the skirt is slotted in Spillman guarantees against successful operation, whereas the slotting, in combination with other features in Jardine and Maynard, is favorable to success.

The Master: We will recess until 9:30 Monday morning.

(Thereupon, at 9:30 A.M., Monday, March 20, 1933, the hearing was resumed.)

Mr. Richey: Defendants' counsel has asked us, in order to facilitate his policy with respect to the pistons of the Schoengarth patent, to announce our

views at this time with respect to the claims in suit of the Gulick patent, which we think, as we are at present advised, describe the 1911 piston that Mr. Gulick used in his 1911 tests, and the 1914 piston that Mr. Gulick used in his 1914 tests. Accordingly, in order to accommodate opposing counsel, we make the following provisional announcement:

The 1911 Gulick piston, claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 42 and 43; the 1914 Gulick piston, claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 38, 42 and 43.

With the consent of defendants' counsel I correct the following error which we made in the announcement of claims of the Gulick patent infringed.

We announced we were charging that claim 34 was infringed by Exhibit 3-O. This announcement should have been that we charged infringement of this claim by Exhibit 3-J. As corrected, the charge is that Exhibit 3-J infringed claim 34. We do not charge that Exhibit 3-O infringes claim 34.

Mr. Bruninga: As I understand, by the 1911 piston you mean the piston represented by Exhibit 48?

Mr. Richey: No, the one that he testified it was. Exhibit 48, as I understand it, doesn't exactly conform to what he testified it was.

Mr. Bruninga: What I had in mind, that motorcycle piston which had the circumferential ribs on it.

Mr. Richey: Well, what we had in mind in arriving at these claims was the piston that he tested in the Renault car.

Mr. Bruninga: That is all right. Now, as to the 1914 piston, it is the one represented by Exhibit 51.

Mr. Richey: It is the aluminum piston.

Mr. Bruninga: The aluminum piston represented by Exhibit 51 which was tested in the Amplex car?

Mr. Richey: I think Exhibit 51 conforms exactly to his testimony, I am not certain.

Mr. Bruninga: Now, I notice that there are a number of these claims applying to the 1911 and 1914 pistons, and my recollection is not clear whether any of those are relied upon as being infringed. I mean, were all of them being relied upon as being infringed by one or more of the exhibits?

Mr. Richey: Well, we only announced the claims in suit.

Mr. Bruninga: Now you made a statement it was for the purpose of enabling me to take a position with reference to Schoengarth. I want it understood that is not the only purpose. The purpose was to make you state your position before it was determined whether I was to take any further evidence.

Mr. Richey: Well, that is the only purpose for which you asked that we state it, and the only purpose for which we have stated it.

Mr. Bruninga: Well, the record will show that. I don't want to commit myself.

Mr. Richey: As I said the other day, and as the Master well knows, the claims are interpreted in the light of the prior art, and it is not fair to ask us to interpret them and pass upon the prior art, but we are willing to accommodate you, and we have. Are you ready to go ahead?

Mr. Bruninga: Yes.

FURTHER DIRECT EXAMINATION OF MR. JEFFRIES
by Mr. Richey.

Q. Doctor, do you know whether or not any efforts were made to commercialize the piston shown in the Spillman patent 1,325,176, and if so, you may state what you know about it and what the results of such an effort were, that you know was made? A. Yes, the Kant Skore Company in Cincinnati tried to commercialize the Spillman piston and the results were very poor.

Q. What happened to the piston when it was used in commerce, if you know? A. The pistons collapsed so in the slotted or tongue portions that they became useless or unsatisfactory in operation; also there was hard rubbing on parts of the piston bearing surfaces nearest the bosses and very little bearing pressure at the thrust faces.

Q. State whether or not the use of these pistons was discontinued commercially, if you know? A. Yes, so far as I know no piston like this is being manufactured today, nor has such been for a good many years.

Q. Was any piston substituted for it by the Kant Skore Company, and if so, what piston? A. Yes, the split skirt type of piston as characterized by the Maynard patent was generally substituted for the Spillman piston by the Kant Skore Company.

Q. Will you next take up the patent to Long, 1,395,441, and compare the piston illustrated and described therein with the piston of the Jardine and Maynard patents in suit? A. This Long piston in patent 1,395,441, is a single-walled piston with special slotting on each of the thrust faces of the skirt or guide section of the piston. On one side is a T-slot, as shown in Fig. 2, and on the other side is a complicated slotting consisting of a U, or more accurately, a rectangular shape with one side of the rectangle missing, and a vertical slot extending from the bottom of the slot to approximately the line between the two bosses, as shown in Fig. 1. From the drawings it would appear that the slot is entirely in the guide section and therefore the horizontal slots do not separate the guide section from the head section. If that is a fact the slotting can do no good because the piston would seize in the guide section just above the horizontal slot where the piston would be the hottest. Furthermore, there is no relief around the boss section, and with no relief the piston could not conform to the cylinder wall at the top of the skirt, even by utilizing distortion, because the piston would exert pressure against the entire circumference. The Long piston, therefore, does not have the guide section separated from the head section by a horizontal slot, as in Jardine, nor is there relief around the bosses in combination with the slotting, as is found in Jardine. This piston, therefore, does not have the same construction as Jardine and it does not have the same mode of operation as Jardine, and it therefore cannot give the same results as Jardine. The analysis with respect to Jardine is also applicable to Maynard. The Long piston does not have the same construction as Maynard, nor the same mode of operation, nor can it give the same results.

Q. Will you answer the same question with respect to the Long piston shown and described in the Long patent, 1,489,499? A. This piston is a double-walled piston, as shown clearly in Fig. 5, which is a cross section through the bosses. It has a complicated set of slots, shown in Figs. 1, 2 and 3. The slotting on one of the thrust faces, as shown in Fig. 1, is rectangular, with one of the sides of the rectangle missing. It may be described also as one horizontal slot with two vertical slots extending one from each end of the horizontal slot to the bottom of the skirt. This is the side which is double-walled, as is shown in both Fig. 4 and Fig. 5. The other thrust face is slotted with one horizontal slot and two

vertical slots, which connect the ends of the horizontal slot but do not go down to the bottom of the piston skirt. This piston does show a horizontal separation between the guide section and the head section. This separation is clearly shown at numbers 11 in Figs. 1, 2 and 3. There is, however, no boss relief in combination with the slotting. The piston in my opinion would have a certain degree of wall or skirt flexibility in operation. As compared with Jardine the construction is different, as can be clearly seen. Jardine has in one of its constructions a double wall at the head of the piston but in neither of his constructions does it have a double-walled skirt section. In one of the Jardine constructions there is no double wall in any portion of the piston. So from the standpoint of a double-walled skirt section, the Jardine construction is different from that of Long. Jardine has a simple system of slotting, as opposed to Long's complicated system of slotting, and Jardine uses boss relief in combination with horizontal and vertical slotting, which is not found in Long. The mode of operation of Jardine is therefore different from the mode of operation of Long, and the result is also different.

The Long construction is not like the Maynard construction. In the first place Maynard shows nothing but a single-walled structure. The Long construction does not have the combination of flexible webs and horizontal and vertical slotting with relief, as shown in the Maynard patent. The mode of operation of Maynard therefore is different from the mode of operation of Long, and the result is also different.

Q. You are asked the same with respect to the Long patent 1,872,772? A. This construction is a complicated one, having double-walled sections around each of the bosses of the skirt section. The piston, when completed, has two horizontal slots and six vertical slots, each of the six vertical slots connecting the horizontal slot with the bottom of the piston. The horizontal slot does also in this patent separate the head section from the guide section, as is shown by the numbers 12 in Figs. 1, 2 and 3. The drawings show no relief around the bosses, so that there appears to be no combination of horizontal and vertical slotting with boss relief in this patent. The construction is clearly different from that of Jardine, both in the double-walled nature of the skirt and in the system of slotting and the absence of boss relief. The mode of operation of the Long construction is quite com-

plicated but no doubt a certain amount of flexibility is gained in the skirt section as a result of the web construction and the series of slots. The mode of operation, however, is different from that of Jardine and the result is also different. This is true also of Maynard. The construction is clearly different from that of Maynard and the mode of operation is different and the result is also different.

Q. Now, would you supplement your last answer by including the same comparison of Exhibits E and F with the Jardine and Maynard patents? A. Exhibits E and F appear to be similar to each other, with the exception of the ribbing inside the piston head. This ribbing would appear to make little difference in the general construction, mode of operation or results of the Exhibits E and F, so I can, for the sake of brevity, compare piston Exhibit F with the Jardine and the Maynard constructions.

Exhibit F is a double structure with the six vertical slots and two horizontal slots, as described in the Long patent just previously discussed. The horizontal slots appear to separate the head section from the guide section. There is also relief around the bosses in Exhibit F which was not described in the Long patent itself. This relief around the bosses would, in my opinion, make the piston function better than without such relief and would bring the mode of operation of this Exhibit F nearer to that of Jardine. The mode of operation, however, would still be different because of the double-walled nature of the skirt and the complicated system of webs and slotting. The result, insofar as functioning, would somewhat simulate that of Jardine, but the piston would be much more expensive to manufacture and it would be heavier and would therefore not give the complete results of the Jardine construction. This particular piston head shows that the side opposite from the one bearing the exhibit tag, has collapsed in service. The gases have been blowing clear by the piston, as shown by the excessive carbon deposits at the bottom of the skirt under that boss. There has also been some collapse apparently in one of the thrust face sections, as shown by the carbon accumulation on it. There has also been fairly hard rubbing on one or the other thrust faces just opposite the end of one of the cross webs. So that, apparently, this particular piston did not function properly in service. As compared with the Maynard construction, the

same analysis holds. The construction is different from Maynard and the mode of operation, even though the relief is present in Exhibit F around the bosses, is different from that of Maynard, and the result is different. One of the differences between Exhibit F and Maynard is in the nature of the bottom of the skirt. The bottom of the skirt in Exhibit F has six openings in it as compared with one in Maynard. It can be seen by examining Exhibit F that the carbon deposit is found in each one of the six vertical slots. So that the result obtained with Exhibit F is inferior to that obtained with Maynard.

Q. There is some testimony in this record to the effect that Long pistons were used by the Franklin Company commercially. State, if you know, who made the castings that were employed in the manufacture of these Franklin pistons? A. I don't know who made all of the castings, but I know the Aluminum Company of America made castings for the Franklin Company over a considerable period of time.

Q. Do you know when that period began? A. Well, I don't know, not from the standpoint of making a record of it, but I think it was some time along 1920 or thereabouts to about 1926.

Q. One of those pistons bears the name of Levett, Exhibit E? A. Yes, Exhibit E does.

Q. And who was Levett? A. Levett was a manufacturer of pistons and other aluminum castings.

Q. Is that the Levett that was referred to as formerly a licensee under the patents in suit? A. Yes.

Q. This piston also bears the following notation: "Pat. 3-4-19." That is the date of the main process patents which you were asked about formerly in this case, isn't it? A. Yes.

Q. Are you familiar with any of the activities of the Aluminum Company of America in its work in connection with this Franklin piston made after these Long designs? A. I don't know that I understand quite what you mean.

Q. (Question read by reporter.) A. Well, I am familiar with quite a number of things that happened.

Q. Just state in a general way what those activities were. A. Well, the Aluminum Company didn't like to manufacture this piston, for one thing, because it is a difficult piston to manufacture in a permanent mold, but various other designs were submitted to Franklin and some time along about 1926 they adopted the Invar Strut

piston, which became standard at that time and is standard with Franklin at the present time.

Q. Will you next take up the British patent to Hives 140,968, and compare it in structure, mode of operation and result with the piston shown in the Maynard patent in suit? Will you look at the original copy of this patent instead of using a photostatic copy. A. The Hives piston is the trunk type piston divided into a head section and a skirt or guide section. The division between the head section and the skirt section being at one of the grooves containing some oil holes, the oil holes being designated as "d^2"; the groove itself is designated "d^1." The fact that the oil groove "d^1" separates the head section from the guide section is clearly evident by placing dividers across the head section and then noting that the same setting of the dividers does not encompass the diameter of the skirt section. Therefore the T-slot, which is found in the Hives construction, is entirely in the guide section. The horizontal separation is far enough below the separation between the guide part and the head part to prevent the flexing of the piston in the flexible portion from functioning properly or satisfactorily in a motor. If the piston were given the proper clearance for the top of the skirt, the T-slot would have no opportunity to do any good by flexing. There is a suggestion that one part of the skirt may be ground oval. This is included in the paragraph beginning line 32, of page 1; there are two slotting constructions suggested, one being a T-slot and the other an H-slot, and if the T-slot is used the part to be ground oval would be from the horizontal slot A downward to the bottom of the skirt. If the H-slot is to be used, the oval grinding would be between the two horizontal slots, in accordance with the paragraph to which I have referred. The drawing in cross section, as shown in Fig. 2, indicates by measurement with dividers that the skirt is somewhat oval on the section given. The larger diameter, however, is across the bosses, where it certainly could do no good in this particular piston. I think it would make very little difference where the oval had its greatest diameter, however, because the piston would not function properly as a flexible skirt unit anyway, as compared with Maynard. In the first place, the main construction is different in that the Hives piston is the regular trunk type piston with no relief around the bosses. The Maynard piston consists of the head section with webs relieving

the skirt in the boss section, and a full diameter skirt at the bottom, the head section and guide sections being divided into two parts by the horizontal slots, and the skirt portion being flexible by joining the horizontal slots with the bottom of the piston in one of the thrust faces. The Hives piston showing no horizontal separation at the division between the guide section and the head section, is, therefore, entirely different in construction from the Maynard construction. The Hives construction has a different mode of operation from that of Maynard and it could not give the same result as Maynard.

Q. You said that the long axis of the oval ellipse was along the bosses in the Hives patent. Upon what do you base that statement? A. On measurements made with dividers on the drawing in the certified copy of the Hives patent.

Q. And who made those measurements? A. I made the measurements.

Q. Would you take this copy that has been offered in evidence and measure that also? A. (Witness complies) The same is true of the copy which has been offered in evidence.

Q. Will you now look at Defendants' Exhibit 3-Q, which is said to be a Franquist piston, modeled after the piston shown in the Franquist patent 1,153,902, which you discussed in your prima facie testimony. The defendants' expert suggested certain changes in this piston which are as follows: (Record 737) "The walls of this piston and the slots may be made thinner, the length of the slots could be increased, which would increase the lever arm and make the slots more flexible. • • • Q. And what would happen if you cut all the way through a slot on one side of the wrist pin, one on either side? A. That would make that side of the skirt adjacent to this cut very flexible." As I understand it there are three proposed changes. Will you take up the Franquist patent, as modified in each of these ways, and compare it in structure, mode of operation and results, with the patents in suit? You may use any sections of the Franquist piston which you have cut out, in answering the question.

Mr. Bruninga: I don't want to make any objection to this witness again going into the Franquist patent and models which were fully discussed on prima facie, but I simply want to reserve my right to offer surrebuttal evidence later on.

Mr. Richey: The facts are these: he asked him about the Franquist patent in prima facie cross examination. I objected to it as improper. And then we went into it and defendants' expert came along and proposed to modify the Franquist piston in three different ways. Now, I have asked the witness to compare the piston thus modified.

The Master: I think I understand the situation. I will pass on that question when it arises.

(Short recess taken.)

Mr. Bruninga: I also want to make an objection that the plaintiff in this case is estopped to deny the operativeness and utility of the structure of the Franquist patent 1,153,902, and is estopped to deny that it covers and even discloses the subject matter of the main piston involved here, which is Plaintiffs' Exhibit 1. I want to at this time hand the Court the printed record in 6264, the *Cleveland Trust Company and Chrysler Corporation, appellants, vs. the Simmons Manufacturing Company,* which is now pending in the Circuit Court of Appeals for the Sixth Circuit. I stated before I was going to get a copy of this and substitute it for one of the papers in this case.

The Master: Is this my copy now?

Mr. Bruninga: That is your copy, your Honor.

Mr. Richey: Are you offering this in evidence or marking it in evidence?

Mr. Bruninga: Yes, I will find out later on. I will mark it for identification later, just as soon as I can get the list of exhibits because I want to substitute it for one of the papers in the file that I offered in evidence.

Mr. Richey: The sections which the witness has produced I mark for identification 71-A and 71-B.

A. Taking the first suggestion of Mr. Stellman to make the walls of the piston thinner and the walls of the ribs thinner to gain flexibility, it is my opinion that if the walls are made thin enough to produce useful flexibility, the mechanical strength of the piston would not be great enough to withstand the stresses imposed during service. The second suggestion that the ribs be extended in length, that is, axially, toward the vertical axis of the piston, would to my mind also be ineffective in producing flexibility because the extension of these ribs towards the axis would continue to add an element of

rigidity which would defeat the desired results. There is, furthermore, a physical limit on the extension of the ribs axially because of the needed room inside the piston skirt for the connecting rod connection, and operation. Such a construction would also add to the difficulty of making such a piston, to its weight and to its cost. I do not believe, however, that the added flexibility would result even if the ribs were extended axially. The third suggestion that the slot be extended completely through one of the ribs on each side of the piston, would not produce the desired result, in my opinion. There would be in that case one diameter of the piston which would be rigid and hard rubbing and eventually seizure would occur across this rigid diameter. Immediately adjacent the completed slot one of the skirt surfaces, that is the skirt surface on one side of the slot, would be quite flexible, and the skirt surface on the other side of the slot would be rigid. None of these changes, to my mind, would therefore make the piston, as modified, the same construction as that of any of the patents in suit, and the mode of operation would be different and the result would be different.

I have here two parts of a piston of the Franquist type, which piston was given to me by Mr. McCoy. In order to get an idea of the flexibility of the skirt portion as a result of the slotted ribs described by Franquist, I had the head portion separated from the skirt portion. The head portion is marked 71-A, and the skirt portion is marked 71-B. The skirt in this piston would appear to be somewhat thinner and the rib walls thinner than in Defendants' Exhibit 3-Q. The head, when it is attached to the skirt, has a very powerful tendency to keep the skirt from flexing. To obtain the flexibility of the skirt itself it is therefore necessary to separate the skirt from the head. It can be readily seen that even the skirt itself of the Franquist construction is very rigid, simulating the stiffness of a trunk type piston.

Mr. Richey: I offer the two piston parts referred to by the witness and which were marked for identification Plaintiffs' Exhibits 71-A and 71-B in evidence by those numbers.

The Master: If there is no objection they may be received.

Mr. Bruninga: With the same reservation and the same objection.

The Master: With the same reservation.

Q. Have you a section of the Maynard type of piston similar to 71-B, by which you can show the differences in the operation between the two? A. (Witness produces same.)

Mr. Richey: I ask that these two parts be marked for identification 72-A and 72-B.

Mr. Bruninga: With the same reservation and the same exception.

The Master: They may be received with the same reservation.

A. I have here a Maynard type piston which has been cut into two parts, the separation in this case being made in the skirt section proper, immediately below the horizontal slot. The great flexibility of the skirt section itself can readily be seen or determined by hand flexing.

Mr. Richey: I offer in evidence Plaintiffs' Exhibit 72-A and 72-B the parts so marked for identification and referred to by the witness in the last preceding answer.

Mr. Bruninga: Same reservation and same objection.

Q. Will you next take up the Ebbs patent 700,309, and compare the piston illustrated and described therein in structure, mode of operation and result, with the pistons of the patents in suit? You might supplement your answer by making the same comparison with the piston which is illustrated in Defendants' Exhibit 4-B. A. In the first place this Ebbs piston is a composite piston; it is very complicated in construction. The complicated construction, according to the patent, is resorted to for the purpose of making the skirt part replaceable rather than discarding the whole of the piston. In order to make the skirt part replaceable it is divided into two halves, "f". The putting on of these two halves makes a horizontal separation between the head section and the skirt section, and the halves are necessarily divided in such a manner as to make in the skirt, when assembled, two vertical separations which appear in construction to be slots. In that broad sense the piston has a horizontal separation and a vertical separation. The horizontal separation, however, has no function, at least, in flexing, nor do the vertical separations have any function whatsoever in producing flexibility. The skirt of this piston must be arranged in such a manner as to provide full clearance when the piston is in operation. This is pro-

vided beyond any doubt by the construction itself. There is a cross-bridge construction inside the skirt of the piston which holds the connecting rod. There can be no possible reduction of diameter by flexing or distortion across the thrust faces. The vertical slots in this piston are therefore not in the thrust faces. These vertical slots are perpendicular to the thrust faces. The region at the ends of the structure holding the connecting rod will be hottest in the piston described. Heat will be conducted from the piston head through the rod "d" to the connecting rod support. From there it will be conducted to the skirt so that the hottest part of the skirt would be at the ends of the connecting rod support. There is no relief shown in the region of the thrust faces or in any manner which would make it possible to operate the piston at less than the normal full clearance to operate a completely solid piston. The wall sections are such that even if flexibility could be utilized to compensate for extra expansion, the structure would be quite rigid. The Ebbs construction, therefore, in addition to being very complicated, is one in which the mode of operation is essentially that of a solid, rigid, non-flexible type piston. There is no mention in the patent that the skirt is supposed to be flexed, and there is no mention that the skirt can be fitted closer than with a conventional type of piston. This Ebbs construction, therefore, adds nothing to the flexible skirt type of piston. Its construction is wholly different from that of any of the patents in suit; its mode of operation is that of a solid and rigid skirt piston, and its result is that of the solid or rigid type of piston and not that of the flexible skirt patents in suit.

Considering the so-called modification of the Ebbs patent as shown in Fig. 4-B, the modification is apparently made in order to bring the vertical separation of the two skirt halves into the thrust faces instead of at right angles to the centers of the thrust faces. If the construction in Exhibit 4-B is made, there would be some possibility of the vertical slots functioning, if they could do any good, and if the sections were made proper for flexibility; but there is no justification in the Ebbs patent for placing the vertical separation in the thrust faces, and, furthermore, there is no possibility that such a construction, even as modified in Exhibit 4-B, could function as a flexible skirt piston. Again, the rigid cross member supporting the bosses would be non-deformable, and there is no boss relief shown, so the full clearance of the skirt must be provided in the boss diameter of the

figure 4-B. Even after such a piston were constructed, it would be of no use whatsoever. No one would think of constructing a piston like is shown in 4-B for commercial operation in these days; the expense would be unbearable and the composite nature would be unsatisfactory, and the functioning of the piston would be at least no better than that of the trunk type piston. The whole Ebbs disclosure, it seems to me, has no bearing on any of the patents in suit.

Mr. Bruninga: I want to object to this witness' answer on the following grounds: here, again, plaintiff is estopped to take the position that the Ebbs patent does not disclose anything of the patents in suit, or that it has no flexibility, or that the vertical slot has no function at all. The law examiner's decision in the interference in which the Gulick patent was involved distinctly established that there was no invention in a splitting of the Spillman & Mooers patent structure in view of the Ebbs patent. Now, there was no appeal taken from that decision; the claims were deliberately cancelled by the owner of the patent.

Mr. Richey: Not the claims in the patent, of course.

Mr. Bruninga: The claims rejected by the law examiner were deliberately cancelled, so that establishes a condition of estoppel, and this witness is now taking the position just contrary to the position of the Patent Office, which was not appealed from at all. I just want to make my objection at this time.

The Master: Objection will be noted.

Mr. Richey: Of course we challenge all that.

Q. Will you next take up the Chenard & Walcher patent 468,595, and compare that in structure, mode of operation and results with each of the patents in suit? You can use the translation that has been offered in evidence with the Chenard & Walcher patent. A. This Chenard & Walcher patent refers to a piston with a horizontal separation only between the head section and the guide section. It is stated in the patent that it had been the practice previously to grind the cylinders in a special way to accommodate the method of expansion of the piston. This was done on a special copying lathe and was not a simple machine shop operation. It is also stated that by this invention it is made possible to machine the skirt of the piston in the ordinary lathe. That

means that the machine ground and need not be bothered with the technique of the special shapes obtainable with the copying lathe. The means for producing this is a specially designed piston with connectors running directly from the flat of the head to the bosses, so that the skirt can be entirely separated from the head portion horizontally. In this way it was hoped that the heat would pass from the head directly down to the boss region and by-pass the top of the skirt section, thereby keeping the skirt cooler than would obtain with a piston having the head section attached to the skirt section at its periphery. There is not any evidence in the patent specifications nor in the drawings that a flexible skirt was contemplated. In fact, everything is in the direction of having a non-flexible skirt which is supposed to operate better because it is kept cooler. The piston shows no relief of the skirt section around the bosses or any place else. In other words, the skirt is supposed to be cylindrically finished. This piston being a non-flexible type piston has a different construction from Gulick, Jardine and Maynard, a different mode of operation, and gives different results. It does not embody the Mooers principle because there is no relief in combination with the horizontal slotting. It does not embody the Schmiedeknecht invention because the nature of holding the bosses, and the bottom skirt regions, is different from the Schmiedeknecht construction.

Q. Would you make the same comparison between the piston disclosed in the Chenard & Walcher patent and this Ray Day piston of Plaintiffs' Exhibit 81 A. The general construction of the Chenard & Walcher piston is quite similar to that of the Ray Day piston, with the exception, of course, of the vertical slot in one of the thrust faces of the Ray Day piston. This vertical slot not only changes the construction but it changes the mode of operation and results of the piston. There are, however, some other differences. Chenard & Walcher apparently desired a rigid piston. Their construction is rigid. The rib or ribs across the head, is in the direction of rigidity. It is not clear from the drawing how many ribs there would be across the head, but in any event the rib or ribs would militate against the flexibility of those webs. Furthermore, the construction of the web section, according to one of the paragraphs in the patent, could be annular in the Chenard & Walcher; in this case the construction would be quite different from that of the Gulick piston, Plaintiffs' Exhibit 8.

There is also a horizontal rib at the bosses in the Chenard & Walcher construction, as shown in Fig. 2, the extent of which is uncertain from the drawing, and I think quite unobtainable from the drawing. At least, I see no possible way of arriving at the vertical thickness of the rib shown around the bosses in Fig. 2 of the Chenard & Walcher patent.

Mr. Richey: Marked X on the Chenard & Walcher patent in evidence.

The Witness: In the Ray Day piston, Exhibit 8, there is also generous boss relief which is not found in the Chenard & Walcher patent or drawing. So that the Ray Day piston, Exhibit 8, has a different construction, different mode of operation, and gives a different result from the Chenard & Walcher construction.

Q. Will you next take up the patent to White 1,495,936, and compare that with each of the patents in suit in the same way? A. This patent appears to deal with a very specially constructed piston, in which the wrist pin of the connecting rod shifts during the stroke. The design apparently was made so that the shifting wrist pin take most of the load and a centrally designed wrist pin takes none of the strain due to the shifting of the position of the rod. I cannot see where this patent has any bearing on the patents in suit at all; a very complicated piston-wrist pin arrangement; I never heard of its being used any place. I don't see any arrangement for flexing the skirt or anything of that sort. I don't see where the patent has any bearing at all on the patents in suit.

Q. Will you next answer the same question with respect to the piston illustrated and described in the Anderson patent 1,283,021, making that comparison with respect to Gulick, Jardine and Maynard only? A. This Anderson piston is what might be described as a skeleton type of piston, or slipper type of piston, in which the slipper surfaces are not separated from the head section, that is, the piston has no horizontal slotting and has no vertical slots. It is, therefore, not a flexible piston and has different construction and a different mode of operation, and gives a different result from either Gulick, Jardine or Maynard.

Q. Now, will you next take up the French patents to Serex, 434,147 and 16,362, and compare the disclosures therein with each of the disclosures of the patents in

suit? A. Considering both of these Serex French patents together, the part I believe that was stressed by Mr. Stellman was the valve piston, and particularly the horizontal and vertical slotting in such valve piston, as shown in Figs. 1 of both of the patents. In the first place, these valve pistons are not pistons for internal combustion motors in the sense that the patents in suit are. The pistons do not have a head section separated from a skirt section by a horizontal slot. The pistons are relatively light, not requiring the strength of a piston which must impart the explosion force to the operating mechanism of a vehicle. The slotting in this case is made in place of the rings, apparently. There appear to be no other rings to seal the wall between the piston and the cylinder. In the patent 16,362, Fig. 1, it is clear that even the horizontal separation comes below the boss, there is only a small portion of this piston slotted two ways to make it serve as a spring ring in the valve piston. There is no combination of horizontal and vertical slotting and relief. The main body of the piston is apparently fitted to run fairly snugly in the cylinder. These patents do not represent the construction of the flexible skirt patents in suit; they don't operate like the flexible skirt patents in suit; and they don't give the results of the flexible skirt patents in suit.

Q. Will you next take up the British patent to Fairy 12,772, of 1914, and make a comparison with the disclosures in the Gulick and Schmiedeknecht patents? A. The Fairy construction is apparently that of a composite piston, where the head and skirt portions are made in one piece, and the boss connection is made in another piece and riveted or otherwise attached to the skirt of the piston. There is no horizontal separation or vertical separation, so the piston does not have a flexible skirt. It has no bearing, as I see it, therefore, on the Gulick patent in suit. Insofar as the Schmiedeknecht patent is concerned, the Schmiedeknecht patent is an integral structure, as opposed to a composite structure. In that sense the two structures are different, and the boss section seems to be entirely supported on the riveted-in webs in the Fairy patent, whereas the boss in Schmiedeknecht is supported in part by the web and in part by the skirt near the head section in the Schmiedeknecht construction. The Fairy patent, as I see it, therefore, has no bearing on the Schmiedeknecht patent.

Q. Will you next look at Figs. 3 and 4 of the British patent to Pugh, 17,256, and the descriptive matter refer-

ring thereto, and compare the disclosure thereof with the pistons disclosed in the Gulick and Schmiedeknecht patents in structure, mode of operation and results? A. This is a built-up piston, almost of tin can construction. The Pugh piston in my opinion would not function satisfactorily in a motor anyway on account of the thinness of the various sections, and because there would be no adequate bearing in the head portion. The piston is also a double-walled one, in the head section, and to an extent around the bosses. The Pugh construction is therefore different from the Schmiedeknecht construction and it would also operate differently and give a different result.

Q. I now hand you a piston which I have marked for identification Plaintiffs' Exhibit 73. State what that is, if you know. A. I believe that is one of the Ricardo type pistons which was discussed in my prima facie examination relating to the tests on Ricardo type pistons in the laboratories of the Aluminum Company of America.

Mr. Bruninga: I don't want to object to this. I think it was brought up on prima facie, but I again want to make a reservation that I may want to ask for surrebuttal testimony on this.

The Master: Same ruling on that.

Mr. Richey: Of course his position is this: he discussed these Ricardo pistons with his experts and now we are answering him.

Mr. Bruninga: Yes, but I asked particularly about the production of some of these pistons on prima facie and they weren't produced.

Mr. Richey: I offer that in evidence as Plaintiffs' Exhibit 73.

Q. Is that like any of the pistons shown in this Defendants' 3-S? A. It is approximately like Fig. 2 in Defendants' Exhibit 3-S, with the exception that Fig. 2 has some ribbing in the head which is not found in Exhibit 73.

(Thereupon, adjournment was taken to 1:30 P.M.)

(At 1:30 P. M., same day, Monday, March 20, the hearing was resumed.)

Q. I next call your attention to the Venner piston illustrated in Defendants' Exhibits J and K, and ask you

to compare that in structure, mode of operation and results with the pistons shown in the Jardine and Maynard patents in suit? A. The drawing in Defendants' Exhibit K is somewhat different from that shown in Defendants' Exhibit J, especially in the web construction, but the differences appear to be of minor importance. I can, therefore, discuss Exhibit J as representative of both exhibits. This piston is double-walled in both the head section and the skirt section. There is a partial horizontal separation between the head section and the guide section. The piston has no relief around the bosses or on the skirt section, so in that respect the construction is different from both Jardine and Maynard. As I view the Venner construction, there would be little if any flexibility across the thrust faces. The side walls of the skirt would have some flexibility, especially at the bottom, but the rib construction is such as to militate against even the flexibility of the side sections of the skirt. Insofar as the Venner piston is double-walled in both the head portion and the skirt portion, it differs decidedly in construction from both Jardine and Maynard. The combination of horizontal and vertical slots, properly placed in a guide section, with relief, as found in both Jardine and Maynard, is absent in Venner. The mode of operation of the Venner construction is therefore different from both Jardine and Maynard, and the results would be different.

Q. In your discussion of the Monckmeier piston you gave some dimensions in reference to those pistons. Have you produced drawings showing those dimensions? A. Yes, I have two drawings, one showing the dimensions superimposed on the Monckmeier cast iron piston, and the other the dimensions superimposed on the Monckmeier aluminum piston, Defendants' Exhibit 3-W.

Mr. Bichey: The drawing showing dimensions on Defendants' Exhibit 3-V is offered in evidence as Plaintiffs' Exhibit 74, and the drawing showing dimensions on Exhibit 3-W, is offered in evidence as Plaintiffs' Exhibit 75.

Q. At page 840 of the record, Mr. Stellman, defendants' expert, testified as follows: "Yes, I should say that not every feature in each patent in suit was covered by any one patent which I might have picked out." Do you agree with that statement or not? A. I agree with it,

Q. Mr. Stellman produced a vector diagram, Defendants' Exhibit 4-A, and discussed the same in connection with the operation of the piston like Exhibit 1. Will you take that diagram and state whether or not you agree with Mr. Stellman, and if not, state your reasons? A. Defendants' Exhibit 4-A is a drawing showing a cross section of Plaintiffs' Exhibit 1 type of piston, just below the horizontal separation between the head portion and the guide portion. As I understood Mr. Stellman's testimony, the effect of the various forces on the piston at point A, Defendants' Exhibit 4-A, would be such that this point would have no flexibility. In order to ascertain the facts, I had a piston similar to Plaintiffs' Exhibit 1 cut in two on the section represented in Defendants' Exhibit 4-A. When the piston is separated in two parts in that manner, it is clearly seen that the whole of the skirt section becomes very much more flexible in the detached state than it is when attached to the head of the piston. From rather rough measurements which I made with the help of some bathroom scales, it indicates that the flexibility of the bottom of the skirt of a piston like Exhibit 1 is only one fifteenth as great with the skirt attached to the head in the manner of attachment in Fig. 1 as when the skirt is detached from the head as shown in Exhibits 72-A and 72-B, particularly 72-B. In other words, it takes 15 times as much pressure applied on the bottom of the skirt to close the slot in Exhibit 1 as it does in the detached skirt Exhibit 72-B. This shows the tremendous effect of one part of a piston on other parts, especially in these flexible type pistons. In the head portion containing a small part of the skirt section, in Exhibit 72-A, the flexibility of the skirt portion can then be readily demonstrated by pressure of the two thumbs on the slotted portion. This shows beyond any question that the skirt portion, even though it is attached to the head portion, has flexibility resulting from the combination of vertical and horizontal slotting. I found it possible in a piston which was supposed to be similar to Plaintiffs' Exhibit 1 to flex the webs at point A in Defendants' Exhibit 4-A merely by applying pressure on the bottom of the skirt with one hand. I have a micrometer on Plaintiffs' Exhibit 1 now across the two points corresponding to A. The diameter across the two points is 2.6085", approximately. If someone will turn the micrometer screw while I press on the bottom of the skirt. (This is done.) The reading at the present position appears to be 2.6085.

I will now press on the bottom of the skirt, merely with one hand. The reading on the micrometer as it was turned up while I was pressing is 2.595. That is a considerably greater deflection than I was able to effect on the other piston so I think it would be well for me to check it. I will make a new measurement across the point A without flexing. The measurement I obtain now is 2.6070. Now if some one will turn the micrometer wheel, while I—(This is done.) After I flexed the bottom of the skirt with one hand, the reading is 2.595". That is still considerably more flexibility than I was able to obtain on the other piston. I am afraid in screwing this up, you may have taken hold of the smooth part of the handle. (The one who assisted the witness): I did in both cases.

The Witness: Well, I only took the knurled part of the handle. The smooth part is attached rigidly to the micrometer, and the knurled part is attached movably to the micrometer; that is the difference. Now, the diameter in the unsprung state is 2.5985. So, if someone will turn the ratchet now, taking hold of the knurled part only (ratchet turned by Mr. Richey). Now the reading, after turning the micrometer up in the sprung position is 2.592. That is more in line with the amount that I was able to spring the other piston supposed to be similar to Plaintiffs' Exhibit 1.

There is another way of demonstrating the movement of the webs at the point A in Defendants' Exhibit 4-A. I just fastened the micrometer across the point A in Exhibit 4-A and screwed it tight enough so that its own pressure against the walls of the web would hold the weight of the micrometer by gravity. Then by taking hold of the bottom of the piston and springing it with one hand, the micrometer dropped off of the piston. Both the measurements and the tests just described demonstrate clearly that in Exhibit 1 itself there is measurable flexibility of the webs at point A in Defendants' Exhibit 4-A.

In this connection I should like to mention also the horizontal slot in Plaintiffs' Exhibit 1 is not put in in quite the same way as the horizontal slot in the Maynard patent drawing. The horizontal slot in Plaintiffs' Exhibit 1 is put in by a groove tool so that the web is cut on the bias or at an angle. In the Maynard patent drawing the horizontal slot is cut more nearly straight through the webs. As shown in the Maynard Fig. 1, for example,

the web flexibility would probably be more than in Plaintiffs' Exhibit 1, varying, however, merely in degree. The turning in of the webs at their outer ends in Plaintiffs' Exhibit 1 makes them more flexible in the thrust direction than the webs shown in the Maynard patent. So the flexibility of the webs at the top of the skirt in the Maynard patent, in my opinion, would be very appreciable and certainly enough to function in a helpful way in the operation of the piston. The amount of flexibility found by micrometer measurement just now is considerable from the standpoint of piston clearance, which is measured in thousandths of an inch and some times in ten-thousandths of an inch.

Mr. Bruninga: I want to make the same reservation with reference to Exhibit 1 as to its flexibility, as already made to some of the questions. This matter was also discussed on the prima facie proof and most of this witness' answer is simply an accumulation or new argument to what he said before rather than a plain rebuttal of this Exhibit 4-A.

The Master: The same ruling on that. We will pass on that.

Mr. Richey: Pass on that when we come to it.

Q. Doctor, have pistons of the Maynard type without this relief shown at A been used commercially, and if so, in what quantity?

Mr. Bruninga: That, your Honor, was fully covered on prima facie. If you have some new angle on it—

The Master: Let him answer.

Mr. Richey: I can tell you what the difference is, if you want to know.

A. Yes, they have been used commercially and in large quantities, say in the hundreds of thousands.

Q. Will you compare this Exhibit 3-J in structure, mode of operation and result with the Gulick patent in suit, considering that the slit in Exhibit 3-J is cut through at both ends, in answering the question? A. This Defendants' Exhibit 3-J is, I think, a piston for the Ford V-8, 1932 model. It is quite a refined piston, both from the standpoint of its design and its final preparation for use in a motor car. It has a flexible skirt, when the vertical slot is completed, and the piston is divided into two main parts, the head part and the skirt or guide part, by a horizontal slot at the top of one of the thrust

faces. This combination of horizontal and vertical slots, the horizontal slot separating the head section from the guide section, will function the same as the combination of horizontal and vertical slotting in the Gulick construction. This piston, Exhibit 3-J however, has not only boss relief in combination with these other things, which is not found in Gulick, but the piston is also cam ground; that is, the machining of the piston in the plant before it is put into the car is quite special. The piston therefore embodies features not described in Gulick, but which depend for its successful operation on the combination of horizontal and vertical slotting, the horizontal slot separating the head section from the guide section, and thereby gaining flexibility of the skirt section, in so far as the skirt is flexible as a result of that combination, and Defendants' Exhibit 3-J has a mode of operation similar to Gulick and would obtain the same results as Gulick.

Mr. Bruninga: Same reservation as to surrebuttal.

The Master: Same ruling.

Q. Look at Defendants' Exhibit 3-O and compare that with the Gulick patented piston and the Mooers patented piston. A. Defendants' Exhibit 3-O is also a rather refined piston. It is, I believe, a piston for the Plymouth 1932, six-cylinder engine. This piston has a horizontal separation of the head section from the guide section on one thrust face. It also has a vertical slot connecting with the horizontal slot and combining with it in such a manner as to produce flexibility of the skirt section, especially at the top of the skirt where flexibility is most needed. The slot in Defendants' Exhibit 3-O does not extend to the bottom of the skirt. The skirt, however, is ground oval from the top to the bottom. The piston can be fitted so that the minimum clearance between the piston and cylinder is less than in a piston containing no slot. This is true at the top of the skirt because the combination of horizontal and vertical slotting permits some flexibility of the skirt and because the skirt is ground oval at the top, which permits of some distortion of the piston to compensate for excessive expansion, and also because the vertical slot is not completed, the portion of the top of the skirt immediately above the bosses becomes hotter than the portion adjacent the horizontal slot, and as a result of that the Mooers principle is brought into play to help change the piston from an oval shape to a round shape without exerting

pressure against the wall of a cylinder. That is the Mooers force tending to distort the piston is a force inside the piston itself, as a result of horizontal slotting and relief and differences in temperature between one part and another part of the piston. The Mooers principle would also apply at the bottom of the skirt to an extent as well. So that there is a force inside the piston itself tending to change the oval shape to a round shape without exerting extra pressure against the cylinder wall. Those are the reasons that I gave for saying that this piston is a rather refined piston. It is simple in its wall structure and rather complicated in its final finishing, in so far as the relations between horizontal and vertical slots and oval grinding are concerned. In so far as the top of the skirt is made flexible by this combination, this piston has the mode of operation at the top of the skirt of Gulick. In so far as the Mooers principle tends to change the oval shape to a circular shape, it has the mode of operation of Mooers. So that I should say the piston, although it embodies additional features over Gulick and over Mooers, it also embodies the Gulick features and the Mooers features.

Mr. Bruninga: Same reservation, your Honor.

The Master: Same ruling.

Mr. Richey: Direct examination closed.

Cross Examination by Mr. Bruninga.

Q. Is it your idea that the question whether a test is made for experimental purposes or for something going beyond experimental purposes, is a matter of the intention of the party who makes the test? A. Well, I wouldn't say that would be true entirely, at any rate. It might have some bearing on it. I don't know as there is an accurate definition of what is an experimental test and what is a test for further purposes. What one person would regard as still experimental, another one might regard as beyond the experimental stage.

Q. That is really an arbitrary matter, isn't it? A. To quite an extent it is.

Q. You also state that the length and duration of the test depended upon the change that has been made in the structure? A. Yes, that is one factor that has to be taken into consideration.

Q. In other words, if no substantial change has been made between one test and another, you would still consider that the first test has not been completed and

should be made over again in order to test out the particular structure? A. Well, I don't know exactly what you mean. Perhaps you can give me an example of what you mean.

Q. Well, if you take a piston having a certain construction and a test has been made for a certain period, and then a second test is made on another piston which don't differ in structure or mode of operation at all from the first one, would you still consider the second test an experimental test? A. Oh, it might be, yes. I would like to see the differences which you have in mind between the two structures.

Q. Well, in structures such like pistons that are changes in design and in thickness of material and strength of certain parts, or putting a web here, or putting another web there, those changes are made continually by motor manufacturers, aren't they? A. Well, that is pretty general. Some times a change which appears considerable can be put in without really changing much of anything; and another time a change which appears to be minor is the difference between success and failure.

Q. There is a difference in pure design and the development of a new construction that is generally recognized in the engineering art, isn't it? A. That is a change of an old design?

Q. There is a difference between a design of, say a piston having a certain construction or a certain diameter, or for another diameter, and a development of the new structure? A. Some times there is, although change in diameter is a very important change in certain applications to pistons.

Q. Well, take the Oakland piston, that is a small piston? A. Yes.

Q. And the Ford piston was a larger piston? A. Yes.

Q. Do you know which came first in the structure of the character of Exhibit 1? A. Yes, the piston more like the Ford piston; that is the Maxwell piston, which is more like the Ford, four-cylinder engine piston.

Q. Let's take Exhibit 1, the construction which you said simulated the Maynard patent; can you give me two pistons of different diameters that were used in cars around between 1922 and 1926? A. Yes, I think so. The Oakland as one and Maxwell another.

Q. They were of the same construction as far as simulating the Maynard patent was concerned, were they

not? A. Yes, generally, although the Oakland had the line F in Fig. 2 of Maynard vertical instead of at an angle as shown in the Maynard drawing; and the Maxwell piston, I think, had the line F pretty much as shown in Fig. 2 of the Maynard drawing.

Q. And the Oakland was the smaller diameter of the two? A. Yes.

Q. The Maxwell came out first? A. Yes; before the Oakland, as I recall it.

Q. Now, when the Oakland piston was designed, that is, put on the drawing-board, it was naturally necessary to change the dimensions all around? A. Yes.

Q. Even thickness of materials? A. Yes.

Q. And the piston was carefully tested by Oakland, was it not? A. Yes.

Q. The tests running over a considerable period? A. I don't know how long.

Q. But you rather believe that the piston was run over a considerable period? A. Yes.

Q. Now, what was the purpose of that test? A. To prove in the piston.

Q. Well, to prove whether or not the parts were dimensioned properly; isn't that right? A. Well, only in part. It was to prove whether the piston met all of the requirements demanded of a piston.

Q. But partly it was, at least for the Oakland engineers, to determine whether the design, that is, dimensioning of the parts, was correct in order to stand, have the piston stand up in the engine? A. Yes; not only to stand up, but to function without slapping or without sticking and without undue oil pumping.

Q. And that was an experimental test also, wasn't it? A. Oh, I think so, yes.

Q. What I am driving at, many experimental tests are carried out on pistons of the same construction but of different sizes? A. Yes, that is true.

Q. And one of those tests is to determine whether sufficient or too much clearance has been given to the piston? A. Yes.

Q. In other words, the clearance is not the same for all diameters? A. No, it is not.

Q. It doesn't even vary in the same proportion, does it? A. Not directly, no.

Q. Then the dimensioning of any piston requires its dimensioning and construction to be followed up by tests? A. Practically so, yes; it has been so in the piston art.

Q. And that included both block tests, that is where the engine is stationary, and road tests? A. That is correct.

Q. As a matter of fact, some of these road tests on engines containing a new piston, are performed for other purposes than to simply test out the piston? A. Some times a number of things will be under test at the same time.

Q. The road test is really to find out whether the car as a whole runs good? A. Some times.

Q. Well, after a trip, what do you do? A. The testing pretty generally in pistons may be divided into two main parts, I should say: the supplier of the piston may make up his mind that a piston of such and such design will be satisfactory. He may be thoroughly satisfied with it, but the motor car manufacturer is never satisfied with any test that the supplier may make; he makes his own tests and satisfies himself that the part is satisfactory. So in that sense, the road test made by the motor car manufacturer is usually made to prove in these various things to satisfy the motor manufacturer that the part is satisfactory for the standard equipment in his car.

Q. And after a long road test, the car is brought back into the shop and various parts of it carefully examined? A. That is correct.

Q. And even if there is a new piston put in the car, that examination is not limited to the examination of the piston? A. No, not as a rule.

Q. Do you know how pistons for stationary engines are tested? A. Well, yes.

Q. They are given a stationary test? A. Yes, they are.

Q. They don't take that stationary engine and mount it on a truck and run it all over the country, do they? A. No.

Q. You continually referred to pistons for pleasure cars. Do you find anything in these patents that specifically restricts the subject-matter to pistons for pleasure cars? A. No.

Q. The patents are for pistons, aren't they? A. Yes.

Q. And they might be for pistons for tractors? A. Yes, sir.

Q. For trucks? A. Yes.

Q. For stationary engines? A. Yes.

Q. Even for air compressors? A. Yes, they might be, but some of those are pistons for internal combustion

engines; of course those couldn't be usable in air compressors.

Q. Well, they can be used in air compressors, can't they? A. They might be; I don't know; but the problem that is met in the air compressor is different than the one that is met in the internal combustion engine.

Q. Well, assuming that to be true, what we have before the court here is a piston, haven't we? A. Yes, pretty generally.

Q. Now, going back to 1914 when the test of the Gulick aluminum piston was said to have been made, at that time permanent mold castings had not come into use? A. Permanent mold castings for pistons?

Q. Permanent mold casting of aluminum pistons? A. No.

Q. And any aluminum pistons in use at that time were sand cast pistons, were they not? A. Supposed to be.

Q. Well, you are pretty sure that they were sand cast pistons? A. Yes, I am.

Q. Now, a man might be satisfied with something less exacting in a sand cast aluminum piston than in a permanent mold aluminum piston; isn't that right? A. He probably would have to be if he were satisfied at all.

Q. In other words, a piston that showed up well after say a certain number of thousand miles, alumium piston in 1914, might be considered satisfactory, while in 1920 it might not be considered satisfactory? A. That is possible.

Q. You would expect more of an aluminum piston after 1915, wouldn't you? A. Yes.

Q. That is after permanent mold practice came into use? A. Yes.

Q. You heard Mr. Gulick testify, didn't you? A. The latter part of his testimony, yes.

Q. Well, in your opinion a sand cast piston that stood up for 4500 miles was a very good piston, was it not? A. Well, I think that depends a good deal on the conditions of testing, the conditions of running. If the piston had little or nothing wrong with it after that test, I should say it was doing very well.

Q. You don't think that piston was too brittle, do you, being sand cast? A. I don't know anything about it.

Q. Well, from your experience in permanent mold casting, would you expect a sand cast piston, a split sand cast piston of the structure described in this Gulick, as

Exhibit 51, to stand up for 4500 miles? A. Well, it depends entirely on the casting, the construction, the clearance allowed, and how well the piston was lubricated during operation, how hard it was run—there are a lot of factors that have to be taken into consideration.

Q. Well, you were familiar with all the factors, that he ran as much as 60 miles per hour; that he had a clearance so small that he actually pushed the pistons into the cylinders, in your opinion did that piston stand up for 4500 miles, being a sand cast piston? A. Well, I know nothing about it.

Q. Well, I know, but as an engineer what is your opinion?

Mr. Richey: I don't think his opinion is any good. We have had fast testimony on it, and he is asking his opinion to a fact. I object to it as incompetent.

The Master: This is in cross examination. I think he may answer.

A. I think that if the piston had been well made and well designed and well fitted, that those are the results that should have been expected.

Q. In the Kant Skore, in the Sterling and in the United cases, you testified that it was practically essential to employ permanent mold castings where you had a split piston on account of the vibration of the walls of a split piston as it went up and down in the cylinder. You testified to that effect, didn't you? A. Yes. I didn't have 4500 miles or 5,000 miles life in mind, however; I had 30,000, 50,000 miles life in mind. Nor did I have merely six pistons in mind. These pistons are used by the millions, and the desire is that each one shall stand up.

Q. It is your present opinion, then, that the sand cast piston constructed like Exhibit 51 and split like Exhibit 51 and ribbed like Exhibit 51, and separated from the head like Exhibit 51, actually functioned in that engine? A. Well, now, you are asking me for a conclusion as to facts, which of course I am not in position to give. If you ask me a conclusion as to whether that could do so, I will say yes, it could.

Q. But you didn't hesitate at all to give your conclusion as to Monckmeier's piston, did you? A. No, I didn't. I have the Monckmeier piston before me.

Q. Well, Mr. Gulick described his piston pretty accurately, didn't he? A. Yes. I testified nothing as to

facts, however, as regards the Monckmeier piston, that is, as to what Monckmeier did or what he did not do. I had no way of knowing those things.

Q. But you guess pretty well of what he didn't do? A. Yes, I analyzed, from the structures before us, as to what he must have done or what he must not have done in certain respects.

Q. But do you want to say whether in your opinion the Gulick piston probably worked for 4500 miles in 1914? A. Yes, I do.

Q. You say you really think it did? A. Well, I can't say as to whether I think it did or not because I think that is asking for a question of fact over which I have no way of knowing. I will say, however, that in my opinion Mr. Gulick's description of the piston and his results are entirely in accord with what might have been expected.

Q. And you don't think that piston was too soft, then, to operate satisfactorily? A. I think it very likely may have been too soft to operate satisfactorily, especially as regards battering out of the ring grooves, which is usually the first thing to happen to a sand cast aluminum alloy piston, and even that does not usually come inside of 5,000 miles. I have run sand cast aluminum alloy pistons myself more than 10,000 miles.

Q. You didn't tell the Court in those other cases that, did you? A. No, I didn't. I would have, however, if I had been asked. I told the Court about the battering out of these rings in the sand cast piston, and of course that is a fact they do, and if the Gulick 1914 piston had been run long enough that difficulty probably would have shown up.

Q. But that was a matter of metal, wasn't it? A. That was a matter of metal to a large extent, yes.

Q. In other words, 5,000 miles, which is 500 more than Gulick figured out he ran, and those defects would have shown up? A. No, not necessarily, but there was no evidence as to whether the ring grooves had battered out or whether they hadn't, as I understand the evidence on the Gulick 1914 piston.

Q. Well, you think Gulick would have said that the ring grooves had battered out, if they had actually battered out, wouldn't you? A. He might not even have noticed it.

Q. Even after careful examination? A. Yes, that is true.

Q. You don't think the piston was too brittle? A. I don't know anything about it.

Q. Well, being a sand cast piston and being before the age of permanent molding, which according to your previous testimony in the other case, put the aluminum piston on the map, what have you to say?

Mr. Richey: I object to that, interpreting the witness' testimony without confronting him with it.

Mr. Bruninga: He is at liberty to say whether he testified like that.

The Master: He may answer. If he wants to get what he said before, let him get it and see, but I think it is proper cross examination.

A. (After question is read) It may well have been too brittle for long life, or if not too brittle it may have been too soft for long life.

Q. Being a sand cast piston, it would naturally show up some scoring on account of inclusion of sand? A. Oh, no.

Q. You don't think so? A. No.

Q. That didn't happen in the sand cast piston? A. No, the sand that sticks to the surfaces is all machined away.

Q. It is not in the cavities, in any possible cavities in the aluminum piston? A. No, anything of that sort would show up on the machining of the piston.

Q. You have stated on direct examination you have read Mr. Gulick's testimony, particularly about the tests that he made? A. No, I didn't say that I read his testimony, as I recall it. I heard him describe his tests. I read none of Mr. Gulick's testimony.

Q. You heard all of his testimony as to the tests that he made? A. Well, I don't know whether that was all of his testimony regarding the tests or not. I heard him give testimony regarding his tests. To be more exact, I did not hear any of Mr. Gulick's testimony prior to the 14th of March, and I think I heard all of his testimony from the 14th of March until its conclusion.

Q. Now, going to the Schoengarth piston, that piston really had a T-slot in the skirt? A. Not in the ordinary sense that we speak of a T-slot.

Q. How much inclination do you have to give the vertical stroke in order not to be a T-slot? A. I don't know as I could state what inclination the vertical slot should be given, but the lower end of the T in Schoengarth is directly below the center of the boss, and the

location of a slot in that position is such as to make the thrust face at the bottom of the skirt very flexible, that is, the whole of the thrust becomes available to close the slot; whereas if the lower end of the slot is in one of the thrust faces instead of at right angles to the center of the two thrust faces, the explosion force, or the other thrust force, is not so potent in causing collapse or closing of the slot itself.

Q. You see a wide distinction between the T-slot of the Schoengarth patent and Exhibit 48, leaving out of consideration for a minute the adjustments of the Schoengarth patent? A. I don't know whether to call it a "wide" or not, but there is a very marked difference. In the Exhibit 48 the vertical slot begins not in the center of the thrust face at the top of the skirt but off to one side from the center of the thrust face, and then goes diagonally toward the bottom of the skirt and intersects the bottom of the skirt at some distance from a line drawn between the center of the boss vertically to the bottom of the skirt. The Exhibit 48 slot therefore has a tendency to utilize only a portion of the thrust force to close the slot, whereas the slot of Schoengarth can utilize the entire thrust force to close the slot.

Q. You think Exhibit 1 is more like Exhibit 48, or more like the Schoengarth patent, disregarding for a moment the adjustment, considering only the slotting? A. In one sense it is more like Exhibit 1, because the center of the vertical slot in Exhibit 48 is in the center of the thrust face, and the center of the vertical slot in Exhibit 1 is in the center of the thrust face; whereas in Schoengarth the center of the vertical slot is way over to one side of the center of the thrust face. On the other hand, the angularity of Exhibit 48 slot is more like the Schoengarth slot than it is the Exhibit 1 slot.

Q. But Schoengarth's vertically extending slot starts from about the center of the horizontal slot, as in Exhibit 1, while in Exhibit 48 it starts, the vertical slot, starts from nearer one end of the horizontal slot? A. That is correct.

Q. In that respect Exhibit 1 is more like the Schoengarth patent? A. With respect to the top of the vertical slot, that is true.

Q. Well, leaving out the adjustments of the Schoengarth patent, the skirt will contract and expand, will it not? A. The bottom of the skirt will, if the sections of the metal of the piston are made proper, but the top

of the skirt, that is the portion of the guide section above the horizontal slot, will not.

Q. You mean the part above the slot 3 in Fig. 2? A. That is correct.

Q. That of course will not expand? A. That is not flexible, no.

Q. That is not flexible. And that part in Exhibit 48 is also not flexible, is it? A. No, it is not.

Q. According to Mr. Gulick it is just made smaller in diameter? A. Yes, or according to Mr. Gulick that horizontal slot in Exhibit 48 or in, rather, pistons of which 48 would be considered to be a rough example, the horizontal slot divided the head section from the guide section.

Q. You don't actually find that in Exhibit 48, do you? A. I haven't measured it.

Q. Well, you can measure it right now and settle it. A. (After witness measures same.) No.

Q. What did you find the diameter of the part above the slot, the horizontal slot, along the line of the wrist pin bosses, to be? A. 4.121" approximately.

Q. And the same diameter at right angles to it? A. Yes, approximately.

Q. What is the diameter of the top ring land? A. 4.118", approximately.

Q. In other words, that piston don't represent accurately what Mr. Gulick said the 1914 piston construction was? A. 1914?

Q. 1911. A. No, it does not.

Q. That happens in patent drawings, too, doesn't it, that patent drawings don't show the actual dimensions? A. Very often they do not.

Q. Well, most of the time they don't? A. Oh, most of the time they do not show actual dimensions, no.

Q. And even when an ellipse or an oval is supposed to be shown on the drawing, having a very slight difference between the major and minor axis, the draftsman usually takes a compass and draws a circle, doesn't he? A. I think he is apt to, yes.

Q. Now, going back to a comparison of the Schoengarth patent and Exhibit 48, the bottom of the skirt is very, very flexible, is it not, of Exhibit 48? A. Yes, it is.

Q. And that is one of the faults you found with the Schoengarth patent construction, leaving out the adjustments? A. Oh, I don't find that particularly as a fault with the Schoengarth patent, leaving out the locking

rings, I merely call attention to it as having no useful function.

Q. But you do find that a fault with the Kant Skore piston, Exhibit 3-Z, didn't you? A. Yes, that is a fault in the Spillman type piston.

Q. Do you know why Mr. Schoengarth in his patent carried the slot 4 around so far, that is, can you tell from the patent itself, or do you remember whether the patent states why he did? A. I don't remember.

Q. Well, I want to read to you a sentence from the patent, page 1, lines 53, *et seq.*: "This slot is cut diagonally for two purposes, first, to prevent scarring, and, second, for convenience in making the upper and lower piston adjustments." The first purpose of preventing a scar, that is common with practically every piston, to incline the slot, for instance as in Exhibit 1? A. That is the usual practice, yes.

Q. In other words, if you have it vertical, why, people believe that there will be a groove worn in the cylinder? A. That is the reason, I think, for the making of the slot slightly diagonal.

Q. Now, the second reason, for convenience in making the upper and lower piston adjustments, can you tell me what would have happened if Mr. Schoengarth had located his adjustments right down below the middle of the horizontal slot, that is, in one of the thrust faces? A. Yes, I think so. I think the adjusting means would have interfered with the connecting rod in the stroke.

Q. But of course if he shifted it around, the lower adjustment particularly, if he shifted it around, it would not interfere with the connecting rod? A. That is correct.

Q. At the top he could leave it in the center, couldn't he? A. Yes.

Q. Mr. Schoengarth used somewhat inwardly projecting adjusting parts which required him to shift the lower adjustments around at right angles from where he could have put it if the connecting rod had not been there? A. That is true. The location even at the top of the skirt is placed in the thrust face so that the locking and adjusting means will not interfere with the bosses. So that everything in the Schoengarth construction is designed to be used with those locking means.

Q. Well, he uses those locking means and he inclines his vertically extending slot to the limit in order to locate his lower adjustment? A. That is correct, and also the upper adjustment.

Q. Well, so far as the upper adjustment is concerned, the vertical slot can start from the middle of the horizontal slot? A. Yes, or it could start from the bosses; it could start from any place. The location of it in the thrust face is merely incidental, as I see it, to the freedom from interference with the bosses themselves.

Q. Well, the required freedom of interference with the connecting rod required the slot to be on that long slant? A. Yes, that is the only reason that the vertical slot is placed as it is, and consequently the horizontal slot is placed as it is, as I see it.

Q. You have said that the piston was more rigid than a non-slotted piston. Did you mean by that that the structure itself with the slot in it and with the two screws in it, would be more rigid than if there would be no slotting of the piston at all? A. I think so, yes, more rigid against distorting to an out-of-round shape, for example, to accommodate itself to a cylinder that might be slightly oval.

Q. Well, that is what the adjustment was for, wasn't it, to adjust it to a cylinder that was oval? A. No, I think the adjustment was to merely take up the extensive clearance that had resulted from wear.

Q. Where did the wear take place in an engine cylinder—all around? A. Well, yes, it takes place to some extent, but by far the greater part of it is usually on the thrust faces.

Q. And that adjustment would take up for that wear? A. I don't know, I suppose it would.

Q. The piston itself, without the slotting or without the adjustment as shown in the Schoengarth patent, is the Ford piston of that day, isn't it? A. I don't know.

Q. You are not familiar with it? A. No.

Q. One of your objections to the Schoengarth patent was that there was no relief in the region of the wrist pin boss. That is a serious objection in your opinion, is it? A. Well, I mentioned that as one of the features of the construction as shown. There is not any relief shown around the bosses, and, particularly, no relief to work in combination with the slotting, as in the patents in suit.

Q. Now, Doctor, you have read a good many piston patents? A. Yes.

Q. You would be almost safe in saying you have read almost all the piston patents, haven't you, that issued in this country? A. No, no, not nearly all. I un-

derstand there are over 2,000 of them, and I don't suppose I have read more than 75 or 100.

Q. Do you remember whether each one of the piston patents that you have read has specifically stated that the piston should be relieved in the region of the wrist pin bosses? A. Well, if the relief is to function in combination with something else in the piston of an unusual nature, it certainly should be mentioned and described.

Q. Will you please answer my question after you have given your reasons for why it should be? A. I think your question is so general that it is practically impossible to give it a proper answer.

Q. Will the reporter please read the question to the witness? A. (After reporter reads question to witness) I am sure that each one has not.

Q. It is universal also to reduce the diameter of the piston where the ring lands are? A. Yes, it is.

Q. That has been the practice as long as you can remember, isn't that right? A. Not necessarily the whole of the ring lands, but the head of the piston in some place is separated from the skirt by head clearance, and that has been the practice as long as I know anything about it. Of course that does not follow that that extra clearance is necessarily given around each one of the rings.

Q. But it has been the practice for as long as you remember to make the head of smaller diameter than the skirt? A. Yes.

Q. And in the patents that you have read that proposition has not been repeated each time, has it? A. No, I think not always.

Q. Well, if it was repeated it shows the patent solicitor didn't know the state of the art? A. No, it wouldn't indicate that at all. In some of these constructions it becomes quite important just where this head relief and where the guide section begins, and I think it is important to note that in places where that separation has more than the ordinary significance.

Q. Well, it is so important that no piston has been made for the last 20 years in which the head wasn't larger than the skirt? A. You mean the head smaller than the skirt?

Q. The head smaller than the skirt? A. Not that I know of.

Q. Now, you wouldn't expect a patent to repeat a universally well known feature of a piston, would you? A. If it is important I would.

Q. But otherwise not? A. If it has no bearing on the patent, I don't see any reason for repeating it.

Q. Well, if you read a description of a piston and nothing was said about the head being smaller than the skirt, wouldn't you read it right into that patent? A. Oh, I think I would, if it is an ordinary piston.

Q. What would happen in a piston like the Schoengarth patent if the diameter of the part above the slot 3 was of larger diameter than the cylinder? A. Was of larger diameter than the cylinder?

Q. Yes. A. Well, if it were larger than the cylinder you couldn't get the piston in.

Q. And what would you do if you had such a piston? A. Oh, I would fix it so I could get the piston in the cylinder, certainly.

Q. And you would turn it down, wouldn't you? A. I would know that the fit was wrong and I would try to fit it properly.

Q. And you would allow clearance at that point, wouldn't you? A. Yes, I would allow clearance but how much clearance I don't know at the moment.

Q. Well, you would be safe in allowing head clearance, wouldn't you? A. Yes.

Q. And that is the only thing to do in a construction like Schoengarth, is to apply the head clearance to the lower ring land, that is the part below the lowest ring groove? A. No, that is not the ring land, that is part of the skirt in Schoengarth.

Q. All right, now, I say the part below the lowest ring groove? A. No, that is not the only thing to do, at least it wasn't back in 1915 and '16 at the time of Schoengarth. The natural thing to do was to make the whole skirt section the same diameter unless otherwise stated, and the division between the head and the skirt of that piston would certainly not be lower than the bottom ring groove; it might be higher but it certainly would not be lower.

Q. You would think, then, that any engineer that read the Schoengarth patent would deliberately fail to leave clearance sufficient to prevent seizing of the part below the lowest ring groove and above the slot 3? A. No, he would provide clearance of the whole skirt sufficient to prevent seizing, including the slotted portion and the portion above the slot.

Q. Even if he wanted to expand it? A. He wouldn't expand it until he got enough wear to take up. In fitting that piston, as I see it, it would be fitted

just like a trunk type piston at the outset. Then, later, after the skirt had been worn, this adjustment would be applied and the whole of that skirt would start out with the same clearance.

Q. And when you got through adjusting that piston you would have a piston structure in which the skirt is of larger diameter than the part above the slot 3, isn't that right? A. Not necessarily. It wouldn't do any good to be of larger diameter.

Q. Even if you would expand it? A. Well, if the piston were fitted right in the first place, you would have just as much wear on the portion below the slot as you would above the slot, or approximately the same amount.

Q. But please answer this question now: assuming that piston to be of uniform diameter from the bottom of the skirt to the lowest ring groove, and you would then expand that skirt, you would then have the skirt at right angles to the wrist pin bosses of larger diameter than the part above the slot 3? A. Yes, if you expand it with the expanders, then it becomes larger in that other part.

Q. Or if you spring it, that would happen? A. If it is sprung outward, yes.

Q. And you can spring cast iron for a few thousandths of an inch, can't you? A. Oh, you can't spring it there without the help of the slots; you couldn't spring the part just below the part 3 without also springing the part just above part 3.

Q. If you had the slots in it you couldn't spring the skirt out? A. No, I say without the slots you couldn't do that.

Q. With the slots? A. With the slots, the part below 3 could be sprung out a little farther than the part above 3; but there would be no flexible skirt structure under those conditions, the skirt would be rigid.

Q. Doctor, it was the general practice when you started to go into this piston business, learned the piston business, to have the diameter of the skirt below the lowest ring groove smaller than the skirt itself, wasn't it? A. No.

Q. I am referring to the Howe patent. I call your attention to Howe patent 968,569. You know, don't you, that automobile manufacturers paid royalties on that patent? A. No, I know nothing about it.

Q. You don't know anything then about the practice then of using that Howe construction in pistons way back as early as 1915 or '16 or '17? A. No.

Q. You weren't familiar with that? A. No.

Q. That is the feature that is shown in the Maynard patent, isn't it, in Fig. 2 at J, reducing the diameter of the head in that case? A. Yes, that is somewhat similar, at any rate.

Q. Well, anyone reading the Schoengarth patent as early as 1917, he would naturally read into it that that piston had to be relieved in the region of the wrist pin bosses? A. No, I think not.

Q. You mean to say it was the general practice then in '15, '16 or '17 not to relieve pistons in the region of the wrist pin bosses? A. No, I wouldn't say that, either.

Q. You don't know, do you? A. Yes; sometimes they were relieved and sometimes they weren't.

Q. What happened if they were relieved? A. They needed a little more clearance in fitting.

Q. As an alternative of clearance, relief was provided in the region of the wrist pin bosses? A. Yes, if reliefs were present that made it possible to use a little less clearance.

Q. Then you have the alternative of using a relief, for instance as in the Kaut Skore piston 3-Z, or of using an oval piston with the smallest or minor axis on the line of the wrist pin bosses? A. Well, I don't know what one might have done with that Schoengarth piston at that time.

Q. I am talking about pistons generally, I am not limiting myself to the Schoengarth. I am just using those two types of relieving the oval structure with the smaller or minor axis along the line of the wrist pin bosses, or an actual cut in or cast in relief? A. Well, one might use neither.

Q. Those were two expedients that were interchangeably used as early as 1917? A. In solid type pistons, I should say, yes.

Q. And anyone reading the Schoengarth patent in 1917, one skilled in the art, in this particular piston art, would know of the use of those two or three alternative constructions of securing relief? A. He might, yes.

Q. Why do you say he might, if he was one skilled in the art? A. Well, for all one could tell from the Schoengarth patent, this adjustment might do all the things that would be necessary for the proper operation of the piston.

Q. Well, if you found out that it didn't, would he naturally put in a relief? A. Oh, naturally a person would try to get the best result he could.

Q. You know, don't you, that anyone reading piston patents in 1916 or '17, and starting to design a piston, he would naturally put on reliefs in the region of the wrist pin bosses? A. No, I don't say that he would naturally do that.

Q. Well, unless he used a construction such as the Gulick patent structure or the Spillman & Mooers? A. Why, no, people used trunk type pistons without relief around the bosses.

Q. Were they skilled engineers? A. Yes.

Q. Well, do you consider that proper practice? A. I thought it was, supposed to be pretty fair. Packard used it in their 12-cylinder cars. They used the trunk type aluminum piston without relief around the bosses.

Q. And how long did the Packard 12-cylinder motor stay on the market? A. Oh, about three or four years, maybe longer.

Q. You have talked with the man that owned one, haven't you? A. Yes. I have ridden in them. I have ridden around the Indianapolis Speedway with Col. Vincent in one.

(Thereupon, adjournment was taken to the following day.)

(At 9:30 a. m., Tuesday, March 21, 1933, the hearing was resumed.)

Q. Dr. Jeffries, one of the distinctions that you stressed of the Mooers patent in suit over the Schoengarth patent is that the Schoengarth patent does not describe any relief in the region of the wrist pin bosses. A. That is one of the things, yes. The other is that Schoengarth does not have the horizontal separation between the head section and the guide section.

Q. Well, you don't think it makes any distinction that that Schoengarth slot only extends around a little less than 180° rather than almost all the way around, as in Mooers? A. Why, the principle would work in that way, if relief were combined with such a slot, provided the slot were properly located.

Q. Properly located. What you mean is that the part of the piston above the slot should be reduced in diameter to, oh, approximately what the head diameter on the ring land was? A. Yes, or at least have sufficient relief.

Q. Of course, when you talk about the Gulick 1911 piston and when you make your distinctions over Schoengarth and various other patents, you assume that that

piston, that 1911 piston like Exhibit 48, actually had the part above the slot reduced in diameter? A. Yes, I assume that, and I also assume that the skirt was made to flex in the motor, not merely be there to enable some one to lock the skirt into some definite position, like Schoengarth.

Q. Do you make that definite assumption because you heard or read of Gulick testifying to the effect that the 1911 piston like Exhibit 48 had the diameter reduced above the horizontal slot? A. That is correct.

Q. And if that weren't true, would your opinion be the same? A. No, if that weren't true I would say that the Gulick 1911 piston did not embody these inventions.

Q. In other words, in order for the Gulick 1911 piston to embody any of the patents in suit, it is essential that the diameter of the part above the horizontal slot approach the diameter of the ring lands which are usually of the standard clearance? A. Not necessarily that far, but the diameter should be less above the horizontal slot than it is below the horizontal slot.

Q. How much, roughly, would you say it would have to be on a 4" piston? A. Well, on a cast iron piston it probably wouldn't have to be more than a couple of thousandths of an inch less to make the slotting operable; but on an aluminum piston it should be more. I would say, functionally, that the diameter of the portion above the slot should be reduced enough so that it would not seize when the piston operated in the motor. Then it could be reduced considerably more than that without hurting the operation, and it might even help the operation some; but that is the distinction.

Q. What would you say for a 4" piston like Exhibit 48 with a clearance only as little as two thousandths of an inch—I don't mean per inch diameter now, but for that particular piston? I just want to get a general idea. A. Oh, in a cast iron piston, if that difference in diameter were two or three thousandths of an inch, that would be some help, yes, it might be sufficient.

Q. But five or six thousandths would not hurt? A. Oh, that wouldn't hurt, no.

Q. Now, in distinguishing between the Gulick 1911 piston and the Schoengarth patent piston, you stated that although the 1911 piston like Exhibit 48 had no relief in the region of the wrist pin bosses, it would work all right, to a degree, with cast iron? A. Yes, that is my opinion.

Q. That, of course, assumed that the diameter of the part above the horizontal slot provided for clearance? A. Yes.

Q. What have you to say about aluminum as to such a piston? I notice you said it would work, to a degree, with the cast iron. A. Yes, it would not provide so much help in the aluminum piston.

Q. In other words, in the aluminum piston it is necessary to relieve the outside of the skirt in the region of the wrist pin bosses? A. Either that or put the slot around the other side and make the metal connection between the head and the skirt very much less than it would be in the Gulick 1911 piston with the horizontal slot on one side only.

Q. You mean it is necessary to put a horizontal slot on each side, like in the 1914 piston? A. Yes, to get much help, to get enough help to make an aluminum piston function materially better.

Q. Do you think it made any difference whether the slots went all the way around in the 1914 piston or only stopped in the region of the wrist pin bosses? A. Yes, the slot going all the way around made a less rigid construction between the head and the skirt portion, and would make possible some distortion of the skirt in response to the cylinder wall pressure.

Q. Do you think it would have worked all right if the horizontal slot hadn't gone all the way around? A. Not so well.

Q. But you think it would work all right? A. It would have functioned to an extent, yes.

Q. The reason I am asking that is that one of the witnesses who was examined on behalf of Gulick said that in that 1914 piston the slot did not extend all the way around, but was more like Exhibit CCC in that respect. It is your opinion that the Gulick piston, even if the slot only extended part way around, worked all right? A. Well, I wouldn't say it worked all right; but it is my opinion that it would function to an extent. It would not be as good as the one in which the slot extended all the way around.

Q. Would an ordinary skilled mechanic make the diameter of the ring lands, the parts between the grooves, so near the diameter of the cylinder as to leave only, say, two-thousandths clearance? A. Between the ring grooves and the cylinder?

Q. Between the ring lands and the cylinder? A. No, I shouldn't think so.

Q. In other words, from as long as you have been connected with pistons, the operation of pistons, it has been the practice to give considerable clearance to the head part of the cylinder containing the ring lands? A. Yes, it has.

Q. And it has also been the practice to taper the skirt from the bottom of the land ring groove to the end? A. That is an unusual practice.

Q. Was it an unusual practice? A. Yes.

Q. But it was practiced? A. It was done, yes.

Q. And that made the skirt at the top smaller in diameter than the skirt at the bottom? A. Yes.

Q. There was a usual and standard taper in pistons, wasn't there? A. Nothing standard, I think, about it.

Q. But the idea was to take care of the difference in expansion as between the skirt at the bottom and as between the skirt at the top? A. That is right.

Q. In discussing the Gulick 1914 piston, Exhibit 51, I see you state that the construction was such as to permit distortion. Can you explain that? A. Yes.

Q. Is it possible for you to use Exhibit 51 to describe that? A. I showed yesterday in connection with Exhibits 72A and 72B what a tremendous restraining effect the connection between the piston head portion and the guide portion made in the rigidity or flexibility of the skirt portion. The connection, for example, on a piston like Exhibit 1, makes even the bottom of the skirt, some two inches away from the connection, fifteen times as stiff as when the connection is severed. In the ordinary trunk type piston with the connection of the head and skirt around the entire periphery of the skirt, the rigid head section resists the deformation of the skirt section, especially near the junction between the head and the skirt sections. In the Gulick 1914 piston, Exhibit 51, the head section is separated from the guide section by two horizontal slots which make the separation of the head and the skirt, say 75 or 80 per cent complete. This relieves the restraining effect of the rigid head from its effect on the distortion of the skirt. The vertical slot in Exhibit 51 permits the skirt to distort where it can, the play being taken up in the slot. Where there is no slot or no relief there is no place for play to be taken up. So that the piston would fit tightly against the cylinder at every point of the circumference. Where there is relief alone there may be some place for the relieved part to move so that such a piston may be dis-

torted somewhat in the cylinder. The slot, in effect, takes the place of the relief inasmuch as it provides room for the other parts of the cylinder to move when the distortion forces are applied. Therefore in my opinion the 51 construction provides for some distortion of the skirt at the top of the skirt.

Q. You believe a piston like that without relief in the region of the wrist pin bosses operated successfully with a snug fit? A. Well, "a snug fit" is a relative term.

Q. Oh, I understand that. It means a fit that you simply push it in rather easily? A. Well, it means one thing to one person and another thing to another person. The difference between the proper fit and the improper fit may be unmeasurable with any instrument.

Q. A snug fit isn't one you simply drop a piston in a cylinder and let it run way to the bottom? A. Well, I never saw any piston that would fit that way. I never saw a piston but what looked like a snug fit to me.

Q. And that was several thousandths clearance? A. Yes, yes.

Q. Now, you understand of course that Exhibit 51, as Mr. Gulick said he used it in 1914, did not have the relief in the region of the wrist pin bosses? A. Yes, I understand that.

Q. And I suppose that is the distinction over the Mooers patent? A. That is correct. The Mooers principle could not work in the Gulick 1914 construction. The Mooers distortion comes from forces within the piston itself, not as a result of cylinder wall pressure.

Q. And Mooers provided relief in the region of the connection, and Mr. Gulick provided the slot; is that the difference? A. No.

Q. Between 51 and the Mooers patent? A. No. I just explained it. The Mooers provides a combination of horizontal slotting between the head section and the guide section, and relief at the connection between the head section and the guide section; so that the distortion forces arise within the piston itself due to the construction and the differences in temperature. Any distortion in the Gulick 1914 piston, Exhibit 51, would have to occur as a result of cylinder wall pressure against the piston, that is, external to the piston.

Q. The Gulick piston, Exhibit 51, would work better if it had relief in the region of the wrist pin bosses? A. No doubt about it.

Q. No doubt about it at all? A. No.

Q. And that relief, the prior art shows, was the quite usual practice at that time? A. Not in combination with flexibility and not properly positioned to cause that benefit.

Q. Now, coming to the Monckmeier cast iron piston, Exhibit 3-V, that piston had plenty of wear in it? A. Yes, it had.

Q. In fact, taking the diameter just below the slot, the diameter along the line of the wrist pin bosses, is about seven thousandths greater than at right angles; isn't that right, from your figures? A. Yes.

Q. Well, that was due to wear, wasn't it? A. I think so, yes.

Q. You don't think for one minute it was turned oval like that? A. No.

Q. In fact, if it was turned on a lathe or grinder it must have been turned around; isn't that right? A. Yes, ordinarily.

Q. If that piston had twenty-thousandths clearance, then the wear on the diameter of the wrist pin axis was about two thousandths? A. Yes.

Q. Very little wear on the wrist pin axis? A. That is true.

Q. Now, you would expect wear in a racing car such as Mr. Monckmeier described, wouldn't you? A. Yes.

Q. You would expect lots of it, wouldn't you? A. I should think so.

Q. The purpose of these racers is to win the race even if they do damage their car some? A. Yes.

Q. In fact you find that wear on the head also, don't you? A. I find the wear on certain of these ring lands. There is no wear on the head.

Q. Well, I mean the ring lands on the head. They were worn? A. The ring lands, some of them were badly worn, showing that they had been bearing against the cylinder wall.

Q. Will you again take 3-V and take micrometer measurements across the top ring land at right angles to the axis of the wrist pin bosses? A. (Witness complies.) 4.457".

Q. Will you correct that on Exhibit 74? A. Yes, that was a mistake of ten thousandths of an inch.

Q. Just correct it. Cross out the figure on the exhibit and put in the other figure. A. (Witness complies.)

Q. It is your idea that the slotting never came into play in that piston? A. For any use, yes, for any good

use. Of course, if a piston were run with the slots in, the bottom of the skirt would have flexed, but it would not have done any good.

Q. But as far as the top of the skirt part below the horizontal slots, there was really no bearing on them at all, was there; that is, as distinct from the part above it, as you see it? A. Not to any appreciable extent at any rate.

Q. But, Doctor, you say later on if that piston had been in use, this connection should have been broken. How do you explain that? A. Well, I said it may have been broken. I didn't say it would have been broken.

Q. That is what you meant, it might have been broken? A. Yes.

Q. But not necessarily would have been broken? A. I wouldn't say it would. I would expect it to have been, however.

Q. It would be sufficient to have a T-slot on one side, if it did function properly; it wasn't necessary to have the T-slots on both sides function? A. Not if one of them did some good, the other one could be out of commission. But neither of these will do any good.

Q. That is your opinion? A. That is my opinion.

Q. You have never seen any Staver automobile, have you? A. No.

Q. You have never seen the Teeter engine of that date, have you? A. No.

Q. You don't know what kind of oiling system they had? A. No.

Q. You don't know the condition of the cylinders of those motors, do you? A. No.

Q. Do you think it made any difference whether there were slots on both sides or only on one side? A. Yes.

Q. You think it would have functioned better if it functioned at all, if the slots had only been on one side? A. No, I think it would function poorer with the slots on one side, and still poorer with the slots on both sides.

Q. It was the practice as early as you can remember to give so much clearance per inch diameter to a piston? A. No, not necessarily. Each car and each condition had to have the clearance varied to suit such car and such condition.

Q. It is your opinion, then, that the required clearance don't increase with the diameter of the piston? A. Yes, it does usually increase with the diameter of the piston but it does not increase necessarily the same amount per inch of diameter of the piston.

Q. Then with a 4½" piston you would need more clearance than with a 3" piston? A. Yes, if they are the same kind of a piston.

Q. In this Monchmeier piston circumferential expansion took place in that skirt, didn't it, run under very extreme conditions? A. Well, what do you mean by "circumferential expansion"?

Q. Well, the skirt expanded circumferentially, say at the bottom, as it became heated up? A. Yes, except that is all referred to in terms of the expansion of the diameter.

Q. One of your objections to the Monchmeier cast iron piston is, again, it has no relief in the region of the wrist pin bosses? A. Yes, it has no relief, in combination with the horizontal and vertical slotting, the horizontal slot separating the head section from the skirt section.

Q. That is one way that you distinguish it from the Moseley patent, isn't that right? A. Yes.

Q. And as far as the Schmidt-Hackbart patent is concerned, you did not consider the big holes in the Monchmeier piston as having anything to do with the holes in the Schmidt-Hackbart patent skirt? A. No.

Q. Now, as for the slot, on both sides or on one side, that is one distinction as between Jardine and Monchmeier, is it? A. Not in itself.

Q. Do you find any carbon deposits on the outside of the skirt of S-V? A. Yes.

Q. Where do you find them? A. All around one of the bosses.

Mr. Bishop: The one that is chipped on the side.

Q. Where else? A. In the oil groove, near the bottom of the skirt, on both thrust faces and below the chipped boss, oh, practically all the way around.

Q. And that was picked up by those grooves, wasn't it? A. I presume so.

Q. Picked up from the walls of the cylinder? A. I presume so.

Q. Do you find any carbon deposits on the faces themselves of the skirt outside of the region of the wrist pin bosses, due to any blow-by? A. It is quite difficult to say, the piston is so rusty, but I think there is evidence of carbon deposit in many parts of the skirt. For example, at the bottom of the skirt where the vertical slot has not been completed, there is a fairly large area

that looks like carbon deposit that has been cleaned off or at least an attempt has been made to clean it off.

Q. You don't find any carbon deposit in the horizontal slot opposite the one in which the vertical slot has not been completed? A. I find no carbon deposit in any of the slots. In fact, the little oil groove just below the bottom ring has carbon deposit in it in the region of the cracked, broken boss, and the carbon deposit stops abruptly where the horizontal slot begins.

Q. But in that top groove, the top groove picked up the deposit by rubbing back and forth in the cylinder and consolidated it in there? A. Well, I don't know.

Q. Well, that is a natural thing that happens in a piston of that kind? A. That is one way, yes.

Q. And with a splash system, or any system of lubrication as far as the vertical slots are concerned, there is oil splashing in those all the time, as far as the vertical and horizontal slots are concerned, there is oil splashing in those during all the time of the operation of the engine? A. There should be.

Q. Now, the aluminum piston, Exhibit 3-W, it is rather unsafe to take any measurements of that after its apparent condition of having been in a fire? A. Well, I think not. There are some measurements on it that are, I think, quite significant.

Q. Again, there has been considerable wear on that aluminum piston, hasn't there? A. Yes, I think so.

Q. The wear that has been on the thrust faces has been in the neighborhood of at least .003 of an inch? A. Yes, the measurements I have here would indicate .009 of an inch.

Q. The skirt is of the same diameter all the way through as from the measurement which you have taken? A. Yes, as nearly as I can measure it, that is on the boss axis. So much of the skirt is broken away on the other axis that no measurements can be made at or below the bosses.

Q. That is a sand cast piston, is it not, 3-W? A. Yes.

Q. You would expect it to be soft, wouldn't you? A. Well—

Q. As compared with the permanent mold cast piston? A. I would expect so, yes. I can tell in a moment. (Witness hits pistons together.) I have just knocked Exhibit 72-A, which is the head section of a permanent mold casting, against the head section of Exhibit 3-W,

and the Exhibit 3-W exhibits a considerable dent, whereas Exhibit 72 is hardly affected.

Q. As a matter of fact the skirt in that aluminum piston has a taper of .001 of an inch, hasn't it, from the top to the bottom? A. Well, according to my measurements they were the same, 4.47".

Q. I believe you gave the figure of the top of the skirt below the slot as 4.472 and at the bottom 4.473? A. Well, I took these figures from Mr. Gabriel's shorthand record yesterday and I can re-measure it.

Q. Re-measure those two. A. (Witness complies.) I find them both the same, 4.473".

Q. Mr. Monckmeier could not have obtained a die-cast piston or a permanent mold piston in 1915, could he, the early part of 1915? A. Well, I imagine he could after the very late winter of 1915.

Q. But not in the forepart of 1915? A. No, I think not.

Q. And that sand cast aluminum piston was about the best he could get, I don't mean as far as comparison of two sand cast pistons was concerned, but he couldn't have gotten anything else better in the aluminum piston in the early part of 1915? A. It would have been fairly soft, if he had the required toughness in it, yes.

Q. Has there been distortion in that piston due to heat, assuming it has been through a fire? A. I don't know.

Q. Well, you could tell from your measurements whether there is much distortion, couldn't you? A. It doesn't appear to be distorted, at least across the boss axis.

Q. Have you measured the temperatures of any pistons of any racing cars at the skirt? A. No.

Q. Do you know whether as a matter of fact they never do reach the temperature of 450 Fahrenheit? A. Oh, I should think they did. The figure I used in connection with this aluminum piston was 450 degrees above the temperature of the cylinder wall. And then I only took .025 of an inch as the clearance, and the indication here is that it would be at least .027 of an inch, and that would be on the presumption that the piston operated in the cylinder of just 4½" in diameter; so if the cylinders had been rebored the cylinders would have been larger than that. But I did say that this Defendants' Exhibit 3-W had a larger clearance than was used in the 5" trunk type Liberty Motor airplane engine.

Q. You assume it had .028 clearance? A. No, I assume it had .025 clearance.

Q. What made you take that figure? A. Why, I made a rough measurement on it before my cross examination, just to get a rough idea of the diameter, and I took .025 clearance just to be on the safe side. Even with a .025 clearance, I think the calculation gives about 470 degrees Fahrenheit above the temperature of the cylinder.

Q. Now, Mr. Gunn, you say he was familiar with these piston problems? A. Yes, he was.

Q. Did you consider his opinion good in 1920? A. Yes.

Q. He didn't deliberately make a mistake, did he? A. Well, I don't think he did.

Q. He was rather careful in making statements, wasn't he? A. I don't know that he was.

Q. Well, do you think he would have made wild statements without basing them on something? A. No, I wouldn't characterize him as being wild about statements he would make.

Q. Did you read this article on Aluminum Piston Design in Automotive Industries of January 29, 1920, which is in evidence? A. Yes.

Q. Do you remember whether you read it at that time? A. No, I don't remember whether I did or not.

Q. Well, you kept pretty close track of piston designs, didn't you, in those days? A. Well, fairly close track.

Q. Now, in referring to Fig. 8, two views on page 363 of that article, you stated that that piston was about the same as Exhibits E and F, with the exception of the boss relief. The boss relief is not illustrated in that Fig. 8? A. Yes, I made that statement, but my attention was called to the special boss construction.

Q. Oh, yes, I am not stressing that point. I got your explanation on that, I think the Master did, too, however, you can repeat it if you want to. A. No, there is no relief shown in the drawings in Fig. 8.

Q. The parts of the figure on the left, that was the cross section, seems to indicate that the wrist pin boss connects directly with the web, doesn't it? A. Appear to be, yes.

Q. Now the Fig. 10 on page 894, at the left, two figures, that is of the Franquist piston, is it not? A. I should say Fig. 9 is of the Franquist piston.

Q. That is what I mean, Fig. 9, yes. That is the Franquist patent, 1,153,902 corresponds generally to that, does it not? A. Yes.

Q. Now, there is no relief shown there, either, is there, in the region of the wrist pin bosses? A. No.

Q. In fact, in all of these pistons that Mr. Gunn illustrated do you find a single case where there is a relief shown in the region of the wrist pin bosses? A. Yes.

Q. Where? A. Oh, Fig. 5, for example, the hour-glass piston; Fig. 6, the Ricardo piston.

Q. Oh, yes, those are constructions where it stands out like a sore thumb, Dr. Jeffries, but you don't find relief shown in Fig. 1, Fig. 3, or Figs. 9, 10 or 11, nor in Figs. 7 and 8, do you? A. No, just in Figs. 2, 5 and 6, I believe.

Q. And that is because they were of the hour-glass and slipper type construction, and he couldn't help but show it? A. Not so with Fig. 2, however.

Q. Fig. 2, that shows a distinct relief in the region of the wrist pin bosses, does it not? A. Yes, it does.

Q. But there is no question about the Franquist patent disclosing relief in the region of the wrist pin bosses? A. No, the Franquist specification states that there is to be extra clearance in that region.

Q. But Mr. Gunn didn't even refer to that? A. No.

Q. In fact, he don't refer to relief as to any of these pistons, does he? A. No.

Q. As a matter of fact that would be understood by an engineer at that time, that there were reliefs? A. Oh, I think not.

Q. You think not? A. A relief, especially in combination with these other things, is something which is vital to certain of these constructions; where it is, of course it should be mentioned and described.

Q. I am not asking you to repeat that every time, Doctor. I think both myself and the Master understand your theory that these are combinations as distinguished from aggregations, and that the relief enters into every one of these constructions. You don't have to repeat it unless it is absolutely necessary. I am asking you this plain question, whether an engineer, in looking at a piston in 1920 or even as early as 1915, found it necessary to repeat every time that you must relieve this piston in the reginh of the wrist pin bosses, or it is desirable to do so? A. Well, that may be your idea, but I get the impression you were asking me to read into most any

prior art piston, one at a time, each of these elements and combinations in the patents in suit.

Q. I am just simply taking the position, Dr. Jeffries, of the Supreme Court of the United States in *Webster Loom Company vs. Higgins.*

Mr. Richey: I think the witness is entitled to explain his answer.

Mr. Bruninga: He is entitled to explain his answers, but let him give his answer and then if he wants to qualify it later on he can do it on re-direct.

Q. You said that this article represented the efforts that were made to solve the problem, and that it did not do so, and did not give the public a solution. Now, this was January 19, 1920. Was Mr. Gunn familiar with what was being done at the Aluminum Company of America by Mr. Jardine? A. I don't know whether he was or not.

Q. He was with the Packard Company at that time, wasn't he? A. I think so.

Q. And there was rather close friendly connection between the engineers of Packard and the Aluminum Company of America and of the subsidiaries around there? A. Just the usual relationship between the automotive engineers of the manufacturing companies and the automotive engineers of the parts companies.

Q. But he does mention the Long piston and the Franquist piston, and he says pistons of the Long and Franquist type are split to allow the piston to spring? A. Yes.

Q. Now, did he make a mis-statement, or is that a correct statement? What occurs on the first page of the article A. He made a statement which is probably correct, qualitatively, at any rate, but his statement was not very accurate with respect to Franquist.

Q. You think it was accurate with respect to Long? A. Oh, I think so.

Q. You were familiar with the Long piston at that time, weren't you, in January, 1920? A. I don't know whether I was or not.

Q. Well, where did you get your information as to the Franklin Company asking the Aluminum Company of America or its subsidiaries to make these Long piston castings? A. In the Aluminum Company.

Q. In the records? A. Oh, no, just I saw the pistons being made.

Q. By the Aluminum Company of America? A. Yes. Then I have seen the castings lying around at the Aluminum Company plants.

(Short recess taken.)

Q. In what plant of the Aluminum Company did you see those Long pistons? A. At the Harvard Avenue plant in Cleveland.

Q. What year? A. Oh, I don't know what year; I think it was around 1920, though.

Q. You say that none of these pistons in this article gave the solution to the problem? A. That is correct.

Q. You regard the Long piston, then, as not being any solution to any problem? A. It is not a solution to the automotive piston problem, no.

Q. Well, do you know of any split piston that was in use before Long, in actual commercial use? A. I don't know that I do.

Q. The Jardine piston never was in commercial use, was it? A. I think not.

Q. You know it wasn't in commercial use. You don't know of any car that it has ever been used in? A. No, I do not.

Q. You don't know of any car that the Gulick piston has ever been used in, do you? A. No, not a piston like the Gulick drawings.

Q. Yes, that is what I am asking about. Do you know of any car that the Mooers patent piston was ever used in as shown in the drawings? A. No, not as shown in the drawings.

Q. You don't know of any car that the Schmiedeknecht patent was used in? A. No not as shown in the drawing.

Q. And you don't know of any car that the Schmiedeknecht patent was used in? A. No, not as shown in the drawing.

Q. Then of all of these patents in suit there is only the Maynard patent structure as shown in the drawing that was ever used commercially? A. So far as I know.

Q. And that has not got the relief on the thrust face, has it?

Mr. Richey: Haven't we been over that enough?

Q. That is, relief in Exhibit 1. A. It has not got the bending in of the webs like in Exhibit 1, at the ends, no; but it has relief around the bosses in combination with the horizontal slot and the vertical slot.

Q. Yes. Doctor, you understand what I mean,—the relief on the thrust faces, which is the part between the sharp edge of the round part to where the web goes to the wrist pin boss. A. Yes, I understand what you mean; but that is essentially a bending-in of the web at the end.

Q. The Maynard patent doesn't illustrate that, does it? A. It doesn't illustrate that particular point, no.

Q. So when you said that the article represents effort made to solve the problem and that it did not give the public a solution, you counted in your statement the Long piston; is that right? A. Yes.

Q. And you know, don't you, that the Franklin automobile was the worst kind of an automobile to try out an aluminum piston in? A. Why, I know it was a pretty difficult car to put an aluminum piston in, yes.

Q. Well, it was an air-cooled engine, wasn't it? A. Yes.

Q. And that is about the worst condition that you encounter in automobile practice where you want to use an aluminum piston? A. I think that is true.

Q. And you know that that Long piston was used commercially in the Franklin automobile, don't you? A. Yes.

Mr. Richey: Not the one that was shown in the Gunn article?

The Witness: No.

Q. But like Exhibits E and F? A. Yes, those were used.

Q. And you make a distinction then, between the ones shown in the Gunn article and between the E and F? A. Yes, there is a distinction in the construction and there is a distinction also in the finish of the piston.

Q. The finish of the piston, so far as relief in the region of the wrist pin bosses? A. That is correct.

Q. You said a trunk type like shown in Fig. 1 of the Gunn article was successful? A. Yes, it was successful to the extent that it was used by the millions prior to the advent of the split skirt piston.

Q. And the construction Fig. 2 was also used, was it not, with the relief in the region of the wrist pin bosses? A. Yes; that happens to be, I think, the Liberty type piston.

The Master: You mean the Liberty airplane motor?

The Witness: Yes.

Q. Now, referring to the Van Bever patent, you stressed the point that the patent drawing showed a ring inside of that piston which would make the skirt stiff? A. Yes.

Q. But that was promptly left out of the Franklin automobile piston as shown by Exhibit B? A. Yes.

Q. And it operated to some degree anyway, didn't it? A. It gave flexibility to the bottom of the skirt, which has never been any problem as far as I know.

Mr. Richey: Pardon me, was that answered?

The Witness: I say, it has never been any problem to get flexibility to the bottom of the skirt, as far as I know.

Q. But as soon as that ring was taken out, the skirt did, at least a part of the skirt, became flexible? A. Yes, the bottom of the skirt.

Q. The function of that ring was to adjust it; isn't that right? A. Yes.

Q. And hold it rigidly in adjustment; is that right? A. That is right.

Q. And as soon as you took out that ring, it took out the function of adjustment and the rigidity of adjustment? A. That is right; you no longer had Van Bever, as I see it.

Q. You mean you don't have Van Bever any longer as specifically described in the Exhibit or as shown in the drawing? A. Yes, or in function.

Q. You don't apply that same rule to the patents in suit? A. Yes.

Q. You just look at the drawings and any deviation from them is heresy? A. Oh, I think I gave a fair representation of it; at least I tried to.

Q. Now, when you come to the Vincent patent 1,279,184, in the construction shown in Fig. 7, Vincent left out the positive adjusting feature of the Van Bever patent, didn't he? A. Yes.

Q. The spring ring inside didn't hurt it any, did it, didn't hurt the Vincent construction any? A. Well, it makes it heavier.

Q. How much heavier? A. I don't know.

Q. Very little; isn't that right? A. Some heavier, at any rate.

Q. Would you say over two per cent heavier? A. I don't know.

Q. Do you know that the Franklin Company used such rings in Exhibit B? A. I never knew it, no.

Q. But it doesn't interfere with the contraction of the skirt, I mean with the closing of the slots to compensate for expansion, does it? A. It should not.

Q. You said there was no horizontal separation in the Vincent patent construction. Don't you find horizontal separation in Figs. 1 and 2, horizontal separation between the skirt and the head? A. Yes. I mentioned the composite type of piston, the head in one piece and the skirt in another, and some connection in between of some sort.

Q. And that is not contemplated by any of the patents in suit, the possibility of a two-part piston? A. I don't know whether it is contemplated by any of the patents, but all of these constructions are integral constructions that we are dealing with here.

Q. What do you think is meant in the Moocrs patent in suit, page 2, lines 30, *et seq.*, "It will be understood that this relationship might be of a poor mechanical fit or joint which would be a poor conductor of heat as compared with the metal of the head 2 and connectors 3, so that such heat as did pass from the head 2 to the skirt 1 would do so principally by way of connectors 3 rather than from the head to the upper end of the skirt 1 directly." Do you think that contemplates an integral or two-piece construction? A. Oh, I think that contemplates an integral construction. Certainly the connectors, he says, are to be integral with the head and the skirt. I interpret that as merely emphasizing the fact that this horizontal separation is to be of poor heat conductivity.

Q. A poor mechanical fit or joint, in your opinion then, contemplates an integral construction? A. It says that "its relationship might be that of a poor mechanical fit or joint which would be a poor conductor of heat." That is the relationship between the connectors which conduct heat readily, and the horizontal separation which does not conduct the heat readily.

Q. And that is what you understand by the construction, even though the words "poor mechanical fit or joint" are used? A. I should think so. It says, "this relationship might" do that. It is not that the construction is that; it is the relationship so far as the heat conductivity is concerned.

Q. You think that in the Vincent patent, Figs. 1 and 2 the flow of heat from the head to the skirt would be the same whether the head and skirt were integral or connected by a joint? A. No.

Q. There will be retardation of the flow of heat, will there not? A. Yes.

Q. But again, Mr. Vincent doesn't specifically say that the skirt is relieved in the region of the wrist pin bosses? A. No, he doesn't, as I read it.

Q. Turning next to the Rainforth patent, your position is that it is impractical for the reason that the skirt has to be sprung into the cylinder; in other words, compressed to be sprung in? A. That is one reason, yes. That is what the patent says, it has to be sprung in; that would be impracticable.

Q. That would be impracticable? A. Yes.

Q. Why is that impracticable? A. Oh, if you have enough flexibility so that the piston skirt is sprung in, you wouldn't have enough rigidity to hold the thrust forces.

Q. When Mr. Gulick said that he actually pushed his piston into the cylinder, in his 1911 and 1914 pistons, the pistons were therefore impracticable? A. Oh, every piston has to be pushed into the cylinder.

Q. Well, don't you think that is what Mr. Rainforth meant? A. Hardly, when he said "sprung."

Q. Well, if a split piston has to be pushed into the cylinder, there is a springing to a slight amount anyway, isn't there? A. There might be in the assembly; they might use the spring somewhat in the assembly. That is not the only thing the matter with this piston, however.

Q. The main thing the matter with this piston is that he doesn't disclose all of the features of each of the patents, is that right? A. The main thing about it is that it just wouldn't be any good, as it has nothing to commend it for use.

Q. You have never used such a piston, have you? A. No.

Q. Have you ever tried one out? A. No.

Q. Do you know whether D. Napier & Sons, Ltd. have tried one out? A. No.

Q. Well, you don't know that they didn't try one out? A. No.

Q. Were you very familiar with the Napier cars of that date? A. No.

Q. How do you know, then, that it was never used by Napier? A. I didn't say that it wasn't.

Q. The only thing that you can say is that you never saw one of these pistons; is that right? A. That is correct.

Q. You don't think it was even an advance in the art in 1912? A. No.

Q. Did you have in mind when you discussed this patent that the specification disclosed on page 2, lines 7 *et seq.*, and particularly in lines 8 and 9, that these slits "may, if desired, be extended towards the outer end of the piston so as to be open at that end"? A. I had that in mind, yes.

Q. There is certainly plenty of relief around the wrist pin bosses, isn't there? A. Of a kind, yes. The bearing surface in fact is very meager on that piston.

Q. The diameter of the part below the rings is the same as of the ring lands, isn't it? A. The part below the rings?

Q. Yes, the diameter of the part below the lowermost ring is the same as the diameter of the other ring land? A. I don't know. The whole head or some part of that head portion must be the upper bearing of the piston on the thrust, in the thrust faces.

Q. You say "must be"? A. Yes.

Q. Why do you say "must be"? A. Why, because there couldn't possibly be a complete bearing below the boss; so there must be a bearing some place above the boss, and it has to be some place around those ring lands. There is not enough strength, wouldn't be in any metal of any construction, even today, without those vertical slots to hold the bearing of the piston entirely below the boss.

Q. Do you know that from experience or from theory? A. Oh, I know it from experience and from theory.

Q. Experience with this particular piston? A. No, experience with pistons.

Q. But the mere fact that the piston is sprung into the cylinder, and with the slots made wide enough, that doesn't mean that it would seize? A. No, not necessarily. The metal might be so thin that it has a lot of spring.

Q. What do you gather from the following statement in the patent, at page 2, lines 13, *et seq.*: "Again a U-shaped slit may be formed in the outer portion of the piston, the length of the U being transverse to the axis of the piston, and transverse slits may be arranged in a variety of ways to produce springy tongue-like portions which shall produce the required result in a manner similar to that in which the slits D act." A. Just a sort of

war on words, with the exception of the specific U-shaped portion that it described.

Q. When the specification says: "The transverse slit may be arranged in a variety of ways," that is where you stop? A. Yes. It is like trying to reach somebody by telephone when you don't know his number, and starting with the dial.

Q. You have no imagination to figure out in your own mind that the fellow meant anything else but a U-slot with its axis transverse to the piston; that is all you could gather? A. Nobody else ever seemed to gather anything.

Q. I am asking you what you gather? A. I would be just probably like the other people, only not as good as a lot of these inventors that worked on this problem. It seemed to teach nobody anything.

Q. That is all you personally gather out of it, that the U was only transverse and made exactly to a level of the piston? A. What difference does that make?

Q. I am asking you. Then you can ask me some questions. (Question read by reporter.) A. No, I would even give it considerably more leeway; still he wouldn't have anything.

Q. Now, taking up the Spillman patent 1,325,176, your statement about that piston was that it was just no good? A. Yes, that is right.

Q. You know it has been manufactured by the Kant Skore Company of Cincinnati? A. Yes.

Q. For a good many years? A. I don't know how long.

Q. Well, you know that it was the piston, that it was that particular piston which was involved in the suit that the Aluminum Company of America filed against the Kant Skore Company in 1923, and it was tried, I think, in 1923. You know that, don't you? A. The Aluminum Company filed—I don't remember that.

Q. Well, I can't remember all these subsidiaries—Aluminum Manufacturers, I believe it was at that time, —was the name given to the subsidiary. A. Well, I think that suit was on the process patent.

Q. Yes, but the particular piston which was an exhibit in that case was exactly like Exhibit 3-Z? A. Yes. I don't know that I recall that there was such an exhibit, but there may have been.

Q. Well, you testified as an expert in that case, didn't you, Doctor? A. Yes. But I don't know what

exhibits were in the case, and if we had a piston like this before me, then I was thinking of it more from the standpoint of the structure of the metal in the piston and the process by which the piston had been made, rather than its design.

Q. Well, one of those patents involved a piston having a definite alloy of aluminum, copper, and magnesium, and other trimmings? A. Yes.

Q. And you must have examined the piston in that case, didn't you? A. Well, I don't know as I examined the finished piston. I examined piston castings.

Q. You don't even remember that you had that piston before you, or a piston exactly like that, a finished piston, when you testified? A. No, I don't remember that.

Q. You can't say then whether that piston was the one whose manufacture by Kant Skore Company caused the Aluminum Company to bring that suit? A. No, I can't say that. I don't know at the moment just which piston castings were involved, but I know that the Kant Skore Company made these pistons, made pistons like this and sold them.

Q. Oh, you do? A. Oh, yes.

Q. You know that they made those and sold them in 1923 around the time of the suit? A. Well, I don't know in 1923, but some time around 1923 or earlier.

Q. Well, the Aluminum Company of America or any of its subsidiaries, or Aluminum Manufacturers, wouldn't have brought suit and gone to the expense of bringing suit had the company put out a perfectly worthless thing which would put them into the hands of receivers anyway? A. Why, yes, I think so. That is one of the things they wanted to guard against, having worthless things go out onto the market.

Q. Was it a sort of high-minded thing to protect the dear public, to bring that suit? A. No, it was a business proposition.

Q. It was a straight business proposition? A. Yes, certainly.

Q. You know, don't you, that the Cleveland Trust Company, or The Cleveland Trust Company through the Aluminum Company of America, or through Aluminum Manufacturers, has been collecting royalty from Kant Skore on that particular piston? A. No, I don't know that.

Q. You don't know that? A. No.

Q. You can distinguish then between the collapsing effect of 3-Z and 48, can you? A. Yes. I know that type 3-Z piston collapses. I have seen a good many of them in the collapsed condition. Of course aluminum collapses a good deal easier than cast iron anyway.

Q. You mean by that that the 48 wouldn't be suitable for aluminum, Exhibit 48? A. 48 wouldn't be so good for aluminum,

Q. Would you say, as you said about the Kant Skore piston, that Exhibit 48 is just no good? A. No, I wouldn't say that.

Q. But you say Exhibit 3-Z is no good? A. Yes, yes.

Q. In spite of the fact that Exhibit 3-Z has got reliefs on it and Exhibit 48 has not? A. That is correct.

Q. One of your objections to the Spillman patent structure 1,335,176, and 3-Z is that it has slots on both sides which makes it worse? A. That is right.

Q. They could have been left out on one side, couldn't they? A. Yes.

Q. And that is done by the licensees under the Jardine patent, even if the Jardine patent does show two slots? A. Yes.

Q. Did you say that the Kant Skore Company went to the manufacture of a piston like Exhibit 1? A. Yes.

Q. And also the strut piston? A. Yes.

Q. Now, that Exhibit 1 was being used by the Ford Motor Company? A. That Exhibit 1 was being used by the Ford Motor Company, that is the Ford piston.

Q. Adopted as standard equipment? A. Yes.

Q. And it is a little bit hard to sell a jobber or a dealer anything except standard equipment? A. I don't know.

Q. But that was an advantage to cut down sales resistance that Kant Skore could put out a duplicate Ford piston or duplicate the car manufacturer's piston generally? A. I should say that was an advantage.

Q. What is the first split piston you ever saw in commercial use? I will limit it to that. A. Any kind of split?

Q. Yes, any kind of split. A. The Franklin, with the bottom of the skirt split.

Q. Like Exhibit B? A. Yes.

Q. And that was followed by the Long piston, wasn't it? A. Yes.

Q. And that was followed by the Kant Skore piston? A. Oh, you mean that was followed in my experience by the Long piston?

Q. Yes. A. Oh, I don't remember the second split skirt piston that I saw; but I think it was Jardine, was the second one.

Q. Like the Jardine patent in suit? A. Yes.

Q. Taking up next the Long patent 1,395,441, you say as you read that patent, the skirt is the same diameter all the way up to the ring groove 2? A. Yes.

Q. That is the way you understand it? A. Yes.

Q. That is what you understand the word "adjacent" to mean? A. Oh, it may mean a variety of things; it usually means near.

Q. It means "neighboring," doesn't it? A. Yes.

Q. Now, when the statement is made on page 2 of the specification, lines 4 *et seq.*, "In a piston of this improved character it is preferable to have the solid end 1 of the piston of a lesser diameter across the peripheral surface adjacent the piston ring recesses 2 than the remaining lower portions of said skirt." A. Where do you see "said skirt"?

Q. Oh, the "lower portion of the piston." Thank you. What are the parts adjacent the lower ring groove 2,—only the upper part? A. No, both parts are adjacent.

Q. And if anybody told you to have the solid end of the piston of lesser diameter across the peripheral surface adjacent the piston ring recesses than the remaining lower portion of the piston, you would stop right at the lowest ring groove? A. Well, I think that is where the line should be drawn, particularly in view, in this case, of Long's other two patents, one of which appears to be about the same date of filing as this one, in which he actually shows the head relief extending up to the horizontal slot.

Q. There is no question about the disclosure in the Long patent 1,489,499 and 1,872,772, as to how far the reduced diameter goes down? A. None at all.

Q. To the top of the slots? A. That is correct. Such an important point in that patent 1,395,441 should be singled out and pointed out.

Q. If you had these two patents before you, filed on the same day, 1,395,441 and 1,489,499, you would absolutely close your eyes to the statement in the second patent in considering the first one? A. No, I think I would open my eyes.

Q. You would open your eyes and you would actually use the same feature in the first patent that you would in the second; isn't that right? A. No, I don't believe I would. I think the two constructions are different. One is a double-walled structure; the other a single-walled structure.

Q. Whether double-walled or single?

Mr. Richey: Just a minute. Let him answer.

The Witness: I think that a point as important as that in patent 1,395,441 should be singled out as carefully as it is in the other patents.

Q. It should be repeated in every patent thereafter to the end of time; is that right? A. This wasn't a patent thereafter; it was a patent application that was concurrent with the others.

Q. I notice that neither one of these Long patents 1,395,441 and 1,429,499 show that there are oil holes in the wrist pin bosses. Don't you think that is a vital defect and therefore that the whole thing would seize? A. It is not an important point in what he thought was his invention.

Q. You don't think that is sufficient, then, to permit you to throw both of these Long patents out? A. Not on that ground, no.

Q. Suppose the Long patent structure, the one in 1,395,441 was used with the skirt of uniform diameter and you started to run it in a cylinder, wear would take place, wouldn't it? A. Yes.

Q. That would reduce the skirt in the region of the wrist pin bosses, just scuff it off? A. Why not,—I think it would reduce the skirt mostly in the upper part rather than around the wrist pin bosses.

Q. You don't think there is any chance then of this diametrical expansion pushing out the wrist pin bosses you have been talking about with reference to all these patents, especially since there is a slot separation on both sides? A. Oh, the wrist pin relief in combination with those other things would be helpful, but it depends on the clearance the piston is fitted in the cylinder, among other things.

Q. Well, whether you had relief or not, the skirt would expand in the region of the wrist pin bosses more than at right angles to it? A. Yes, it would.

Q. And it would begin to wear down, wouldn't it? A. It would bear against the cylinder there.

Q. And in the end you would have relief opposite the wrist pin bosses? A. Oh, I would hardly call that relief opposite the wrist pin bosses. You would also have some flexibility at the bottom of the skirt which would help push the boss region in in response to cylinder wall pressure in this piston.

Q. And the little narrow part above the slot 9a, Fig. 2, would wear off very rapidly, wouldn't it, if it wasn't of full skirt diameter? A. It might, if the clearance was small.

Q. But the parts bounded by the slots 9 and 9a would flex in? A. Yes, they would.

Q. Now, one of your objections to the Long patent 1,395,441 was that it has complicated slotting as shown in Fig. 1. That was one of your objections, wasn't it? A. Yes.

Q. Reading the patent, do you think that one skilled in the art would inevitably come to the conclusion that you had to use that particular slotting of 1 with the particular slotting of Fig. 2? A. Do you have reference to any particular part of the patent?

Q. No. But reading the whole patent, reading the patent and looking at the drawings, was it your idea in reading this patent that you had to use those two together? A. Well, the patent appears to be quite specific in its description of the drawings.

Q. It is your idea then, is it, Doctor, as you read patents like the Long patent and others, that you should not deviate one bit from it; that you should be sure to put Fig. 1 on one side and Fig. 2 on the other side of the piston?

Mr. Richey: I object as indefinite, unless he says what other patents he means.

Mr. Brueninga: Well, strike out "other patents."

A. No, I think that the patent should be read not only with the idea of its construction, but the mode of operation and the results in mind.

Q. Just answer my question.

(Question read as amended.)

A. I think that is an answer, isn't it, to your question?

Q. Your idea then, is—I want to make it clear without a lot of explanation—that as you gather the patent,

you wouldn't have to put Fig. 1 on one side and Fig. 2 on the other side; you as one skilled in the art would know that? A. No, I think not from this patent, unless there is something in the description itself that guides one in that direction.

Q. What is the difference between the Long patent 1,395,441 and Exhibit CCC? A. One difference is that in Exhibit CCC there is horizontal slotting on both sides of the piston, the horizontal slots separating the head section from the skirt section, whereas in the Long patent 1,395,441 the horizontal slots are in the upper part of the piston. The Exhibit CCC has only one vertical slot in one thrust face, and the other thrust face is left solid; that is another difference. Another difference is that the Exhibit CCC has generous relief around the bosses and extending to the top of the skirt, and the relief overlaps the horizontal slot on both sides of the piston. Exhibit CCC has combinations of elements, therefore, not found in Long. It also has a construction different from Long, and would have a different mode of operation and would give different results.

Q. But if the Long patent had added to it those features that you distinguish from it, there would be no difference? A. Axiomatically, so, if one made the CCC piston and incorporated the changes necessary to make it, and called it "Long," what you say would be true.

Q. But those three distinctions that you just gave me are the only three distinctions you can think of? A. Well, those are the essential differences, as I see it.

Q. And the first of them is due to the fact that since the lower ring land in Exhibit CCC is reduced in diameter to the same diameter as the ring land— A. Yes.

Q. —that therefore there is a separation of head and skirt? A. That is correct.

Q. The second one is that there is a relief in the region of the wrist pin bosses which is specifically described in the Long patent? A. Yes, except that relief is quite special in the CCC piston; it extends clear to the top of the skirt and overlaps the horizontal slots, which gives a combination of structural elements producing beneficial results.

Q. And the third one is that the slots 4-4 and 8, Fig. 1 of the Long patent have been left off of CCC? A. Yes.

(Thereupon, adjournment was taken to 1:30 P. M. of the same day, Tuesday.)

(At this point the testimony of Tibbetts, Record pages 877 to 895, was taken.)

(Thereupon at 9:30 A. M., Wednesday, March 22, 1933, the hearing was resumed.)

ZAY JEFFRIES resumed the stand for further Cross EXAMINATION.

Q. You were talking about the Long patent when we adjourned, Doctor, but I want to go back to the Monckmeier piston for just a little bit. When does an iron piston begin to pick up carbon? Oh, you can state it generally the time, distance, number of hundreds or thousands of miles. A. It is not a question of mileage; it is a question of temperature.

Q. It might pick it up in one day? A. Yes, yes, it might pick up carbon in one day.

Q. In noticeable, permanent deposits, hard? A. Yes.

Q. That is your opinion? A. Yes; the carbon isn't a question of time; it is a question of temperature and running conditions, and oil.

Q. In other words, you think that in the course of maybe an hour's running, an iron piston could collect carbon deposits of carbon which would have to be scraped off? A. Oh, I think so. As a matter of automotive engineering there are two temperature ranges that are critical in carbon deposits; one is that the parts should be kept below a certain temperature and then it will not carbonize; it should be kept above a certain temperature, and then it will not carbonize. It should be kept above a certain temperature, and then it will not carbonize. The piston heads sometimes get so hot that the carbon will not deposit on them; that is the upper temperature level.

Q. And you say that is not only true of the head, but down along the skirt say below the wrist pin boss on a piston like the Monckmeier piston 3-V? A. No, that can never get so hot that the piston will not carbonize.

Q. What do you say, how long it would take to cause a deposit of hard, fairly permanent carbon on it that would ha to be scraped off in order to get it off? A. I don't know. The matter of the hard deposit is one in which the temperature also plays a part, but the accumulation of carbon of course becomes much greater as time goes on. That is, a small deposit of carbon some times makes it easier for the next deposit to take place,

and so on, until the deposit builds up to the point where it flakes off, some times in the motor, or where it builds up to quite a thickness and becomes objectionable in the operation of the motor.

Q. Now, what causes the deposit of carbon on the head of a cast iron piston? A. It is the charring of oil which gets onto the head of the piston.

Q. It is a regular frying process, like putting oil in a frying pan, isn't it? A. Yes, a good deal.

Q. Now, that extends for some distance along the piston, along the sides of the piston? A. That may, or the carbon from the flame may be carried down the piston by the gases. Of course any kind of yellow flame is just full of carbon, full of soot.

Q. And that frying process is the greatest at the hottest spot, isn't it? A. No, at the hottest spots the oil can completely volatilize; that is, a piston head can be hot enough so that the carbon will not deposit on it.

Q. That didn't happen in 3-V, because there is carbon on the head? A. Well, it didn't happen at some stage of 3-V or in all parts of 3-V.

Q. But an actual frying process did happen in 3-V? A. I think so, yes.

Q. And an actual frying process also happened in the region of the wrist pin bosses? A. Oh, I couldn't say that; I don't know.

Q. There is where the greatest amount of carbon is on the Monoknecier piston, isn't it? A. No.

Q. Apart from the head? A. Oh, apart from the head. Well, apart from the ring grooves, too, and that deposit is very thin.

Q. But that deposit in the region of the wrist pin bosses is the greatest on the entire skirt; isn't that right? A. It is the most evident.

Q. And that is the hottest part of the skirt if you have connectors and slots in it? A. Yes, it would be.

Q. Doesn't that to your mind, Dr. Jeffries, prove that piston actually did run with the slots in it so that the hottest part of the piston was right in the region of the connectors where the greatest amount of carbon was deposited? A. No, that doesn't prove that at all. There is another reason why carbon might be deposited there, and that is the weaving of the skirt as a result of the wrist pin pressures, would have a tendency to have that adhere there and to make cavities for the oil to get in. There are also two little oil grooves there for the oil to run. There is no way, as I mentioned on my direct exam-

ination, for me to tell whether the slots were in the piston when it was being run or whether they weren't, and I don't think it makes any difference as far as that is concerned; but the evidence on the piston itself is in the direction that the slots were put in after the piston had been run, such evidence as I can gather.

Q. Such evidence as you can gather. There is none whatsoever that they might have been run for several hundred or a thousand miles with the slots in them? A. Not the slightest, no more than the deposit of carbon around the bosses of Defendants' Exhibit 3-H piston would indicate that the skirt had to be slotted while the piston was being run.

Q. It is a fact, isn't it, that if those slots are in 3-V, those cross slots are in 3-V, the hottest part of the skirt is right in the region of the wrist pin bosses? A. That is correct.

Q. It is also a fact, isn't it, that those slots are in there and if you have a splash system, oil can splash into those slots and to some extent start that frying process in those slots? A. Yes, to some extent. But if that were the case, the oil would be spread over certainly the upper surface of both of the horizontal slots, and that portion would be hotter than the skirt portion adjacent the bosses, and that should have charred and produced carbon in those slots.

Q. In an automobile having a crank case and where you have splash lubrication, there is a continual fog of oil in that crank case and going up into the piston; isn't that right? A. There should be at each stroke.

Q. Well, at each stroke that may be true, but the pistons run so fast that there is a continual fog right inside of those pistons; isn't that right? A. Well, I don't know what the conditions were there; but I do say that if the conditions were right for charring at this particular point, the end of the horizontal slot near the boss which is not cracked, then the condition should have been right for charring 1/16" or 1/32" from that particular point in the upper surface of the horizontal slots.

Q. Now then, to get a clear picture of the piston, particularly a cast iron piston, still more particularly Exhibit 3-V, the hottest part of that piston is the head? A. Yes.

Q. The top of the head; and then the temperature gradient goes down, the hottest part of the skirt in a piston like 3-V is in the region of the wrist pin bosses below the connectors; let's call them congectors; that is right, isn't it? A. That is correct.

Q. And in such a piston like 3-V, slotted as you have it here, the coolest part of the skirt is below the horizontal slots, the region below the horizontal slots? A. Oh, the coolest part of the skirt is the bottom of the skirt. The coolest part of the top of the skirt is just below the horizontal slots. I would like you to keep in mind in these answers that these horizontal slots do not make the usual head-skirt separation in Exhibit 3-V. The head-skirt separation, that is the guide section, goes up at least to the lands on either side of the top.

Q. Yes, I am taking your answer with that reservation when I am talking about the skirt, I was talking about the skirt part below the horizontal grooves. A. Yes.

Q. And the grooves themselves as well as the lands in the piston are continually subjected to oil or spray or splash? A. Yes, they should be; so is the cylinder wall, which continually subjects the outside of the piston to oil.

Q. Now, you called particularly attention to the pistons Exhibit F and Exhibit E the Long pistons, and the collection of carbon deposit on those pistons, particularly in the slots. You have every reason to believe that those pistons were run in a Franklin air-cooled engine? A. Yes.

Q. And that the cylinder of that engine becomes very hot, does it not? A. Yes, it gets quite hot.

Q. Much hotter than a water-cooled engine? A. Well, hotter than most of the pleasure car water-cooled engines, yes.

Q. You would rather expect more deposit of carbon in a piston in an air-cooled engine than in a water-cooled engine, wouldn't you? A. In certain parts, yes; not necessarily on the head.

Q. Examine Exhibit 48 and tell me whether after the cutting of that slot there is not evidence of a springing of one part with respect to the other, especially at the top? A. Yes, there is.

Q. That takes place when you split a cast iron piston? A. Some times it does and some times it does not.

Q. That springing may be either in or out? A. Yes, it may be either in or out.

Q. Depending on the strains that are set up during the casting; is that right? A. That is correct.

Q. And such a thing could just as well happen in the Monckmeier cast iron piston, Exhibit 3-V? A. Yes, it might.

Q. One of the advantages of an aluminum piston is that it will conduct heat quickly; isn't that right? A. Yes.

Q. And a cast iron piston will not conduct heat nearly as quickly as an aluminum piston? A. No; about one-third, I think.

Q. A cast iron piston therefore runs at a higher temperature than an aluminum piston in actual service under the same conditions? A. Under the same motor conditions, that is correct.

Q. And therefore the liability to deposit carbon on a cast iron piston is much greater than where an aluminum piston is used? A. In the lower range, yes.

Q. What do you mean by the lower range? A. Well, I mean that with the lower temperatures encountered in the motors it is easier for a cast iron piston head to be heated hot enough so that it will not take a carbon deposit than does an aluminum head.

Q. Where a cylinder is run at a rather high temperature, there is considerable wall warpage, isn't there? A. There may be; there may not be.

Q. Now, if the Monckmeier piston, particularly 3-V, had not been reduced in diameter above the slot, that narrow ledge would soon wear off, wouldn't it? A. Well, I don't know how soon it would start to wear, because that would be the wearing of the upper part of the piston.

Q. Well, as an extreme, if it came to a point, it would wear off very quickly? A. Well, it might break off in that case.

Q. And the quickness of wear is determined by the vertical depth of that ledge, or I might say annular part between the lowest ring groove and the horizontal slot? A. That is one factor. The kind of use it has is another factor, and the degree of oiling is another factor. There are a lot of factors involved in wear. The amount of dust that gets into the carburetor is more important than any of the other factors.

Q. But if that wear did take place, it did not necessarily mean that the wings, what I might call wings, that is, the free part bounded by the horizontal and vertical slots, the wings could flex in? A. The wings, if they were slotted during the time when the piston was in the motor?

Q. Yes. A. Oh, they would have to flex. That piston, if it were slotted in use, that bottom of the skirt would have been quite flexible, and nothing could have prevented the bottom part of this piston from flexing

during the operation; but during the wearing off of this annular part above the slot, the side sections of the piston bounded by the horizontal slots and the vertical slots would be allowed to flex in while this wear of this annular part took place, that is true; it would have no part, however, in helping the piston to operate, because if the piston were slotted, the slotted part would wear just the same as the other part.

Q. But then as the wear took place, the slap would not increase, would it, as the wear on this annular part took place, these parts would still flex in and slap not take place? A. Oh, no, I don't think that is correct.

Q. You don't think so? A. No, I don't think that is correct. There has been ample clearance in that piston, slots or no slots.

Q. You say ample clearance because Mr. Monckmeier said it was fifteen thousandths? A. Well, measurements indicate it wasn't fifteen thousandths. The measurements indicate it was twenty thousandths or more, even when the piston was new, and a good deal more than that later.

Q. You say twenty-thousandths because you figure just about what the wear might have been? A. No, no; I say twenty-thousandths because the motor was supposed to be a 4½" bore motor.

Q. And you don't know what the diameter of that piston was when it was put in? A. Well, it wasn't large diameter, from the diameter across the boss faces on the skirt.

Q. You don't think there might have been wear across the boss faces? A. Not on the skirt, not very much.

Q. Then all of your talk about relief isn't so important, that is, relief in the region of the wrist pin bosses? A. Not when you have clearance like that, not when you have clearance enough to allow the piston to be heated 700° hotter than the cylinder, then the whole thing is relieved.

Q. Now, in an engine of the size of the Staver engine that you heard Mr. Monckmeier talk about, having only splash lubrication, that lubrication wasn't very efficient, was it? A. Yes, it is quite efficient.

Q. Splash lubrication? A. Yes, for lubrication. It is not very efficient for oil consumption, but it is very efficient for lubricating.

Q. Isn't it a fact that at high speed the cranks make almost a hole in that oil? A. Well, I know that to get

the best lubrication, especially with some of these aluminum pistons, they found the splash system to be preferable. It is not good for oil consumption from the standpoint of number of miles run per gallon of lubricating oil consumed; but it is quite efficient from the standpoint of doing a good job of lubricating.

Q. When a piston seizes, it usually seizes at the skirt, doesn't it? A. It usually seizes at the top of the skirt, yes.

Q. And with considerable wear of a piston such as Exhibit 3-V you would expect the diameter above and below the slot to be equal; isn't that right, after considerable wear? A. Not quite. The portion above the skirt is hotter, the portion above the horizontal slots is hotter; therefore in operation it would rub the cylinder a little harder than the portion below, and after the piston cooled down to room temperature, then that portion above should be a little less in diameter as a result of wear.

Q. In order that the master may have an idea of the measurements, what is the thickness of an ordinary piece of writing paper? A. I don't know that I have ever measured it.

Q. Do you know what the thickness of an ordinary piece of cigarette paper is? A. No.

Q. Do you know what the thickness of an ordinary hair is? A. Yes.

Q. What is it? A. From one thousandth to four thousandths of an inch.

Q. Now, you took these measurements of Exhibits 3-V and 3-W, and particularly 3-V. That is pretty rusty, isn't it? A. Yes.

Q. The rust on each face might be over a thousandth of an inch? A. Oh, around a thousandth, may be, yes. I can conceive of a thousandth variation in any one of the measurements that I took.

Q. Well, that was particularly true in the region of the wrist pin bosses where the carbon collected? A. Oh, most any place, I think, on the piston. The rusty surface is not conducive to fine or close measurements.

Q. I believe it would be well to explain the present method of oiling pistons as used in engines, pick out any one in which there is a direct oiling of the pistons as distinguished from splash lubrication, or in addition to splash lubrication? A. Well, there is one in which the connecting rod is made hollow throughout its length, and oil is forced through this hollow connecting rod up to the

wrist pin section and sprayed out into the interior of the piston during operation. That is not the most common type, however. I think the most common type is one in which the oil pressure is developed by a pumping system and at each revolution of the crank shaft a little jet of oil is squirted under pressure up into the cylinder bore. It produces what Mr. Bruninga has called a sort of fog or spray of oil in the bore of the cylinder.

Q. Now, let's continue with the Long patent 1,489,490. Look at Fig. 5. Is it your contention that there is no flexure of the web 8a during operation? A. Well, the webs would flex, yes, in the boss axis, but there is no flexibility of the webs in the thrust axis, as I see it.

Q. As the metal part of part 4, Fig. 5, between 8a, and 8a expands, the webs must flex? A. That is not a flexing of the webs, that is merely a change in position due to increase in temperature.

Q. Well, if there is no relief in the region of the wrist pin bosses, and with the skirt in the region of the wrist pin bosses bearing against the cylinder, and with these bosses again supported from the top of the skirt, don't those webs 8a actually have to flex as the expansion of 4 takes place with increase in temperature? A. Oh, no, they couldn't flex as the result of any change in the part 4. They would be flexible in the other direction, to an extent, that is, across the boss axis.

Q. They would flex along the boss axis, wouldn't they? A. Yes, they should, and the lower on the piston the greater the flexing, and by the time you reach the top of the skirt that would be very small.

Q. Would about the same flexing take place in the part 11, Fig. 4 of the Gulick patent, between the webs 17 and 18? A. Oh, no. The flexing in those Gulick webs would be very substantial.

Q. Because designed for flexing? A. Yes, and because of the complete horizontal separation and the vertical separation between the two webs. That construction is all in the direction of making the Gulick structure flex.

Q. You keep in mind, of course, that the part 4 is separated both vertically and horizontally from the rest of the piston in the Long patent 1,489,499? A. Yes.

Q. You don't think that is comparable at all with the parts 11, 17 and 18 of the Gulick patent, Fig. 4? A. No. No, I think if you took out the two slots, 5, and put in one right in the region of the figure 4, then those webs

would operate more like the Gulick webs, but as they are I don't see how they can.

Q. That is, if you took out the slots 5 in the Long patent, then flexing would take place? A. Oh, by putting in the slots in the right place.

Q. Now, your objection to this patent, at least one of the objections is that it is a double-walled structure. By that you mean it cannot be conveniently cast in a permanent mold? A. That is one of the objections to the double-walled structure, yes.

Q. You don't see any difficulty in making cores for that piston, do you, permanent mold cores? A. Yes, there would be difficulty.

Q. But it could be done, couldn't it? A. Possibly.

Q. As a matter of fact it is a simpler proposition than Exhibit E, assuming of course the slots will be cut later on in both cases? A. Yes, I should think it could be made as easily as Exhibit E.

Q. And Exhibit E is no doubt a permanent mold cast piston? A. Yes, it was cast in a permanent mold.

Q. Now, turning to the Long patent 1,872,772, one of your objections to this patent was it was too complicated. Is it more complicated than the Gulick patent structure? A. It is perhaps not more complicated in its structure, but it is more complicated in its operation.

Q. The fact is that it can be cast in a permanent mold? A. Yes, with difficulty.

Q. While Gulick's could not? A. That is my opinion, yes. The Gulick drawings, as shown in the Gulick patent, could not be cast in a permanent mold.

Q. Why do you say, "With difficulty," Doctor? How much experience have you had in casting pistons like Exhibit E? A. Well, I haven't had very much personal experience in casting pistons like Exhibit E, but I have had a lot of personal experience in casting pistons in permanent molds. I know this is regarded as a difficult permanent mold job.

Q. But Mr. Long was selling those pistons in competition with Cleveland Trust Company's licensees, wasn't he? A. I don't know whether he was or not.

Q. Well, you know that Mr. Long was sued for infringement of the Cleveland Trust Company pistons because he was manufacturing pistons of that kind, don't you? A. No, I didn't know that.

Q. It has been said here by Mr. McCoy that the suit was dismissed after Long agreed to be good and buy

his castings from licensees. I believe you heard that, didn't you? A. I don't recall. I didn't pay any attention to it if I did hear it.

Q. Do you know anything about that? A. No.

Q. If I am not mistaken the reference was at that time had to Exhibit FFF. That is really a fine piece of work, isn't it, so far as permanent mold casting is concerned? A. Yes, that is a very fine piece of casting.

Q. Well, suppose it is complicated and suppose it is difficult to cast, what does that mean—increase in cost? A. Yes, very substantially.

Q. What do you call "substantial"? A. Well, I mean that a piston like that would be too expensive to use in motor cars generally.

Q. It wasn't found too expensive to use, was it? A. Apparently wasn't for a time in the Franklin Motor Car, but that is a high priced car and was at the time that these pistons were being used in it.

Q. But still Franklin continued to use those pistons until 1926? A. Yes.

Q. And as early as 1922 the Maynard type piston was on the market, wasn't it? A. Yes.

Q. And to your knowledge not a single Maynard type piston has been used in the Franklin car, has it? A. Not without the other modifications, at least.

Q. What other modifications? A. Well, with the Invar Struts.

Q. Oh, you call that Invar Strut piston a Maynard type piston? A. No, I don't call it a Maynard type piston, but it may have some Maynard features in it.

Q. Then your objection to a double-walled structure is the complication of casting, isn't that right, that is what it comes down to? A. Oh, that is one, and extra weight is another. It is not so economical or commercial as the single-walled structure.

Q. And all of those objections also go to the Gulick piston as illustrated in the drawings? A. Yes, that is true, but there are other features of complications in the Long piston and in its structure and its mode of operation which do not apply to the Gulick construction.

Q. In spite of that fact Long has been on the market and Gulick has not? A. The Long type of piston has been on the market and the Gulick type piston, as shown in the Gulick drawings, has not been on the market.

Q. And one of your objections to the Long patent is, again, that it does not describe relief in the region of

the wrist pin bosses? A. That is correct, it does not describe such relief in combination with other features, such as horizontal and vertical slots, to gain skirt flexibility.

Q. But it does clearly disclose, without any question, the reduction in diameter of the piston to the top of the horizontal slot? A. Yes, it does.

Q. I believe I understood you to say if that feature was used relief in the region of the wrist pin bosses was not so necessary? A. No, it would not be so necessary as it would be in the other Long construction which we were discussing; it would still be helpful, however.

Q. Now, you took up Exhibits E and F, and then selected the sand cast piston, and you made a number of observations as to improper operation, carbon collecting on it, and all of that. You knew of course that Exhibit F is a sand cast piston, don't you? A. It is a sand cast interior, at any rate; and I don't know that it is a sand cast exterior, however.

Q. You don't find those objectionable features as to the blow-bys and collection of carbon, and scoring and so forth, on Exhibit E, the die casting, do you? A. Not to the same extent, the wearing surface is in pretty good shape in Exhibit E.

Q. You don't find the side at the bottom of Exhibit E has collapsed in? A. No.

Q. You don't find hard rubbing opposite the webs, do you? A. No.

Q. What do you think caused that in Exhibit F, the sand cast piston? A. Well, it is a combination of clearance and temperature, has been such that the wall pressure has been high during operation in Exhibit F, and there is no evidence of very high wall pressure in Exhibit E. I have seen many trunk type pistons with no slots at all that have the same kind of surface as Exhibit E. Among other things, it is a matter of how much clearance the piston is given and the effectiveness of the lubrication.

Q. As a matter of fact, the hard rubbing opposite the webs was caused by the fact, really, that the webs expanded out and pushed that cylindrical part against the cylinder, isn't that right? A. Yes. But in order to do that the webs had to become quite hot, or the clearance of the piston had to be relatively small.

Q. What do you say, do you think the webs weren't flexible enough? You have the piston before you, so you

ought to be able to tell something about it? A. No, there is flexibility in the webs.

Q. But still there is this rubbing, apparently due to expansion of the webs outwardly? A. Yes, but as I have mentioned before, that is a matter of the design of the piston and also the clearance with which it is fitted. One can fit the Maynard piston so that it seizes this way or rubs this way. No piston construction is in itself a cure-all against piston troubles. The piston has to be fitted in a certain way. My thought in this was that it was perhaps fitted or intended to be fitted so it would not slap, but it apparently was not fitted loose enough for that particular piston under the conditions of operation.

Q. You made the outright statement that the piston didn't function properly in service. Did you have that piston F in mind or the Long pistons generally? A. No, I had the piston F in mind particularly, and I think I was describing the collapsing of one of the side walls of this piston and the scoring on the thrust faces.

Q. You didn't have the Long pistons generally in mind, did you? A. I don't think I had them generally in mind with that statement, but generally speaking, the Long pistons were not satisfactory.

Q. What do you base that on? A. I base that on my general piston experience and with the information that I have got from time to time with respect to pistons in operation in the United States.

Q. From whom did you get the information with reference to the Long pistons in the Franklin engines? A. I got it from the automotive engineers of the Aluminum Company.

Q. Oh, the automotive engineers of the Aluminum Company? A. Yes.

Q. Of course they were boosting the Long pistons, were they not? A. Oh, they weren't; but they were continually in touch with the Franklin Company and would come back with repeated tales of how they weren't satisfied with their pistons.

Q. And I suppose the Aluminum Company offered the Franklin Company a better piston than the Long pistons? A. Yes, they eventually did.

Q. In 1926? A. Yes, it was earlier than that that they offered th m a better piston.

Q. Why didn't the Franklin Company take a better piston earlier than that? A. Oh, they had quite a period

of testing. I don't know just why they didn't make the change earlier.

Q. Was the Gulick piston offered to them just exactly as shown in the drawings? A. No.

Q. Wasn't the Jardine piston shown to them just as shown in that drawing? A. No.

Q. As a matter of fact it was shown to them just as shown in that drawing, wasn't it? A. Not that I know of.

Q. And don't you know the Franklin Company would not have the Jardine piston? A. No, I didn't.

Q. Do you know whether the Maynard patent piston was offered to the Franklin Company? A. No, I don't know whether it was or not.

Q. And then finally in 1926 the Franklin Company turned over to the strut piston? A. That is correct. In so far as I know, they haven't complained since.

Q. Did you say that the Aluminum Company of America made castings for the Franklin Company from 1920 to 1926 for those Long pistons? A. Well, I don't know the exact date, but they made castings for the Franklin Company from about 1920, as I recall it, to about 1926.

Q. And that Long piston was a more expensive piston than either the Jardine or the Maynard piston? A. Yes. They paid, I know, considerably more for their castings than they would have for the others.

Q. And in addition paid Mr. Long a substantial royalty? A. So I understand.

Q. And you can't explain that at all, can you, why the Franklin Company should pay a higher price for the Long pistons and pay Mr. Long a royalty, when the Jardine and the Maynard pistons were available to the Franklin Company for a period of from five to six years? A. No, I really can't explain it.

Q. You cannot offer any explanation at all? A. No. Nor can I offer the explanation why they slotted the bottoms of the skirt of the old Franklin type piston.

Q. But you do gather from all of that that the Long piston was no good, while the Jardine and Maynard patent pistons were far superior? A. The Maynard piston is far superior for general purposes; there is not any question about that. So far as the application in the Franklin car is concerned, I can't say. I do know from my own experience that Franklin was complaining about piston trouble from 1916 until about 1926.

Q. People are still complaining about piston troubles, are they not? A. Not very much. The piston situation is pretty satisfactory today.

Q. As a matter of fact Ford did change over when he started to put out his V-8, didn't he change over to this particular piston, Exhibit 3-J, didn't he? A. Yes, he did, but that was a much smaller piston than the Model A piston, and his V-8 for 1933, I understand, is right back in the direction of the Maynard piston.

Q. And Chrysler in the Plymouth changed over to 3-O? A. That is correct. They have changed over in the Plymouth to a piston like Exhibit 3-O.

Q. But what I want to bring out, there is a continual change in the piston design even today? A. Oh, yes, there is progress being made. This 3-O piston is an advance in the art of aluminum pistons.

Q. You think it is an advance in the art over the Maynard patent? A. Yes, I do, especially for small diameter pistons.

Q. Do you think it is an advance in the art over any of the particular illustrations shown in any of the other patents in suit? A. I think it is, yes. It involves combinations which make it very desirable for small diameter pistons, at any rate.

Q. Now, you said that the Aluminum Company submitted various designs to the Franklin Company. What designs did the Aluminum Company or one of its subsidiaries submit to the Franklin Company? A. Well, I don't know just which ones they did submit, but they submitted the Invar strut design eventually, and they were accepted.

Q. But I understand that your statement was that various designs were submitted to the Franklin Company before the Invar strut was accepted? A. Well, I think they were, yes. Automotive engineers of the Aluminum Company were in contact with the Franklin Company at fairly frequent intervals from say 1916 on to the present time.

Q. They were trying to get pistons, too, weren't they? A. Yes.

Q. And they tried to take, in a perfectly business sense, away, tried to take that piston business away from Long; isn't that right? A. Oh, no, I don't think so.

Q. But I don't mean in any unfair way; I mean just in the natural course of business, tried to get busi-

ness for the Aluminum Company of America. A. They were trying to evolve a piston which was satisfactory both in operation and in cost and in the manufacture, which they finally did.

Q. But you can't tell me what designs were submitted to the Franklin Company? A. No, I can't. But I suspect that they tested a lot of pistons.

Q. Well, was your statement that a number of designs were submitted to the Franklin Company just based on suspicion, or what was it based on? A. Oh, no, it is based on my contact with the Aluminum Company automotive engineers.

Q. But you can't tell me any specific design that was submitted, can you? A. No, I cannot. In fact, I couldn't give you the specific design of the Invar strut piston that they used or that they started to use in 1926.

Q. Well, I am not interested in any details you mention. Can you tell me whether the Jardine piston was ever submitted to them? A. No, I can't.

Q. In other words, after all of your success with the Jardine piston, of the Aluminum Company, you never even submitted it to the Franklin Company? A. I don't know whether it was ever submitted to them.

Q. Can you find out what designs were submitted to the Franklin Company? A. Oh, I think I possibly could, if there is any point about it.

Q. Well, there must have been a point to it because you stated that various designs had been submitted. A. Yes.

Q. And now you can't tell me what designs had been submitted? A. That is correct.

Q. Now, turning to the Hives British patent drawing, you placed dividers across that space in Fig. 2 and you found out that the diameter along the wrist pin axis was greater than at right angles to it; is that right? A. Yes, that is right.

Q. What difference was there? A. Oh, not very much; enough to be readily seen with the sharp point dividers.

Q. You notice in Fig. 2 very distinctly a center mark, don't you, that had the center of a compass? A. No, no, there is no centering mark.

Q. What is that part right there? A. That just happens to be some kind of spot. There is nothing like it over here; there is no hole through the paper.

Q. I don't mean a hole through the paper, but I mean there is a spot right about in the center of that circle. A. Yes, there is a spot.

Q. There is a spot? A. Yes, there seems to be another one a good deal like it off to the side a little ways.

Q. But there is no hole through that paper? A. No.

Q. Now, do you know what process is used in making drawings, of making reproductions like a British patent? A. No.

Q. Well, you know it is a photo-lithographic process, don't you? A. Well, I don't know what process.

Q. Well, you don't think each one of these was separately drawn up in Great Britain with pen and ink, do you? A. In the printed copies?

Q. Yes. A. Oh, no; these copies are printed, of course.

Q. Now, assuming this to be a photographic process, Doctor, if the sheet were held perfectly flat and the camera was 100% O.K., you would get a perfect reproduction? A. Yes.

Q. But if the sheet were held, for instance, concave or convex, that is with the convexity along the vertical line, or the concavity along the vertical line, the reproduction of a perfect circle would show the axis, the horizontal axis larger than the vertical axis, wouldn't it? A. Yes.

Q. And the same might be true, the reverse might be true, if the sheet were concave or convex along a horizontal axis? A. That is correct.

Q. So you wouldn't for one minute say that it was contemplated by the British patentee that the major axis, I mean the axis along the wrist pin bosses, should be greater than the axis at right angles thereto? A. Oh, I wouldn't say that that was necessarily contemplated. I merely pointed it out.

Q. As you read the statement in the specification, page 1, lines 33 to 38, is it your idea that the British patentee contemplated the oval section to be from the line A-A, Fig. 1, downward? A. That is correct.

Q. That is what you read into it? A. Yes.

Q. That wouldn't make it work, would it? A. No, not very well.

(Short recess taken.)

Q. Now, Doctor, as you read that Hives patent, the oval cross section being from the slot A-A down, the

Q. As far as the relief in the region of the wrist pin bosses? A. I had in my mind this type of relief shown here on Fig. 1; horizontal slotting is shown at the separation between the head and the skirt, and this 1d relief is shown extending out and overlapping the horizontal slotting, and of course that gives the skirt an opportunity to deform.

Q. Well, let's stick a little bit to the relief in the region of the wrist pin bosses, and compare Franquist with Mooers in that. A. That is shown also. The relief is shown by this dotted line 1d, Fig. 2, and the relief overlaps the horizontal slotting, as shown at the upper boundary of the relief, which is in part the lower boundary of the horizontal slot.

Q. Oh, I see. I think I get you. In other words, in the Franquist patent this slotting, horizontal slotting, does not go into the relief? A. That is correct.

Q. That is your position on that? A. Yes. I may say that the Mooers effect in the 3-O piston is not as great as it would be in a construction like the Mooers patent, or like the Maynard patent, but the principle of them still operates in the 3-O construction.

Q. Now, let's get each other clear now. It is your position then, that the Mooers patent distinctly shows the feature of having the horizontal slotting go into the relief? A. Yes.

Q. There is no question about that? A. Not as I read the drawing.

Q. And in the Franquist patent the horizontal slotting stops just at the relief? A. Either at or short of the relief.

Q. And in the Ford piston exhibit, Exhibit 3-J, the horizontal slotting does not go into the relief? A. Well, the horizontal slotting goes into the relief very substantially in the Ford 3-J.

Q. But still you don't consider that as having the improvement of the Mooers patent? A. No; because of the vertical slot. If that piston were operated without the vertical slot, then the Mooers principle would operate.

Q. But as soon as it has the vertical slot, then the Mooers principle ceases to operate? A. Yes. The forces within the piston then can no longer operate to help distort it to conform to the cylinder. The distortion has to take place, or the flexibility, as the result of cylinder wall pressure. Or if the 3-J piston had the horizontal slot on the other thrust face, then it would, to an extent, have the Mooers operation.

Q. And in 3-O it is because the slots don't go to the bottom of the skirt that it embodies the improvement of the Mooers patent? A. That is correct.

Q. In other words, extend the slot to the bottom of the skirt and it does not embody the improvement of the Mooers patent? A. No.

Q. But still you say the other exhibits like BBB and CCC and Exhibit 1 embody the feature of the Mooers patent in there even though the slot does extend to the bottom of the skirt? A. Yes, those all embody the Mooers principle of operation because there is a horizontal separation between the head section and the guide section on one of the thrust faces which is not vertically slotted.

Q. In order to embody the feature of the Mooers patent, it doesn't make any difference how much horizontal separation you have, provided you have some and provided you have that horizontal separation running into a relief; is that your position? A. Oh, my position is that Mooers discloses a principle there which is effective in combination with some of these other features, in helping to reduce clearance in the piston, and when that feature is clearly embodied, then I consider that that is taking advantage of the Mooers principle, and consider Exhibits 1 and BBB and CCC as embodying that principle for the purpose of helping to reduce the overall clearance.

Q. Now, since you have stated your theory, you may be able to answer my question. I ask the reporter to please read the question.

(Reporter reads question, beginning: "In order to embody the feature of the Mooers patent.")

A. No, as I said, I think it must be enough to do some good. I think I included that in my other answer.

Q. You can't tell me just how much the slot would have to run around or how much it would have to run into the relief; you can't tell me that, can you? A. No, I can't tell you that. I think that when a description like this is given and the principle is disclosed, that it must be enough to do some good.

Q. And you just make the statement it does some good, and that is all you want to give? A. Not only some good; it does enough good for people to pay money to use it; that is, to put money into construction and machining to take advantage of it.

Q. Have you tested pistons like Exhibit 3-O? A. No, I have not.

Q. Do you know what its actual construction is? A. Construction?

Q. Yes. A. I think so.

Q. Do you know whether the skirt tapers from top to bottom? A. I think it does not, but I wouldn't be sure of that.

Q. Well, I want to tell you it tapers one and a half thousandths from bottom to top. A. In Exhibit 3-O?

Q. Yes. Now, do you know how much clearance there is on the wrist pin axis? A. No.

Q. You haven't measured that? A. No.

Q. Have you any idea how much clearance there should be in a piston of this kind in order to function so as to embody the improvements of the Mooers and Gulick patents? A. Enough so that when the boss axis wants to expand and pull in the skirt, it is not hindered by pressing against the cylinder wall, with respect to Mooers. I don't think there is any such limitation with respect to Gulick.

Q. Now, your position is that because the slot in 3-O doesn't go to the bottom, it functions like Mooers? A. Yes, in combination with the other features.

Q. And your position is that even though the slot does not go to the bottom, it still functions like Gulick? A. At the top of the skirt, yes.

Q. Now, you said you did not test the pistons Exhibits 3-J or 3-O, or pistons of that construction. Is that true of all of the other accused devices here like Exhibits BBB and CCC, that you haven't made any actual tests on those? A. All the exhibits?

Q. Well, how about BBB and CCC? A. I made no tests on either BBB or CCC.

Q. Your information, then, is again founded on your experience and what you know of pistons in general; is that right? A. Yes, and what I have seen of Exhibits BBB and CCC, and just the hand flexing tests that I have given them.

Q. All right. Now taking Exhibits 72-A and 72-B, you said you performed some bath-room tests on that piston. What were they? A. I said I performed some tests on some bath-room scales. I took the skirt part of this piston, Exhibit 72-B and put it on the platform of some bath-room scales and pressed downward until the slot closed at the bottom of the skirt. I noted the dial reading, which gave me the number of pounds pressure necessary to close the skirt at the bottom with the skirt detached. Then I took another piston of the same kind,

except with the head integrally attached to the skirt, a piston in fact like Plaintiffs' Exhibit 1, and stood on the side of it while my little daughter watched for the point when the bottom of the slot was closed. And I found it took practically my full weight to do that, so, taking the ratios of the two forces, my estimate was that the bottom of the skirt in a piston like Exhibit 1 is fifteen times stiffer than the bottom of the skirt when the skirt is detached from the piston.

Q. You knew that without making that test, didn't you? A. No, it was quite a surprise to me, and it was quite a surprise to the automotive engineers that have been working with these pistons for years.

Q. You mean to say that a head split is easy to close? A. Oh, I knew it would be less, but I had no idea it would be fifteen times, 15 to 1, and that is 15 to 1 in the most flexible part. The ratio becomes steadily higher as the top of the skirt is approached.

Q. You would expect that, wouldn't you? The skirt is attached to the head? A. Oh, yes, I would expect that.

Q. So that it would be practically immovable at the top? A. I don't know what you mean by "practically immovable."

Q. Well, there is very little movement of the skirt at the top where it is attached to the head? A. Well, there is some, of course, enough to be the difference between success and failure in a piston.

Q. And you assume right along that that action takes place in an engine that you have been talking about? A. Yes, I know it does.

Q. You know it does? A. Yes.

Q. Now, do you think that is the sort of action that takes place in the cylinder, a pressure along a diameter? A. That is only one of the many complicated forces.

Q. Well, as a matter of fact there is a diametrical expansion of that piston due to heat along every diameter; that is, at least of the head? A. Yes, that is true. And then the head is very hot, too, as compared with the bottom of the skirt.

Q. And the sides of the piston along the wrist pin bosses are carried out on account of the diametrical expansion along that axis; is that right? A. That is true. There is a force pulling that out, at any rate.

Q. As far as the diametrical expansion of the head along a diameter at right angles to the wrist pin bosses,

that is not applied directly to the skirt? A. No, it is not; not with the horizontal slots.

Q. But the web does expand diametrically, does it not; I mean at least the web does expand with the head, does it not; it is carried out? A. Yes, it has a tendency to do so.

Q. It is carried out along a diameter again, is it not? A. Yes, it has a tendency to do that.

Q. So that the forces that act inside of an engine are not by any means the simple forces that you have when you simply move Exhibit 72-B by pressing along the lines of the wrist pin bosses? A. No, they are not that simple. I thought I had made that quite clear. And I don't believe that any one has ever made quantitative analysis of the forces in a piston, and if they did so at one temperature or under one set of conditions, they would have an infinite set of conditions different from that one set to take into consideration. So that the forces tending to expand the skirt and expand the head and distort, and so forth, are very complicated. Not only that, the properties of the material change with temperature, even the modulate of elasticity of the material is less at the higher temperature than it is at a lower temperature. So you have a continuing differing stiffness of the metal itself from the head down to the bottom of the skirt. So that all those things combine to make the forces both inside the piston and the forces exerted by the wall against the piston extremely complicated and extremely variable.

Q. You didn't try Exhibit 72-B with a wrist pin inside, did you? A. No.

Q. That wrist pin doesn't have a slot in it, does it? A. At the higher temperatures when the flexing is necessary the fit is fairly loose in the wrist pin. In fact, a little too loose to suit the automotive engineers. In order to make the fit proper so that the wrist pin will not seize at sub-zero temperatures, the clearance of the wrist pin is, as I say, quite a bit when the piston is hot, and it is only when the piston is hot that the flexing is needed.

Q. In demonstrating 72-A to the Court, you flexed these little thin skirt parts; you actually flexed them in, didn't you? A. Yes.

Q. That doesn't really happen unless you have a bump of the cylinder, this flexing in like you demonstrated to the judge, that doesn't happen in the cylinder, does it? A. Why, that would happen as the result of the pressure of the skirt against the cylinder wall, yes.

Q. You want the Court to understand then, where you have a cylindrical wall engaged by a cylindrical skirt, that there is an actual pushing in of these little pieces at the end? A. Yes, I think that is correct. The force is not necessarily the greatest right at the slot to produce that flexing in; the force is extended over the whole of the bearing area.

Q. Over the entire bearing area, isn't that right? A. Yes.

Q. And in order to get any movement at all, you have got to get a movement of one cylinder, cylindrical surface, with respect to each other as a whole, don't you? A. Yes; they will do that.

Q. If there is a bearing all around, the initial movement must be the same at the ends of the cylindrical part as at the center? A. Well, there are other movements going on simultaneously, so that, again, it is an extremely complicated action. It is not a simple lever action.

Q. Now, when you took Exhibit 1 and you put the micrometers on it and then you flexed it in at the bottom of the skirt, closed that slot or closed it as much as you could with your hands, you got a sort of leverage action on this part that we can call the web, where the wrist pin bosses are; isn't that right? A. Yes, that is correct.

Q. In other words, the force acts sort of diagonally on that web instead of a straight flexure from along lines parallel with the head of the piston along the webs just below the head? A. Well, I don't know just how it acts. That again, is quite complicated. The uneven section of the skirt and the nature of the skirt between the head and the skirt, all combine to make that a fairly complex action.

Q. But you still want the Court to understand that the very small part from the head where the web connects with the head to where it goes into the cylindrical part of the skirt, that is, this corner, that will actually flex in operation, this short little arm? A. You seem to be very much disturbed about the flexing of some particular little spot in the piston. Now I have said that this web is flexible. It is flexible because it is made of a flexible metal; it is flexible because the web is made thin; it is flexible because of the horizontal slot; it is flexible because of all these relationships; and I have demonstrated that it does flex in response to a force which I can apply with one of my hands on the piston, and the

answer that I make is that that portion of Exhibit 1 is flexible enough to function satisfactorily in the motor in combination with the other elements in that piston.

Q. You understand by "that portion," you mean this little part at the top of the slot just about 1/8" long? A. No, I am not pinning it down to any little part, Mr. Bruninga. I don't see how one can pick out any one little part of this piston and make very much of a calculation about it by itself. Taken in connection with all the other elements of the piston, I have demonstrated, both to my satisfaction, and I hope to the satisfaction of others, that that construction has flexibility at the top of the skirt.

Q. But can't you answer my question when I ask you, do you want the Court to understand that in the operation of the piston the part about 1/8" of an inch long flexes? A. Yes, I think it does. I think I have said that a good many times. I think I have got very good grounds for saying it, although I don't know that that itself makes a whole lot of difference, because Maynard doesn't necessarily say that that particular part has got to flex; he gives a construction which operates in a motor and the construction is similar to that construction of Exhibit 1.

Q. I agree with you that Maynard in his patent nowhere states that that part is flexible. But I have reference to the Gulick patent, in which flexibility of web is relied upon, and that is what I had in mind when I asked you that question. A. You mean that the web does not extend into the curved portion in Exhibit 1?

Q. That is what you consider, that it extends into the curved portion? A. Certainly.

Q. Doesn't it extend clean out to the slot, then? A. It may, if one wants to consider it that way; but this particular part is cast in in Exhibit 1.

Q. I understand it then, in Gulick you must consider the web as running from the wrist pin boss clean to the slot 21; is that right? A. No, I wouldn't consider it that way in Gulick.

Q. As a matter of fact in Gulick, when you talk about a web, you are talking about 18 and 17, the connection between the wrist pin boss and the skirt; isn't that right? A. That is correct.

Q. And that is what I was trying to have you apply to Exhibit 1, that same web. Where do you find it in Exhibits 1, 17 and 18? A. I haven't found in Exhibit

1 that this curve on the end is carried to the inside of the piston in the casting; it is even put in the cores; and certainly I should say that that is intended to be considered as the total web; that is, up to the point where the cast-in portion joins the skirt. But I didn't even take advantage of that curve, which makes for more flexibility in my measurements. I put my measuring surfaces right where Mr. Stellman said that the piston was too stiff.

Q. Let's get down now to cases. We are all agreed, I believe, particularly yourself, that where flexibility is necessary is at the top of the skirt? A. That is where it is most necessary, yes.

Q. You don't care much about the bottom of the skirt? A. I don't care very much about it in general, no, because that can be gotten easy by itself, but to get flexibility of the bottom of the skirt in combination with the flexibility at the top of the skirt is no small problem.

Q. It was demonstrated to your satisfaction by the fact that the Plymouth car, as in Exhibit 3-O, that the slot doesn't have to extend to the bottom of the skirt, and that flexibility of the bottom is not important at all? A. Some means of taking care of expansion at the bottom is desirable, and that means is provided in Exhibit 3-O in another way.

Q. By the usual matter of relief? A. No, by the unusual practice of oval grinding and also that has to combine with a certain thinness of the piston wall, and it will be found that Exhibit 3-O has a very thin piston wall at the bottom of the skirt. Those things all have to combine to make Exhibit 3-O function properly even at the bottom of the skirt.

Q. It was quite a distinct problem to design Exhibit 3-O, then, wasn't it? A. I know it was. Exhibit 3-O represents 1932 and 1933 engineering.

Q. Quite a departure from anything that preceded it? A. No, not quite a departure, but improves over anything that had preceded it.

Q. Of course, all within the teachings of the Gulick patent? A. Not all, no, but embodying the teachings of the Gulick patent.

Q. Well, the important thing then is to have the skirt split at the top; that is the important thing, isn't it? A. That is important, yes. All of these infringing devices here have skirts split at the top in combination

with a horizontal separation between the head portion and the skirt portion, and that is important to get flexibility at the top of the skirt.

Q. And you mean the accused infringing devices. Now, in the Gulick patent, splitting of the skirt is supplemented by flexible webs, that splitting of the skirt at the top is supplemented by flexible webs 17 and 18? A. In the Gulick drawing, yes.

Q. When you talk about flexible webs, you must have reference to flexibility of the web at the top? A. Flexibility of the web so that it will permit flexing at the top of the skirt, so that it will permit flexing of the skirt at the top, yes.

Q. And that is what you must have had in mind when you considered Exhibit 1; isn't that right, flexibility of the web at the top? A. Flexibility so that the skirt at the top can flex. It should be obvious that the flexing of the web in Exhibit 1 at points below the horizontal separation will help the flexing at the top of the skirt. Again, showing the complicated nature of the forces.

Q. Now, you found a flexing there of what we will call the web at the top, of in the neighborhood of six thousandths of an inch? A. That amount of flexing is more, I think, than it really did flex. I think the real amount of flexing was more like two or three thousandths.

Q. Then in your opinion a flexing of two or three thousandths of an inch of a structure like Exhibit 1 is sufficient to meet the conditions? A. Oh, yes, that would be ample.

Q. You are sure of that, that the flexing of that amount, two or three thousandths, is enough? A. In this piston Exhibit 1, yes; I am certain of that.

Q. And that is only one slot? A. That is correct. That has other means, however, of compensating for clearance.

Q. If you had four slots, you would only need one fourth that much flexing at four different places? A. Not necessarily.

Q. Well, let's go back to the Franquist patent. Your position is that that skirt is absolutely inflexible, isn't it? A. Oh, no; I said that skirt simulated a trunk type skirt piston. I can't say it is absolutely inflexible, but it is rigid.

Q. Now, the tests you previously performed on it was a diametrical contraction test; isn't that right? A. Yes.

Q. And you performed the same tests on an ordinary trunk type piston; isn't that right? A. Yes.

Q. You would expect those results, wouldn't you? A. No, I didn't; I was very much surprised.

Q. Didn't you know that when you take any hoop, whether split or not, and you start to contract it diametrically, that it doesn't make much difference how many protuberances there are around there on the inside or outside, that it is the weakest part that yields? A. Well, I may not know as much about hoops as I should, but I was surprised to find that that Franquist skirt behaved like a trunk type skirt. I was surprised that I did not observe the flexibility of the skirt that the Franquist patent says there should be.

Q. Now, taking for instance, comparing pistons Exhibits 3-H and 3-Q, you actually found that as far as pressure applied at diametrically opposite points—I am just taking these for illustration—just taking 3-H for illustration—pressure applied at diametrically opposite points caused about the same pressure in these two types? A. Yes, that is correct. The Franquist type, I think, even was a little stiffer.

Q. You would expect that on account of the corrugations? A. Well, I didn't expect it, but it was true.

Q. But you did not apply a circumferential contraction test, for instance, with a pair of clamps like this Exhibit 34; you didn't apply a test like that? A. No, I didn't.

Q. That is nearer to the actual conditions that are encountered in automobile practice than a simple diametrical pressure; isn't that right? A. No, I wouldn't say that it was. It would be in the piston that had a circular cross-section, perhaps.

Q. But take a piston like Exhibit 3-H and applying this clamping device to it, you wouldn't expect me to be able to compress that at all, would you, with my hands? A. No, I would not.

Q. You would not expect that at all, would you? A. No, I would not.

Q. Would you expect me to be able to contract 3-Q? A. I should think so, some.

Q. You would think so? A. Yes.

Q. Now, what is the difference, and what happens? A. The difference is that you have the tremendous pressure put on circumferentially and you get a little flexing in these ribs.

Q. And these slots actually close up a little? A. I should think they would, a little bit.

Q. And when they actually close up a little bit, that means that the circumference of the whole piston has decreased? A. Yes, I should think so, a little bit.

Q. You have never tried it with 3-Q? A. No.

Q. Now, it is your opinion that it doesn't make much difference whether you expand these ribs inwardly or not and increase the length of the slot, that, if anything, will make the piston stiffer? A. Yes, I rather think so; it will be stiffer at least against diametral distortion.

Q. Even as to the closing up of these slots by applying a clamping device to it? A. I don't know how that would affect it; it might make it a little more perceptible, circumferentially.

Q. Well, you haven't tried that out, have you, Doctor? A. No, I haven't tried it.

Q. I want to hand you a piston marked for identification Defendants' Exhibit 5-L. Examine that with reference to 5-Q. Those two constructions look about the same except that the internal ribbing has been increased, don't they? A. Yes.

Q. And except that the wrist pin has been left out of 5-L? A. Yes.

Q. Now, Doctor, I want you to watch me perform a few little experiments. I am going to take a half a dollar and insert it in one of these slots. (Counsel does so.) Now, that is loose at this time, isn't it? Now, put it in first,—let the Master put it in loose. (Half dollar is put in and Mr. Brumfuga applies pressure with clamping device.) You find that tight, don't you? (Referring to half dollar being held in slot.) A. I find evidence of a little flexing, yes.

Q. But that means I have actually contracted that piston circumferentially; isn't that right? A. I suspect so, although I would like to get the measurements all around to make certain of that. And the pressure that you have used is, I would say, twenty times what would be allowable in a motor to produce such a result. You have used a tremendous leverage to get that result.

Q. I suppose that in your demonstration of Exhibit 1, you didn't use a leverage that was much in excess of that used in a motor? A. I don't know what leverage might be obtained in a motor, but I only used the forces that I possess in my right hand, just one hand.

Q. Don't you think with that leverage that you used at the bottom of the slot in Exhibit 1, that that was multiplied say from twenty to fifty times at the bottom? A. Oh, it would multiply some, certainly; but I don't know how much and I don't know how to arrive at any figure to show how much it is, but I would not expect you to be able to flex this piston, Exhibit 5-L, with your hand enough to either see or to tighten a half dollar when put in one of the grooves.

Q. Now, I am going to try each one of the other slots in succession. (Counsel does so, putting half dollar in each of four slots at bottom and then at top of the skirt and applying clamping device after each insertion.) A. I should like to put the micrometers across a section while it is being flexed.

(It was thereupon found that the proper size of micrometer was not available for the piston in question.)

Q. Well, Doctor, just try a scale across here. This is graduated in 64ths of an inch. See if there is a movement there.

(Applying clamping pressure with clamping device.)

The Master: I thought it was visible.

Mr. Bruninga: I will try it along the lines of the wrist pin bosses now. (Counsel does so.)

The Witness: What is needed is two simultaneous diameter measurements; that is, to see whether or not the pressing in on one diameter may not correspond to an expansion in the other diameter. It may even do so on a piston like Exhibit 3-H, although I can see none on Exhibit 3-H. It is not possible for me to see any movement with a scale on Exhibit 5-L.

Q. But now I have the clamp on the piston again, and I want you to tell me whether you cannot see a distinct movement, slot-closing movement of one of these slots, which is the one having a little nick, the single nick, right near the point where the entrance comes from the outside diameter? A. Yes, I can see a little movement there with the eye.

Q. Now, any closing of that slot like was demonstrated by putting coins in those slots, means that there was a circumferential contraction, wasn't there? A. Not necessarily.

Q. Oh, how could a slot in there close, Doctor, without decreasing the circumference? A. There may be an increase in diameter in a direction at right angles to the two supporting ends of the clamping device.

Q. Now, you have previously stated that two thousandths of an inch is sufficient for practical purposes in Exhibit 1, a deflection of two thousandths. A. In combination with the various other elements in Exhibit 1, and if it does not take too much force to produce that two thousandths of an inch deflection. Of course if it should take enough force to make the piston press too tightly against the walls or to score or to rub so that the power would be lessened, then the piston would not function properly.

Q. Now, two thousandths is the thickness of a rather small hair? A. Yes, the average hair.

Q. You can't even see a movement of two thousandths of an inch, can you, with the naked eye? A. I think not.

Q. Would you still think that the Franquist patent piston, the piston disclosed in the Franquist patent 1,152,902 is just plain no good? A. Yes, yes, I still think that.

Q. And you still think that the piston would seize in a cylinder if constructed like Exhibit 5-L, I mean with the ribs just simply expanded inwardly—I don't want to tie you down to any specific construction—and with reliefs in the region of the wrist pin bosses? A. It would either rub too hard against the cylinder wall or it would slap, one of the two; that is my opinion.

Q. You have never taken the trouble to take a set of these Franquist pistons and put them in an engine to determine whether they would actually work? A. I have not, no.

Q. And that is in spite of the fact that a number of suits were pending on that patent? A. Well, I didn't know about that.

Q. Well, you knew at least one, the Simmons suit was pending? A. Well, I made other tests at that time.

Q. But these theoretical tests that you made in a testing machine of simply pressing that Franquist piston diametrically, which I take it was a piston like Exhibit 71-B, satisfied you thoroughly as to its impracticability? A. Why, it satisfied me that it was too stiff to operate properly and to operate the way the patent said it should operate, and I think that the fact that you have come in here with a piston that has grooves some twice as deep as in the drawing shown in the patented construction, is

pretty good evidence that my conclusions were correct there. Furthermore I said it didn't operate like the patents in suit, anyway. It is supposed to operate according to a kind of accordion principle rather than the simple flexing principle of Gulick and the other flexible skirt patents in suit.

Q. You don't see any particular departure between that Exhibit 5-L and the Franquist patent by the mere fact that the depth of those ribs is increased? A. Well, it is a departure from the drawing of the patent and it is a departure from the piston that you brought in here as representative of the patent, and it is different from the standpoint of construction, in that the construction which you brought in last would be a more difficult one to make, to make it economically.

Q. But when you found out that a structure like 71-B did not show up good, you quit right there, didn't you? A. When I found out how stiff the skirt really was, when I found out it wouldn't flex practically, I was satisfied.

Q. And you didn't proceed any further to lengthen out those—or rather deepen out those slotted ribs to see whether you could make it work that way? A. No, we had no infringing devices with those features on.

Q. You didn't have any infringing devices for the simple reason that the patent was about to expire; isn't that right? A. No, if that were a good patent, everybody would be making the pistons now except the licensees of the Cleveland Trust Company, perhaps.

Q. But you didn't look at that patent and read it and re-read it with a view of trying to make that piston operative to suit you, did you? A. Yes. During the time I went over that patent I tried to find all the good in it I could. I was very much disappointed.

Q. And you were consulted before any suit was brought on that patent? A. No.

Q. Against the Simmons Company? A. No, I wasn't consulted before any suit was brought on that patent.

Q. That was the first time you ever looked at that patent after the suit had been brought? A. Yes, it was.

(Short recess taken.)

Q. Of course, your position is, Doctor, that if one side of Exhibit Q, that is, if one of the slots was completely cut through here, then the thing would not work at all; isn't that right, if one of the vertical slots was

cut clear in two? A. Well, it wouldn't work at all, well, no; you would have all the real cylinder wall pressure on the solid part of the skirt right adjacent to the slot, and the thrust face then would be quite flexible.

Q. Flexing that lever arm from one side of the horizontal slot to the other? A. That would not be a good construction.

Q. You remember the Hartog patent that we had up on prima facie, that had a construction along that line? A. Oh, not like that, no.

Q. No; but I mean that the skirt was divided to one side of the piston and there was just simply one segment that moves in and out? A. Yes, a long spring, very flexible arrangement.

Q. You didn't consider that good at all? A. No.

Q. You know of course that Mr. Hartog was in interference with Mr. Gulick in the Patent Office—the record shows that? A. Well, I have just heard of the Hartog-Gulick interference, that is all.

Q. You don't know whether any objection was made by the owner of the Gulick patent that the Hartog structure was inoperative and therefore the interference should be dissolved entirely? A. I don't know anything about that.

Q. Now, you made the statement that hundreds of thousands of pistons were made as illustrated in the Maynard patent and without the relief, which is so plainly evident in Exhibit 1 where the cylindrical surface joins the so-called webs—that is what you meant? A. Yes.

Q. That it didn't have those reliefs on it? A. That is right.

Q. And when you said "hundreds of thousands" what did you base your information on? A. On records that I looked at in connection with the Oakland piston and the Maxwell piston.

Q. Did you see any of those pistons installed in any engines? A. No.

Q. You don't know, then, whether they might have filed off or dressed off the parts corresponding to the reliefs in Exhibit 1? A. I don't know exactly. I don't think it would make any difference whether they did or not.

Q. I am not asking you whether it would make any difference. But you don't actually know whether those pistons went into those cylinders in that shape? A. I didn't see them. I saw the drawings, which did not call for any special clearance at that point.

Q. I am again asking you what you know; not what you saw from a drawing. A. I don't know.

Q. You don't actually know whether any of those pistons ran for a hundred miles without the relief? A. Oh, I didn't follow up the tests; but I know it and people know things even that they haven't exactly seen.

Q. But I am asking you now what you know, from a legal standpoint; because the law of evidence, unfortunately being against your views, requires knowledge rather than suspicion or founded upon what somebody else told you.

Mr. Richey: Well, that is not a correct statement of the law under the circumstances.

Q. You don't know now whether any of those pistons were ever used in any engine for any length of time, say a thousand or two thousand miles, without having some sort of relief put in them? A. From the standpoint of actually seeing the pistons and going in the motors and measuring them, and tearing down the motors and looking at them, that is correct.

Q. There is not a single one piston today of the type of Exhibit 1 but what has that relief? A. If you want to call it relief. I think the pistons today all have a smaller bearing surface in some way at the top of the skirt than would be indicated by merely bringing the web out straight.

Q. I believe you said that the Ford Motor Company is not now using pistons like Exhibit 3-J, but more along the lines of Exhibit 1? A. That is correct.

Q. As a matter of fact, in that Ford piston as used today that relief goes almost to a point, doesn't it? A. Yes; not almost to a point, but it goes not very much farther than is in Exhibit 1. That is the bending of the web in there, or relief, or whatever you want to call it; the web is actually cast in there, however.

Q. Well, the relief is just about along the lines of the pencil mark, isn't it; it is about that much in the new Ford piston? A. Yes. The pencil mark is pretty wide. It is more like the pencilling that is now heavily made.

Q. In other words, the top of the relief would be around 5/16" from the vertical slot, around about that? A. I should say so.

Q. That is the way the pencil mark shows? A. I should say so. That applies, as far as I know, only to the new 8.

Q. To the small piston? A. To the small piston, yes.

Q. And that is true on each of the thrust faces? A. Yes, it is, and the piston is slotted on both sides horizontally and it is not cam-ground any more.

Q. Have you a sample of that piston? A. No, I haven't.

Q. Where did you see it? A. At the Aluminum Company plant.

Mr. Bruninga: Since the witness has talked about it, can't counsel produce one?

Mr. Richey: I don't know whether I can or not. I haven't one.

Mr. McCoy: I never saw one before.

Mr. Bruninga: The witness brought it in; I didn't bring it in.

The Witness: Well, it is immaterial, isn't it?

Mr. Bruninga: I don't know whether it is or not. This matter of relief has come up. I believe it is incumbent upon counsel to produce such a piston as can be readily obtained around town.

The Witness: I don't know what you want to do that for.

Mr. Bruninga: You mean—

The Witness: Well, you are just extending this case—

Mr. Bruninga: Are you talking as counsel?

The Witness: Off the record.

Mr. Bruninga: No, let it go on the record.

The Witness: I have four or five things I have been trying to get out now for ten days, and other people are trying to get me to go over to different places to do things, and I certainly should like to get through with this thing.

Mr. Richey: Of course, if I had the piston and it is material, I would produce it; but I haven't the piston. If the Master holds it is material and should be brought in, and the witness will bring it, that is satisfactory to me. But the record shows this whole thing about the relief you are talking about is immaterial.

The Master: I don't know now whether it is or not. If the other side wants to produce it, very well; I don't see why it should be ordered to be produced; that is up to the parties.

Mr. Richey: I have no objection to the witness producing it; I haven't got it. Of course nobody

here has any authority, not even the court, to require the witness to produce a thing.

The Master: I didn't say that.

Mr. Richey: I beg pardon; I didn't mean that. But your Honor probably knows what the rule is and has seen it invoked in other cases of this kind.

Mr. Bruninga: I am going to leave it up to you. If you want to produce it, all right; if not, I move that all the testimony with reference to what Ford is doing now, be stricken out.

Mr. Richey: What part is that?

Mr. Bruninga: All reference to what Ford is now using as distinguished from Exhibit 3-J.

Mr. Richey: What part of the answer?

Mr. Bruninga: On direct and cross, both.

Mr. Richey: What is it you want striken out?

Mr. Bruninga: If it is so immaterial, I ask that it be done. You know well enough what you are going to do; you are going to tell the court later on that Ford changed over after trying something else.

Mr. Richey: All right, we join in the request that the witness produce this piston. Of course he can do what he wants to.

Mr. Bruninga: If the witness doesn't produce it after recess, I am going to move that reference to that Ford piston be stricken out, particularly since it is immaterial.

The Witness: I will get the piston. If there is anything else you want, I wish you would mention it now.

The Master: Anything further?

Mr. Bruninga: No.

(Thereupon adjournment was taken to 1:30 p.m. of the same day.)

(Thereupon at 1:30 p.m., Thursday, March 23, 1933 the trial was resumed.)

RE-DIRECT EXAMINATION by Mr. Richey.

Q. Can you produce the piston that Mr. Bruninga asked for just before lunch, and if so will you do so? A. I produce the piston asked for.

Mr. Richey: I offer it in evidence as Plaintiffs' Exhibit 76.

Mr. Bruninga: Of course I want to save my objection until I find out what the witness knows about this piston.

Q. You have been asked during your cross examination a lot about the alleged relief at the ends of the webs in Plaintiffs' Exhibit 1. Will you state whether or not that is a relief or an extension of the web, and give your reasons for your answer? A. I would consider the portion of the skirt in Plaintiffs' Exhibit 1 near and at the top of the piston on which evidence of grinding is present, to be the skirt portion proper, and the remainder of the top portion of the piston below the head section, to consist of webs. These portions are cast into the piston and have counterparts of the depression on the outside of the piston wall in projections in the inside of the piston wall. It appears to me that the webs may be considered as the parts extending up to the portion of the outer wall of the piston which has been machined.

Q. How long has the Aluminum Company of America marketed pistons like that Plaintiffs' Exhibit 1? A. With the bent-in webs, do you mean?

Q. Yes. A. I couldn't say exactly, but I should say with that construction or its equivalent since, say, 1923 or 1924.

Q. Do you know whether or not that same kind of piston has been marketed and sold by any other licensees of the Cleveland Trust Company? A. Yes.

Q. Which others? A. The Bohn Aluminum & Brass Company.

Q. Any others to your knowledge? A. Also the Aluminum Industries, which I understand is a licensee of the Aluminum Company of America.

Q. Now, will you state whether or not any or all of these licensees were making that kind of piston before the Sterling Products Corporation began the manufacture of it, if you know?

Mr. Bruninga: That is immaterial, your Honor. The Sterling Products Company is not involved here at the present time. If you restrict it to the parties—

The Master: What do you claim for that question?

Mr. Richey: Well, we claim that the manufacture of these pistons duplicated the commercial piston of the licensees of The Cleveland Trust Company, followed in their footsteps.

Mr. Bruninga: In addition, I believe it should be brought out that that witness knows about this, not just guessing.

The Master: I think he may answer and you may have your exception.

A. The Bohn Aluminum & Brass Corporation was, to the best of my knowledge. I don't recall of seeing the particular pistons manufactured by Aluminum Industries of this particular type.

Q. What about the Aluminum Company of America? A. Oh, the Aluminum Company of America was, to the best of my knowledge.

Q. Now, you were asked about the flexion of these webs, particularly with respect to length and thickness of web. Will you state what if any relation there is between flexion and thickness, and also between flexion and length? A. Yes, the other variables being the same, the flexibility of a web would be directly proportional to its length. But the relationship between the thickness of web and flexibility is not a direct proportion; that relationship varies as to cube of the thickness. That is, if a web is doubled in thickness, it will be eight times as stiff; and if it is halved in thickness, it will be only one-eighth as stiff.

Q. You were asked about your knowledge of manufacture of and use of pistons like those shown in the Maynard patent with straight webs or without what Mr. Bruninga has called "relief" at the ends of the webs. Will you state whether or not you have yourself seen any commercial pistons of the Maynard type without that so-called relief? A. I have.

Q. And where and to what extent? A. I have seen many of those pistons in the laboratories of the Aluminum Company and in the Aluminum Company plant.

Q. Under what conditions did you see them in the plant? A. I have seen the pistons before they have been put in the motors and I have seen them after they have been put in motors and taken out again.

Q. Now, in this piston business, the car or engine manufacturer furnishes the drawings to the Aluminum Company, for example, or whoever makes the piston casting, don't they? A. Yes.

Q. That is the practice, is it? A. Yes, either that or they accept a drawing proposed by the Aluminum Company.

Q. And that drawing being furnished to the manufacturer of the castings, what does the manufacturer of the casting do? A. He designs a piston casting in such a way that when it is machined, it will correspond with the customer's approved drawing.

Q. And what is the custom as to manufacturing or machining the castings with respect to the drawing? A. The custom is to machine the casting to the drawing.

Q. And if there are any changes made in the casting that are not shown in the drawing, what is the custom? A. The custom is to incorporate the change in the drawing.

Q. And then what was done with respect to the manufacture of future castings? A. The future castings would correspond with the changed drawing until some other change is incorporated.

Q. I have concluded as the result of the questions that were asked that our adversary might contend that some of these corners at the ends of the webs in some of these pistons you said were made after the Maynard patent might be filed off. Would you state whether or not it would be feasible to do that, particularly in such large quantities as you said those pistons had been made and used? A. No, that would be very improbable in a manufacturer's plant.

Q. Why would it be improbable? A. Because it would be necessary, to reduce the cost of machining the pistons, to make the operation standard and incorporate it in the construction, rather than endure the extra cost of hand-filing of any part of the piston.

Q. During your cross examination you were shown this model 5-L, Franquist type of piston, Defendants' Exhibit 5-L. Would you compare that in construction, mode of operation, and results, with the pistons of the patents in suit?

Mr. Brunings: I forgot to offer in evidence that particular piston, Defendants' Exhibit 5-L. I now offer it in evidence.

The Master: It may be received.

A. My comparison would be substantially the same as the comparison with the previous Franquist piston, Defendants' Exhibit 3-Q. The discussion with reference to the locking of the steel wrist pin, for example, with the set screws and the relationship of the grooves and the horizontal slots, would apply to Exhibit 5-L the same

as to Exhibit 3-Q. The piston does not embody the Schmiedeknecht construction, and I do not believe it could operate like the Moocrs patent in suit. The relief mentioned in the Franquist patent specifies that the section which is to be relieved, is the portion around the bosses indicated, I think, as 14 in the Franquist patent. This would mean that the relief would stop suddenly at the tops of the vertical grooves on either side of the bosses, and consequently, there would not be the opportunity for the piston to function like the Moocrs patent, even if the wrist pin were not locked tightly by set screws in the bosses. The construction is not like any of the other three patents in suit involving flexible skirts, because the other patents all combine horizontal and vertical slotting of the piston skirt to enable the skirt section to flex in response to cylinder wall pressures. The mode of operation of the Franquist piston is also different from that of the flexible skirt patents in suit.

Q. You mean Exhibit 5-L? A. Yes, 5-L. And the result would be different.

Q. You spoke on cross examination about it was not so much the matter of getting this two thousandths contraction but how it was gotten. Will you explain more in detail what you mean by that? A. I said that I thought two thousandths of an inch flexing in the web of Exhibit 1 at the top would be ample to allow that piston to function. That two thousandths of an inch, however, is not on the whole diameter of the piston, but it is on only a portion of the diameter. That makes two thousandths of an inch more potent in compensating for extra expansion than two thousandths of an inch on the whole diameter of the piston. Furthermore, such flexing as there is of the webs at the top in Exhibit 1, co-operates with relief and flexibility of the skirt and possibility of distortion as the result of cylinder wall pressures on the slotted sides, and the Moocrs principle on the unslotted side, to compensate for the extra expansion of piston Exhibit 1. So that the entire compensation does not have to be taken care of by web flexing in Exhibit 1.

Q. State whether or not there is any importance as between the relation of the yielding of the piston and the pressure at which it yields? A. Oh, that is all-important; that is, the compensation for extra expansion as the result of cylinder wall pressure must be gained with moderate wall pressures or the whole object of the piston is defeated. If the wall pressure necessary to produce

the flexing is too great, the power is reduced as a result of this excessive wall pressure or the piston may score or seize, or the cylinder may score. It is essential that the compensation for extra expansion be provided by moderate cylinder wall pressures in order to gain the advantages of the flexible skirt piston.

Q. In other words, the yielding may come too late? A. Yes, it may.

Q. Now, look at these so-called Franquist types of pistons 5-L and 3-Q and the others and compare their point of yielding with that which is necessary to prevent scoring. A. Well, as near as I can judge from all that I have seen and the tests that I have made, the amount of pressure required to produce any substantial or helpful amount of yielding in the skirts of pistons 3-Q and 5-L, would be too great for practical purposes; that is, the piston would bear too hard against the cylinder walls to give a practical result.

Q. Speaking of scoring in this connection, will you look at this Ricardo type piston Exhibit 73, and state what caused the irregularities on one side of one of the slippers? A. Yes, that is a typical case of scoring. That piston opposite the end of one of the webs has been bearing very hard against the cylinder wall. In fact, that degree of scoring would very greatly reduce the power obtainable from a piston operating in a cylinder, and the condition would be unbearable in service.

Q. If the web continued to expand, what would happen? A. The scoring would be still worse.

Q. Up to the point where it would seize? A. Yes.

Q. As shown, it has been so great as to press the metal over into the relieved part, hasn't it? A. Yes; it has exerted a force greater than the elastic limit or yield point of the metal itself.

(Short recess taken.)

Q. Will you next look at the Schoengarth special piston Exhibit 5-K10 and compare that in structure, mode of operation and results, with the piston of the Gulick patent?

(Addressing Mr. Bruninga.) You are only relying on that against Gulick, aren't you?

Mr. Bruninga: Yes.

A. This piston, Defendants' Exhibit 5-K10 has a construction and devices designed to make the skirt section adjustable. It is a rigid construction when ready

to operate, being not substantially different from a trunk type piston. The skirt is designed to be fixed in diameter when the piston is cold and to retain the same relationship between the various parts of the piston as a trunk type piston would when heated. The piston being so constructed, its construction is different from that of Gulick, its mode of operation is not different from the mode of operation of the trunk type piston, whereas the mode of operation of Gulick is one in which the skirt is flexible and is destined to flex during the operation of the piston itself. Because of those features, the mode of operation of Defendants' Exhibit 5-K10 is different from that of Gulick, because also of the differences in construction, and mode of operation, the result of Defendants' Exhibit 5-K10 is different from that of Gulick. It is true that in securing the adjustable feature there is a horizontal separation between the head section and the guide section, and there is a vertical slot in one of the thrust faces connecting the horizontal separation with the bottom of the skirt. These features of the construction, however, do not co-operate with other features in the piston during the operation of the piston. Such flexibility of the skirt as is obtained by the slotting alone, is used only in the first installation of the piston, and then at any future interval in which an adjustment is desired. The skirt is only flexed, therefore, at one or relatively few intervals in its whole lifetime, and the flexing does not co-operate with the other parts of the piston while the piston is in operation in the motor. So far as operation in the motor is concerned, therefore, Defendants' Exhibit 5-K10 might be just as well a trunk type, non-flexible skirt piston.

Q. Would the motor be running when the adjustments are operated there? A. No.

The Master: This one is manually flexible. The other one is automatically flexible?

Mr. Richey: Yes, that is one way of expressing it, of course for entirely different purposes.

Q. You were asked to remeasure one of the parts of the Monokmeier cast iron piston and make a correction on Exhibit 74, which you did? A. Yes, sir.

Q. This correction was in the amount of one-thousandth of an inch. Will you state whether or not that change in dimension would change in any way any of the opinions you have given with respect to the Monokmeier piston or any of the other testimony you have

given with respect to it, except that difference of a thousandth of an inch? A. That difference, by the way, was ten thousandths of an inch.

Mr. Bruninga: I didn't stress that; I just wanted to have these figures appear correct; that is all. I didn't make any point of that at all.

A. The change in the measurement which represents a correction over my previous measurements, does not change my testimony, with one exception: I believe that when the piston, Exhibit 3-V, was new, the top of the guide section would be represented approximately by the lands on either side of the upper narrow ring groove. It is clear, however, from the corrected measurements, that during the later stages of operation of this piston, the whole head has been functioning as part of the guide section; therefore in the later stages of operation of this piston, the guide section has extended to the very top of the head. So the conditions were really worse than I had concluded from my earlier measurements.

Q. This piston, Defendants' Exhibit FFF bears the initials "W. M. L. Co." and the name "Magnalite." Do you know what company that was that had those initials and used that name? A. Yes, that is the Walker M. Levett Company.

Q. So it was the Walker M. Levett Company and the Aluminum Company of America that sold these so-called Long type pistons to Franklin and not Long? A. Yes, that is true with respect to the permanent mold pistons, at any rate.

Q. Now, during your examination you have spoken of the combination of the elements and the co-operation of the elements in these pistons. I wish you would explain what you mean by that. Take, for example, the piston shown in the Maynard patent and that shown in Exhibit 1. A. I had in mind that the various features of the construction of the piston like Exhibit 1 co-operate with one another, all at the same time, to help to produce the beneficial results, that is, with the horizontal slot, the vertical slot, the webs, the difference in diameter between the head and the skirt, may all be operating at the same instant in the piston and each may be modified by the other or at least one may be modified by others in the operation of the piston.

Q. You say "they may be." Will you state whether or not they do as a fact co-operate together? A. Yes, they do.

Q. Where did you get this piston you produced here, Exhibit 76? A. From the piston plant of the Aluminum Company of America at Harvard Avenue, Cleveland.

Q. State whether you know that is a Ford piston, and if so, how do you know it? A. It has the name "Ford" cast on one of the webs. I don't know from first-hand information by being at the Ford plant or from any correspondence or visits that I have had with the Ford Company that this is their piston for the 1933 V-8, but this is the piston that is being manufactured for Ford, at least the castings for such pistons are being manufactured for Ford at Harvard Avenue, and I have every reason to believe that that is the piston which Ford is now using in the 1933 V-8 engine.

Q. Well, that has the Ford trade name on there, hasn't it? A. Yes, it has.

Q. How long has the Aluminum Company been making pistons like that for Ford? A. Only two or three months, to the best of my knowledge.

Q. Was that before or since they made pistons for Ford like Exhibit 3-J? A. That is since.

Mr. Richey: That is all.

Re-Cross Examination by Mr. Bruninga.

Q. You don't actually know that Ford has adopted that piston Exhibit 76, in production? A. Yes, I know it, practically. I know that the Aluminum Company is making pistons like these by the thousands now.

Q. I am asking you though, now, do you know whether Ford has actually adopted that equipment as standard equipment? A. I haven't seen one put into the engine block, or anything of that sort, no, but the way I gather other information of that sort about the automotive industry, I am practically certain that Exhibit 76 is the 1933 Ford V-8 piston.

Q. But you don't know but what Ford is still experimenting with that piston to determine whether it is going to be the standard piston? A. Yes, he is putting them into the cars that he is selling now; I feel pretty certain of that.

Q. You just know that from hearsay? A. If you want to call it that.

Q. We are just asking for your information and not deductions you might draw from what people tell you or what you see. Now you said that the flexibility varied directly as the length, in other words, if the length of

a part is increased to double the length, it would be double the flexibility? A. That depends on what you mean by the length. If it is the length of the web, then you halve the flexibility, other things being the same. If it is the length of the lever arm, then the flexibility is doubled.

Q. And that varies universally as the cube of the thickness, is that your understanding of the theory of mechanics? A. Yes.

Q. That only applies, however, to a simple beam fastened to one end; isn't that right? A. Oh, that applies to beam structures generally that are solid.

Q. That doesn't apply to a complex structure like the web in Exhibit 1, does it? A. Oh, not exactly; that is very complicated, of course.

Q. Now, you said you have seen pistons like Exhibit 1 without that relief that we have been talking about, that is, the relief in the cylindrical part going from the web to the skirt proper. Did you see those pistons after they had run for a while? A. Yes, I have.

Q. And you found out they were down on these corners? A. That was the point of hardest bearing, yes.

Q. And after a while they were down considerably? A. Yes, they could wear quite a bit. Of course any piston wears as it is used in the motor.

Q. But that was the point of greatest wear, the zone of greatest wear? A. Yes.

Q. And there was considerable pressure applied there, wasn't there, to cause that scuffing off or wear, we might say? A. Well, the piston will wear whether it has any pressure other than the thrust pressures. I don't know of any way to keep a piston from wearing in service.

Q. Yes; but that wear that takes place in those regions we are talking about, that was due to considerable pressure applied in those regions? A. Oh, I don't know as you could say "considerable pressure." It shows that the piston was bearing first and eventually hardest at those points.

Q. And that is the reason that the Ford piston, Exhibit 3-J, is cam-ground to avoid that wearing down, initial wearing down? A. Well, not exactly. The cam-grinding there is done to try to obtain more even bearing pressure against the cylinder wall at all times, and so that the piston can be fitted a little closer when new.

Q. Now, you take then, as the length of the web, the distance where the web part of Exhibit 1 at the top

actually joins the head at the top to the cylindrical part of the skirt; isn't that right—you take that as the length of the web? A. I take that as the length of the flexible portion of the web.

Q. Flexible portion of the web? A. Yes.

Q. That is what you take? A. Yes.

Q. Then, I suppose, in Exhibit 76 you would take it again as way up to almost the slot? A. Yes, that web is cast in also in Exhibit 76.

Q. And that is what you consider the length of the web to be, way up into the skirt part? A. That is the length of the flexible portion of the web at its top, yes, I should say so.

Q. But in the Gulick patent you only take the length of the web as the part 17 on the skirt? A. Oh, I should think so; that seems to be the only place for the web to end there in that casting.

Q. Now, as far as the part on the inside of Exhibit 1, which shows a set-off corresponding to that keystone relief, that is really done for the purpose of having thickness of the metal the same in the casting, isn't it? A. Well, not necessarily for that purpose. That corresponds to the relief in the outside of the casting.

Q. That is common practice in stove-molding, isn't it, where you have an ornamental part on the stove, to fix up the pattern so that the ornamental side is relieved at the back? A. I don't know.

Q. You have never seen a stove casting? A. Well, I don't know that much about stove-molding.

Q. Well, from your knowledge of metallurgy and casting, you would consider, if there was such a relief, it was done to keep the thickness of the metal the same? A. Well, not necessarily to keep it the same; I would say it is probably designed to provide the proper relationship between flexibility and the other features in the piston, with a horizontal slot of a certain kind.

Q. Now, when you talk about wall pressure between a piston and a cylinder, you really mean the pressure per square inch, which is usually expressed in pounds per square inch? A. I don't know how it is expressed. I mean the pressure of the piston as it expands out against the cylinder wall or as it is forced against the cylinder wall.

Q. But in an engine where the piston expands and there is wall pressure, there may be moderate wall pressure on a unit of surface and still be considerable pressure against the whole surface; isn't that right? A.

Well, that depends of course on the bearing area. If you had a very large area of bearing, you could have small unit pressure and fairly large total pressure. Again that is assuming that the pressure is pretty evenly distributed over the whole surface.

Q. Do you know what the permissible pressure per square inch between a cylinder and a piston without causing scuffing off, undue wearing down, is? A. No.

Q. Now, in the Long piston, Exhibit F, you found evidences of wearing off the skirt, didn't you? A. Yes.

Q. And you don't have reason to believe that that piston seized? A. No, I think probably that piston did not seize.

Q. That Ricardo piston, Exhibit 73, is a sand-cast piston, as you know, don't you? A. Yes.

Q. And being a sand-cast piston, that aluminum was rather soft, wasn't it? A. Probably softer than the permanent mold piston.

Q. Quite a lot softer than the permanent mold? A. Yes, I think so. I could verify that, I think, in a moment (strikes two pistons together). Yes, it is somewhat softer than Exhibit 1.

Q. And that would permit the scuffing off and wear, wouldn't it, being softer? A. That would make the elastic limit somewhat less and produce that flow of metal a little easier, certainly.

Q. Now, Mr. Richey calls your attention to Exhibit FFF, and he called your attention to the "W. M. L. Co." and "Magnalite" on one side of the piston. Now on the other side of the piston you see "E. C. Long, Detroit," don't you? A. Yes.

Q. You still believe that this particular piston was sold to Franklin direct by Aluminum Company of America, or Walker M. Levett? A. Oh, I don't know about that particular piston in view of that on the other side of the boss, but the Aluminum Company or Levett certainly sold direct to the Franklin Company.

Q. But do you know that Mr. Long also sold pistons direct from Detroit? A. No, I didn't know that.

Q. And you didn't hear Mr. McCoy say that after Long promised to be good and buy all of his castings from the Aluminum Company or other licensees, that the suit against him was dismissed? A. Well, if I heard it I didn't pay any attention to it.

Q. Do you know what years the Aluminum Company of America sold pistons like that Exhibit FFF to the Franklin Company? A. No, not from the records;

just from my recollection of seeing the castings around the plant. It was, according to my recollection some time from about 1920 to about 1926.

Mr. Bruninga: Re-direct examination closed.

Thereupon, the defendants called as a witness in surrebuttal, George P. Dorris, who, being first duly sworn, testified as follows:

Direct Examination by Mr. Bruninga.

Q. What is your name and age? A. George P. Dorris.

Q. Where do you live? A. St. Louis, Mo.

Q. What has been your general education, just give it very briefly? A. High school and general school in Nashville, Tennessee, one year in Vanderbilt University, and from there on up through the gasoline engine business, up to this time.

Q. What has been your experience, very briefly, in gasoline engines in automobiles? A. I built my second engine between 1890 and '92. That was a motor boat proposition, and that was operated for four or five years, and driven around Nashville and from Nashville to Bowling Green, Kentucky, where it was sold. During that time I had the agency for the Foos Gas Engine Company of Springfield, Ohio, and sold a number of engines in southern Tennessee and northern Alabama to operate cotton gins. I did quite a little contracting work in keeping those engines running, and other engines. I kept in close touch with what was going on in the gasoline engine business and in 1893 John L. French and myself spent two weeks in Machinery Hall at the Chicago Worlds Fair, where we paid particular attention to all the gas engines on exhibition there, which were principally of foreign makes, English, German, French and Swiss. In 1895 there was a road race or motor race of motor cars, or horseless carriages held in Chicago and I began to build a horseless carriage at that time, which I had operating in the summer of 1897. That was run around Nashville up to previous to Thanksgiving of 1898, when it was shipped to St. Louis where the St. Louis Motor Carriage Company was organized, of which I was vice president and chief engineer. They began building motor cars at that time, and from 1900 up, we had been fairly successful in the motor car business. In 1903 the partner there, John French, died from an auto-

mobile accident in Pittsburgh, and in 1905 that company was moved to Peoria, Illinois. I resigned at the time and formed a new company at St. Louis known as the Dorris Motor Car Company, and was vice president and president and engineer of that up to 1927, January. I spent two years with the Sterling Products Corporation as sales engineer from January, 1928, until about January, 1930.

Mr. Richey: Just a minute. This seems like it is going to amount to a good deal more than I thought. I think you ought to make your application for leave to take surrebuttal, so we can have a ruling on that.

Mr. Bruninga: There are several matters which came up, and I have the right to rebut. He is stating his qualifications as briefly as possible.

Mr. Richey: I want to enter a general objection to taking any surrebuttal testimony. It has not been shown there has been any improper rebuttal testimony, or any reason for taking surrebuttal.

The Master: I think you may have your objection, and the question can be raised later.

Mr. Richey: Of course if this is an expert, we put Dr. Jeffries on and we thought when he left you were at the end of the case. You didn't say you were going to put another expert on. I would like an adjournment to tomorrow morning so we can have him here.

Mr. Bruninga: He can read it. I am going to put on that other witness; I agreed to have him put on.

Mr. Richey: All right, then, if it is all right for him to read the testimony, very well.

Mr. Bruninga: Oh, yes, yes.

Mr. Richey: However, I don't withdraw my objection to its being improper surrebuttal testimony.

Mr. Bruninga: If you have any cause to reply to Mr. Dorris, you can do that at any time.

Q. Now, this Dorris Motor Company was the manufacturer of the Dorris automobile, isn't that right? A. Yes.

Q. Can you tell me what class that automobile was in with reference to the Packard and the Cadillac and cars of that kind? A. Well, we ranked with them right along.

Q. Would you say it was successful or not a successful car? A. Yes, successful.

Q. Now, you said you were chief engineer of that company? A. Yes.

Q. Until it stopped business in 1927? A. Yes.

Q. Now, what experience have you had with pistons, and I may say if you had any experience with the making of cast iron pistons? A. Why, I designed everything that we used at that time, because there was very little to follow outside of the older stationary engines that were in use at that time.

Q. Did you have any experience with the making of slipper pistons? A. Yes, comparatively recently—1916-1917.

Q. Did you have any experience with the testing of aluminum pistons? A. Some.

Q. While connected with the Dorris Motor Company? A. Yes.

Q. Going back now prior to the year 1914, including particularly the years 1911 and 1914, what kind of tests were given pistons in those days by the Dorris Motor Company? A. We had the practice at that time of pulling an engine by a previously started up engine for a day's time to work the frictional heat out of it, and the next day that was put under gas and it pulled the next succeeding engine and helped take the friction out of it.

Q. Now, you have heard the expression "block test" used. What is the block test of an engine, and particularly with reference to pistons, and what was it in 1911 and 1914? A. It was a limbering up test and included the measurement of power and other essential details.

Q. Was it the practice to run-in the engine then in those days, in 1911 and '12 before it was put in the chassis? A. Oh, yes, some.

Q. Did you have any actual experience yourself in the testing of pistons as distinguished from running them in, for the years 1911 and 1914? A. I devoted most of my time to the development and progress in the performance of the engines and all the details.

Q. Did that include the testing of pistons? A. It did.

Q. Did you have any occasion to test pistons as to whether they would function properly as distinguished from running them in? A. Oh, yes, various troubles.

Q. I want you to keep your testimony right down to 1911 and 1914. How was the test of a piston conducted in 1911 and 1914 to see if it would function prop-

erly—was it put in an automobile or put out on the road, or stationary? A. We used to put them in stationary, usually load them, let them run a few hours, push them up a little and push them up until they would seize and the troubles would show, and at what speed it would perform. After we had arrived at the particular piston we knew just about how much it would stand, and if that was as good as we had up to that time, that was passed, it was O.K.

Q. Was any particular attention paid to clearance in those days? A. Oh, yes, certainly; that was gauged very accurately.

Q. Now, how much of a test was a piston run before it was determined that it would operate satisfactorily in your opinion? A. Oh, if we were going to make a change from one piston to another, we would give it maybe a week's time before we would make a decision, running every day.

Q. Would that be in a stationary test? A. Practically, yes.

Q. Can you tell me about what equivalent in mileage that would be before you would be satisfied with the correctness of the construction? A. I would say around a thousand miles.

Q. Now, there was such a thing as a road test of an automobile? A. Yes.

Q. Was that road test run to particularly test out whether a piston would operate or endure? A. Partly. Principally to limber up all the chassis bearings.

Q. Now, is a piston like a spring or a wheel or a steering gear on an automobile, that you have to test it on the road before you can determine whether it will operate satisfactorily? A. You can get a better answer from the block test because you could keep the heat on continually. You can't do that on the road.

Q. But you cannot run an automobile while it was standing still and just run the engine if you want to test a new steering gear, can you? A. I didn't quite catch that.

Q. Well, when you want to test a new steering gear? A. Oh, we had to go on the road.

Q. And that is also true of a wheel and a spring, is that right? A. Yes.

Q. But did you find that necessary in order to test out a piston, whether it would seize or endure? A. No.

Q. Were you acquainted with engineers of different automobile companies in those years, 1911 and 1914? A. I knew practically all of them.

Q. Did you belong to any engineering society? A. I have been a member of the S. A. E. since 1910.

Q. Did you find in the years 1911 and 1914 the automotive engineers would test out a piston by giving the car a road test or a block test? A. Some of them made both, usually.

Q. When they gave them a road test, was there something else on the car besides the piston that wanted to be tried out? A. Oh, a number of things always.

Q. As far as principle of operation and construction is concerned, does the block test tell you anything as to principle of operation and endurance and proper clearance of a piston, does the block test tell you what you want to know, or is it necessary to make a road test? A. Very considerable.

Q. The block test does? A. Drive them until they would stick, then see where they would stick and then file them off where they showed high pressure.

Q. Now, you have seen Exhibit 48 in this case, haven't you? A. Yes.

Q. And you have heard Mr. Gulick testify as to a block test on that type piston? A. Yes.

Q. Can you tell me whether the block test would show up, whether the principle of operation and the clearance would be correct on the piston that he testified about? A. I think so.

Q. Do you think it was necessary to run a 3000-mile road test in order to determine whether the piston would stick or whether it had enough clearance? A. No, the block test was much more severe than the road test.

Q. In a block test you could run your engine up to almost any speed on the wide open throttle? A. Yes, sir, continously.

Q. Could you do that with a road test? A. No.

Q. Now, you have heard Mr. Gulick testify about this Exhibit 51, this aluminum piston? A. Yes.

Q. Do you consider that a road test was necessary for that as distinguished from a block test? A. I wouldn't consider it as important.

Q. Would you consider that it was necessary to test that out for 4500 miles?

Mr. Richey: Object to it as leading.

A. I would not.

Q. You found that parts of an automobile break after it has been out in service, haven't you? A. Yes.

Q. Is that always due to defect in principle of operation? A. No, mostly straight breaks, unless the part is inherently weak, in such case that is usually stiffened up.

Q. Now, keeping to the years 1911 and 1914, as I understand it, after an engine was finished it was put on and run in at first stationary, is that right? A. Yes.

Q. You first run the engine to be worked in with another engine, is that right? A. That is correct.

Q. And then you followed that up by taking that engine and let that run another engine? A. That is correct.

Q. And that was followed up by putting that engine in a car, isn't that right? A. Yes.

Q. Now, that was done in regular commercial operation, wasn't it? A. That was the routine.

Q. And what was the purpose of the road test on the cars that were in regular production? A. Check adjustments and help to work the friction out of the engine and other parts.

Q. Now, you were in court yesterday and heard Mr. Schoengarth testify, did you? A. Yes, sir.

Q. And have you read the Schoengarth patent that he testified about? A. Yes.

Q. What have you to say about the practicability of that piston as shown in the patent?

Mr. Bishop: I object to that as not proper surrebuttal. He went into that with Mr. Stillman, and has put in his case on that.

Mr. Brundage: No, I am asking this witness to only testify, not from the patent structure, but from what he heard Mr. Schoengarth testify as to the piston that he constructed, that he said he constructed and operated in 1915.

The Master: Same ruling on that.

A. I don't see anything that would keep it from operating.

Q. In your opinion was the piston that Mr. Schoengarth described and which he said he operated in 1915 practical for use in worn cylinders? A. Yes.

Q. Now, some question came up yesterday in the cross-examination of Mr. Schoengarth as to the clearance, and that he didn't have any micrometers at the time. Do you think it was necessary for him to have a micrometer with the adjustable piston that he had? A. No, the situation is about the same as adjusting a crankshaft bearing or any other bearing.

Q. Did you examine Exhibit 5-K10? A. Some.

Q. Well, do you understand the principle of adjustment? A. I think so.

Q. Do you know how the adjustment works? A. Yes, he has a taper head screw fitted into a tapered hole, which is between or in the vertical slot.

Q. Do you consider that principle of operation practical or impractical? A. That will work.

Q. Now, Mr. Schoengarth also testified yesterday that he had made a piston generally as shown in his patent 1,174,092, without the adjustment and with the slot 4 practically vertical, he filed off at the side, dressed it off above the slot 3, that it was between one and a half and two thousandths oversize, and he put it in a cylinder and ran it. Do you think that operation of fitting such a piston was practical? A. Yes.

Q. As he described it, can you tell me whether or not you would consider a piston like that would function in a cylinder? A. Certainly.

Q. What have you to say about any compensation for expansion in such a piston? A. Why, it has two major functions here: one, the segregation of the skirt from the head, which stops direct transmission of heat to that portion of the skirt adjacent to the slot, which naturally forces more heat to be carried out through the rings and lesser degree of total heat transmitted to the skirt; there is also the vertical slots which permit a greater degree of flexing of the skirt and possibly closer fitting, without danger of seizure.

Q. What would have happened if he had not dressed down the part above the slot 3? A. Why, if you drive it under that condition it would have soon scuffed off.

Q. Why would it scuff off without seizing at the skirt or without seizing at that point? A. The temperature would expand it to a greater degree than the skirt would expand it.

Q. Why wouldn't it seize? A. From the ratio of size here, there wasn't sufficient metal to produce serious seizure.

Q. Do you know that from experience or just from theory? A. Yes, we have had the ring lands seize when they weren't relieved enough.

Q. But how about scuffing off of a narrow part, have you had any experience with that? A. Apparently you can heat that to a higher degree of heat on account of the lack of backing or metal to absorb the heat or friction, so that naturally a metal would soften up

with that temperature. When the piston seizes it really melts the surface of the metal, so the heat must be pretty high, and that produces scuffing.

Q. Mr. Schoengarth discussed the fact that he dressed off the sides of the piston in the region of the wrist pin bosses. Do you know whether that was an absolutely new practice in 1915? A. That was a universal practice from the beginning of the gasoline engine. Unless you did that you had no degree of fit at all.

Q. Did you ever do that? A. Had to do it.

Q. How far back? A. Oh, 1900 and up.

Q. If you ran a piston a while in a cylinder and that relief isn't there, what happens? A. It would indicate where the pressure had become higher. If you continued in pushing that piston to more heat and speed, it would naturally scuff and burn and it would be naturally relieved.

Q. As a mechanic, what has been your practice when you found a part fitted too tight? A. Why, we looked for the part that was carrying the high load, and eased it up, just like scraping a bearing.

Q. Now, as far as Mr. Schoengarth talked about relieving the piston that he put in that Sullivan & Cumbe car just above the slot and below the lowest ring land, and which did not have the adjustment, can you tell me whether that was a new thing to do to make the piston of less diameter below the ring land than the skirt? A. I don't think so.

Q. How old do you know that to be? A. Right from the beginning of the horizontal slotting, the time that was first produced.

Q. Are you familiar with the Howe patent? A. Yes, sir.

Q. When did you become familiar with it? A. In 1911, the oil pumping began to be a serious factor on account of increased engine speed and it became necessary to relieve the piston at that point to let the oil flow back into the cylinder. We got this idea from the Continental Motor Company, and later one of Mr. Howe's relatives was around selling licenses on it and we paid $75.00 for the license on that patent.

Q. Do you know what the practice was among other automobile manufacturers? A. They all accepted that as soon as it became generally known.

Q. How early did your company take a license under the Howe patent? A. About 1911.

Q. Can you tell me whether or not that practice was in use or did it come in later? A. The first we knew of it, it come to us through the Continental Motor Company.

Q. What year was that? A. Oh, it might have been 1910.

Q. Did you notice it in the pistons of any other cars? A. Oh, it appeared fairly generally about the same time.

Q. About 1910 or 1911? A. Yes.

Q. Now, Dr. Jeffries talked about the Franquist piston, both on prima facie and on rebuttal. He talked again on rebuttal and then I cross examined him as you heard. Have you read that Franquist patent? A. Yes.

Q. Have you seen these two exhibits 3-Q and 5-L? A. Yes, sir.

Q. You saw the test that was performed this morning? A. Yes, sir.

Q. From your understanding of that patent, from your examination of these two exhibits and from the test, can you tell me whether the skirt of that piston is flexible or is it stiff, too stiff to operate in an engine? A. It has a degree of flexibility.

Q. What in your opinion about whether it will operate in an automobile engine? A. It will.

Q. Do you think it will compensate for any expansion? A. To some extent.

Q. Are you familiar with pistons of the character of Exhibit 1? A. I am.

Q. Will you compare the Franquist piston and Exhibit 1, particularly as to functioning at the top of the skirt? A. Well, it has this same segregation of skirt from the head, practically identical with the No. 1. It has some internal cast ribs that are slotted, which provides a greater length of metal for the skirt for its diameter. It has a feature here which is not described in the patent, which is workable, and that is radial expansion of the head has a tendency to pull out the boss walls, which would automatically, to some degree, pull in the cross walls or side walls, which would help or assist or work in harmony with the intentional resiliency or flexibility of this piston.

Q. Do you base that on a mere theory or experience? A. I have had experience with similar pistons on that same principle except that it didn't have the grooves, it had greater reliefs on the side, carried around a little farther.

Q. Did you ever test a piston like Exhibit 1? A. Yes.

Q. Did you find it very flexible at the top of the skirt? A. Not very much so.

Q. Do you consider Exhibit 1 more flexible or less flexible than the skirt of the Franquist patent? A. I would—I couldn't say on that positive, but my opinion would be they wouldn't be far apart on that, especially if the Franquist had about the same amount of metal in it as the number 1.

Q. Now, when those slots, when those slots were partially closed this morning by the test that was given them of clamping in the slot, what happened, did it increase or decrease? A. That shortened the circumference and consequently reduced the diameter.

Q. Dr. Jeffries also brought up on prima facie, and again on rebuttal, this Kant Shore piston, Exhibit 3-Z. What do you know about that piston so far as commercial use is concerned?

Mr. Richey: Objected to as improper surrebuttal. You went into that in your case in chief, all that we did was answer you.

The Master: Same ruling.

A. Why, this has a segregation principle.

Q. I am not asking you about the construction, I am asking you what you know about its commercial acceptance? A. Well, it was used, had quite a little use but developed breakage.

Q. Was that piston ever sold by anybody that you know? A. By the H. & H. Manufacturing Company of St. Louis, that were engine service men, sold that piston.

Q. On prima facie and again on rebuttal the question of this relief of Exhibit No. 1, adjacent the thrust faces, was brought out. Have you anything to say about that, based again on experience and not on theory?

Mr. Richey: Same objection.

The Master: Same ruling.

A. Why, this particular design developed localized high pressure spots at these upper corners of the cross head shoe, the one with the split, to such an extent that if that was driven above 60 miles per hour or continuously, those would be scuffed down. If they were relieved, which they were automatically, which was done by wear, the space would be increased. In fact, the drag on that piston was such at 65 miles per hour to limit its speed, and on replacing pistons with less expansion or

tension against the cylinder walls the speed was put up to 75 miles per hour, with change of pistons alone.

Q. You mean with that same piston? A. Well, with other design pistons.

Q. Now, did you look at this Exhibit 73, the Ricardo piston? A. Yes, I noticed that.

Q. If the skirt, particularly the wide part, were slit, do you think the webs of that construction would flex? A. It would.

Q. What have you to say as to the flexure of the top, would there be any flexure at the top of those webs, cut as they are? A. In here?

Q. Yes, would there be any flexure of the webs at the top, cut back as they are, as shown in the Exhibit? A. Well, it would be a little better than the No. 1 exhibit on account of the greater depth of slot at that point.

Q. You heard Dr. Jeffries testify of performing certain tests with the pistons on a bathroom scale by standing on them. Did you ever perform any tests on pistons that way? A. No.

Q. Would you ever think of testing a piston that way? A. We always tried to get a mechanical gauge to tell us the truth.

Q. Do you think that is a fair test of any piston, to stand on it on a bathroom scale? A. I wouldn't accept it.

Q. Do you think it would teach you anything at all? A. Not serious.

Q. Now, the Ford piston, Exhibit 3-J. Do you understand that piston? A. I think so.

Q. Now, assuming that it is slotted, or even that it is not slotted, what is the function of that cam-grinding in there? A. Why, it transfers the contact of the working shoe a further distance from the base of the slot, the horizontal slot, and therefore permits a greater degree of, a very much greater degree of flexibility than in the case of No. 1. In other words, the points where they scuff the most have been removed. There is another feature here, that is a circular wall would be better because it would be hinged a greater distance from the vertical slot, which would permit a greater degree of flexibility with the same degree of flexion in the metal, or the elastic flexion of the metal.

Q. Are you familiar with Defendants' Exhibit 3-O, the Plymouth piston? A. Yes.

Q. Did you find any flexible webs in that piston? A. No, no webs in it.

Q. Are you familiar with the Mooers patent 1,402,309? A. Yes.

Q. Do you consider 3-O a copy of that patent? A. I would not.

Q. Do you see any resemblance between them at all? A. Not from a functional point of view, except the partial segregation and nearly full segregation on that piston.

Q. There is nearly full segregation on the Mooers patent? A. Yes.

Q. And how much segregation do you find on the 3-O? A. Between a third and a half, not far off from a third.

Q. Do you think that little slot of part way gives you much segregation as far as heat transference from the head to the skirt is concerned? A. When almost two-thirds of it is a solid connection; it would be in the ratio of the length of slot from the head to the circumference.

Q. What is the function of the vertical slot in that piston? A. That is to permit an expansion joint to take care of the excess expansion of the skirt on account of the heat that is transmitted from the head to the upper end of the skirt.

Q. Can you see any similarity between the Gulick patent and that piston, assuming you have read the Gulick patent? A. Well, this would be considerable less metal in it.

Q. I mean as far as structure is concerned?

Mr. Richey: Let him answer, now.

A. Yes, the Gulick has a continuous segregation and the heat and the thrust is transmitted through two inner walls, and the skirt is carried by the inner walls. I understand that that skirt is split to take care of circumferential expansion.

Q. Do you find the slot going all the way down on 3-O? A. This does not.

Q. What would you call that slot in 3-O? A. Commonly known as a T-slot.

Q. Do you find such a T-slot in the Gulick patent? A. No.

Q. Do you find any flexible webs at all in 3-O?

Mr. Richey: Oh, he has answered that. Don't lead him so much.

Mr. Bruninga: That is not leading.

A. If you distinguish web from skirt, I would say no.

Q. What I am talking about is these webs 17 and 18 of the Gulick patent structure. Do you find those webs in 3-O? A. No.

Q. The bottom of the skirt of 3-O is solid? A. Yes, sir.

Q. Can you tell me whether that has any effect on the operation of 3-O? A. I think it is very beneficial.

Q. In what way? A. Why, in all pistons the real expansion carries with it the skirt, and where the slot is continuous, it has a tendency to pull apart or open up that slot, which is contrary to what you want to do. In this case the lower edge of the skirt is continuous and prevents any opening up of that part, and on account of its being continuous allows the side walls to move out under the radial expansion which automatically will pull in the cross dimension. The upper end of the skirt where it is adjacent to the head is very much stiffer because of its contact and connection with the head, cannot be made quite so flexible, but by virtue of the T-slot construction the piston is made flexible at the upper end and not so flexible at the lower end, and that is the desirable factor that has been sought for some time.

Q. I believe you said that piston had an expansion joint at the top in the slot? A. It can be considered so.

Q. How long to your knowledge have expansion joints been used to take up for heat, not in pistons, but in things in general? A. Ever since I was old enough to recognize temperature in working with metals.

Q. What would happen if you ran the slot all the way around 3-O, as in the Gulick patent structure; would the head stay on or drop off? A. Well, it would almost be off, if not off it would—in this piston it would be off.

Mr. Bruninga: That is all.

Cross Examination by Mr. Richey.

Q. Are you still employed by the Sterling Products Corporation? A. No.

Q. You have been here throughout the trial, assisting Mr. Bruninga? A. Yes.

Q. Is the Sterling Products Corporation paying you for being here?

Mr. Bruninga: I don't see where that has anything to do with the issues in this case. He can ask if his expenses are paid, but the purpose of counsel is obvious.

Mr. Richey: It is just a matter of prejudice, nothing else.

The Master: I think he may answer to that. You are entitled to ask that of any witness, if he is being paid.

Mr. Bruninga: It is all right to ask him if he is being paid, but not who paid him.

The Master: He may answer.

A. I am here at Mr. Bruninga's request.

Q. That doesn't answer my question. Tell me who is paying you for being here? A. Well, Mr. Bruninga; it may come from Sterling, I don't know.

Q. You have been paid already for some of the time you have spent here, haven't you? A. Yes.

Q. Who paid you for that? A. It was paid me by Sterling.

Q. Sterling Products Corporation? A. Yes.

Q. As a matter of fact, although Mr. Bruninga recommended you to come here, your arrangements were made with the Sterling? A. No.

Q. You didn't talk with anybody from the Sterling Products Corporation about coming here to testify? A. Afterwards it was discussed with Mr. Bruninga. He was the one to say whether he wanted me or not.

Q. Also, with employees or officers of the Sterling Products Corporation?

Mr. Bruninga: I raise an objection again. The witness has already said that.

The Master: I think he has answered that.

Mr. Bruninga: He has answered the question and the rest is for obvious purposes. As a matter of fact, the answer should be stricken out.

The Master: Oh, I think he may answer.

Q. You also talked with officers or employees of the Sterling Products Corporation about coming here and testifying in this case, or about this testimony? A. Oh, after Mr. Bruninga called me up, yes, I went up there to get a couple of exhibits.

Q. Now, this piston, Exhibit 1. Sterling Products Corporation manufactured pistons like that while you were there, didn't they? A. Yes.

Q. What year was that? A. Oh, it might have been 1919, I think.

Q. What year? A. No, no,—1920. It might have been 1929, I know they weren't making that when I first went up there.

Q. Before they finally adopted this piston like Exhibit 1 they tried to market several other different kinds of aluminum pistons, didn't they? A. Yes.

Q. One of those pistons had an iron strut in the head, didn't it?

Mr. Bruninga: Same objection.

The Master: Same ruling; he may answer.

A. Yes.

Q. You tested that piston out, did you? A. Yes.

Q. And you finally gave it up, didn't you? A. No.

Q. You haven't made or sold any of them like it, have you? A. Not for the present that I know of.

Q. Not since you adopted the one like Exhibit 1? A. I can't say. They may have sold some, I don't know.

Q. You recommended that piston to Ford, didn't you? A. Yes.

Q. And they tried it out and gave it up?

Mr. Bruninga: I want to make an objection. It is entirely outside of the direct examination; I don't see it has any bearing.

The Master: Go ahead and answer the question.

A. The reason for them giving it up was price.

Q. Well, they gave it up, that is the question? A. Yes.

Q. Now, the Sterling Products Company also tried pistons with other forms of splitting other than that shown in Exhibit 1 before they adopted Exhibit 1? A. That was some time back in 1925—'22, somewhere in there.

Q. And those were given up either at or prior to the time Exhibit 1 was adopted? A. I don't know what success they had with them in that time. I joined them when they made that Invar insert piston.

Q. Did you know that the Aluminum Company or Aluminum Industries, Inc., or the Bohn Aluminum and Brass Company, or any of them, were making pistons like or substantially like Plaintiffs' Exhibit 1 at the time that Sterling Products Corporation adopted that piston? A. I think so.

Q. Had pistons been made by one or more of those companies before that piston was adopted? A. Yes.

Mr. Bruninga: I would like to continue my objection. This is going into the suit against the Sterling Products Corporation.

The Master: He has testified he worked for them, I assume he can be cross examined on that, as to what they were doing.

Mr. Bruninga: That is outside of the issues of this case.

The Master: I understand so, but the question came up in direct and to a limited extent I will permit it now.

Q. When did the Dorris Motor Car Company go out of business? A. In 1927.

Q. What did they do, go into the hands of a receiver? A. Yes.

Q. Back in 1911 you were using a trunk type iron piston? A. Yes.

Q. That was standard production, wasn't it? A. Yes.

Q. At that time. And the pistons you tested and described here were pistons of that type? A. Yes.

Q. And what you were doing in those tests was taking that standard type of piston in a standard car, that was right, wasn't it? A. Yes.

Q. And even in those days you put the cars on the road and ran them a while, didn't you? A. That was part of the tuning up.

Q. How far did you run the cars in the test? A. From 50 to not more than 150 miles, usually a day's run.

Q. And you run them farther than that now? A. Don't run them at all now.

Q. That is, since the aluminum pistons came in Ford doesn't run all the cars on tests at all, does he? A. Practically not.

Q. You had a regular force for testing Dorris cars back in 1911, didn't you? A. Yes.

Q. Did you have your own car back in those days? A. Yes.

Q. And you sometimes ran the company's cars, didn't you? A. Yes.

Q. Did you sometimes test the new equipment on your car or the company's cars? A. Both ways.

Q. That was quite the common practice, wasn't it? A. Yes.

Q. And you ran it a mileage depending on the character of the device under test, didn't you? A. Oh, not necessarily so. I ran the mileage because some one test demanded, and maybe not all the factors. We tried to couple up as many experiments as we could on one car.

We usually had two experimental cars, one of them going practically all day, someone was driving it.

Q. Before you recommended the use of a new device on your car you would have it thoroughly tested out? A. To the extent it would show it a betterment over what we were using.

Q. You leaned on the side of overtesting rather than undertesting? A. Oh, I don't know; we had more or less serious troubles all the way along with pistons seizing.

Q. What I mean is you would rather run it more miles to show it was good than run it less miles? A. That depended on the time we had to push it, to get them out.

Q. Of course when you were busy you would take a chance on undertesting? A. Yes.

Q. Not being busy you took a chance on overtesting rather than undertesting? A. Put them in and broke them, see what would happen to them, if it was in a car where we wanted to shift.

Q. That was true of all parts of the car, not only pistons but lots of things? A. Yes, whole thing tested out together.

Q. With new equipment you were never satisfied with the standard test to break the equipment in, such as road tests made by new cars reported by your testing department? A. Oh, I don't get you exactly on that. You say satisfied?

Q. What I am getting at is this, that if you were trying out new equipment, something you had never used before, a new device, you were never satisfied with just the kind of test you made on standard devices, were you? A. No, we run tests on two cars, as a rule, before it ever got to production, before we got to a position to try it out in production or not.

Q. You say production. What do you mean by production? A. Every day delivery work.

Q. Operations on a new device up until the time you went into production was testing, wasn't it? A. Yes.

Q. What you have said now about 1911 was true of 1914, wasn't it? A. About the same.

Q. And the practice you have described was pretty general, wasn't it? A. Yes.

Q. Equipment that was employed in an engine was as a rule tested inside and outside both, wasn't it? A. Yes.

Q. The breaking of a piston in a motor is quite a serious matter? A. Not always.

Q. It is difficult to get in there and remove it, isn't it? A. Oh, you have to take the head off and take the pan off to get at it.

Q. Sometimes when the piston breaks it ruins the cylinders, don't it? A. Yes.

Q. Now, before you would adopt a piston as standard equipment, you would have to be satisfied it wasn't going to break in the cylinder? A. We would, if there was a danger of that; we would question that very seriously as to whether it would stand up. And the engineers at that time were prejudiced against slotting the iron pistons, and that is what prevented a bigger showing of slots previous to what has been shown here.

Q. That is, they were afraid of these things? A. The weakening of the structure and afraid of breakage.

Q. So they wouldn't adopt any aluminum piston? A. Not aluminum—iron piston.

Q. I mean any iron piston that wouldn't be practically 100% perfect as far as breakage was concerned? A. Oh, yes, they took a chance on lots of things.

Q. I am asking a question about pistons; answer the question. A. Well, if it showed signs of being a betterment of what was used previously, they would give it their consideration.

Q. But a piston had to be more perfect with respect to lack of danger of breaking than other equipment? A. Oh, yes, it was given a front place in the testing, recognized as one of the vital spots of the engine.

Q. It was recognized for a good many years that the iron piston was too heavy, wasn't it? A. Yes.

Q. And also it wasn't as good a conductor of heat as it should have been? A. Yes, that is true.

Q. And it was known, at least from 1911 on, that aluminum was lighter and a better conductor of heat than iron? A. Yes.

Q. And therefore better material for a piston? A. Yes, and that a sand cast piston was poorer and that was held up for some time because of the lack of better bearing, it scuffed freely.

Q. The sand cast? A. The sand cast, and that delayed progress in that direction.

Q. But even after the permanent mold piston came in, those things were recognized, as I said, about the advantages of a piston? A. Oh, yes.

Q. You talked about the piston shown in the Schoengarth patent. Except for the testimony you heard Mr. Schoengarth give, you never heard of that piston being used commercially, did you? A. No.

Q. Now, if that piston was adjustable and locked with a locking washer or nut, as Mr. Schoengarth said, the piston would not flex in use, would it? A. It would only serve one purpose, that is the adjustment; the same as the adjustment of a bearing; there might be a slight amount of flexibility between the adjustment on account of the slot.

Q. How often is it necessary to adjust a piston? A. Oh, formerly about every 20,000 miles.

Q. Now, this piston 5-K10, except for what you heard Mr. Schoengarth testify, you never heard of that piston having been used commercially? A. No, that is new to me.

Q. And that piston would be rigid and non-flexible when the adjusting means were set, wouldn't it? A. Practically the same as a solid skirt piston.

Q. You don't mean to say there would be any flexibility in that, do you? A. Not in this particular example; depends on wall thickness a good deal. It might be assisted by that slot in some degree with lighter walls.

Q. In other words, if you made the walls so light it couldn't be used as a piston, it might flex? A. Oh, no, it would be the same as that Deluxe piston, 3-H.

Q. Were you familiar with this Franquist piston at the time that you were struggling with that Sterling piston before you adopted pistons like Exhibit 1? A. I was not, but Mr. Flamang and Mr. Bowser possibly were.

Q. And that Franquist piston of course was not adopted by them? A. No.

Q. You said you had an experience with pistons similar to the Franquist piston. Just what piston did you mean when you said that? A. It was a trunk type, continuous skirt piston, of light walls and a big rib between the two bosses, and a very large clearance on each side so that the cross-head shoes were comparatively small. The radial expansion of the head of that piston was sufficient to push the end walls out sufficient to pull in the side walls, so that the application of heat actually reduced the diameter of the cross-head section of the piston.

Q. That was a trunk type piston? A. Trunk type piston and no slots in it at all.

Q. What was the name of that piston? A. They didn't give it any name.

Q. When was that piston? A. Sometime between January, 1928, and January, 1930.

Q. Was this when you were with the Sterling Company? A. Yes.

Q. Did you test that piston out? A. Yes.

Q. In the laboratory? A. Yes—no, in the shop and in the car on the road.

Q. For the Sterling Products Corporation? A. Yes.

Q. They didn't adopt that piston, did they? A. Not as yet.

Q. Well, are they still testing it? A. I don't know.

Q. Were they when you left there? A. I couldn't say.

Q. This Spillman piston you talked about, when did the H. & H. Company discontinue the sale of that piston? A. I don't know. Mr. Charley Marien was the one that had the contract for that piston, and the H. & H. Company—he started the H. & H. Company. They have been in business there in St. Louis for quite a long time.

Q. It has been a good many years ago since they discontinued it? A. Oh, 1917—'18—something like that, maybe before.

Q. Who made them, do you know? A. They were made in Cincinnati.

Q. Well, aren't you a little early on that date? A. Maybe so, I wouldn't be positive about that. Anyway, they were offered to us and I never did try out any of them because we were afraid of the breakage factor on them.

Q. Do you remember what year they were offered to you? A. Oh, it might have been '20 or '22.

Q. Where did they break? A. They would break the wings, the ones we had.

Q. They would first collapse before they would break? A. Oh, yes, yes, they would hammer after they got loose, too loose, they took a permanent set is what led to the breakage.

Q. What do you mean by "hammer"? A. Well, after these had been pushed in by lack of strength enough to resist the thrust, the diameter would become small, and then they would set up a terrific hammering, then they would knock the wings off.

Q. You mean by hammering, they would flap in the engine? A. In the engine, yes, cross hammer from the thrust.

Q. I suppose that was an objectionable thing, that hammering there, wasn't it? A. It sure was.

Q. What had to happen when that happened? A. Maybe you needed a new engine.

Q. Well, at least the pistons had to be removed, didn't they? A. Yes.

Q. And why would they sometimes have to have a new engine? A. Well, it might lead to breaking a connecting rod, and that would wind it up. Get loose in there and the head come off the skirt part.

Q. Punch holes in the crankcase and such things as that? A. Yes, sir.

Q. That is what happens when a piston breaks in an engine sometimes, isn't it? A. Oh, the skirt parts, that might break off and fall out of the way of the revolving crankshaft, it may set up a little noise, but it wouldn't be more serious than the actual breaking of the piston, it would be taken out immediately and the noise would give indication that something was wrong, so naturally it was replaced.

Q. Sometimes that would happen and sometimes what you said would happen when the piston would break? A. All kinds of things would happen.

Q. You spoke of the Ricardo piston and talked about one there. You never knew of that piston being used commercially, did you? A. Oh, I read of it in the English motor papers.

Q. I mean of your own knowledge. A. No, I don't know of anybody adopting it. I believe that car Mr. Pomeroy built, that all-aluminum car, used them.

Q. When was that? A. That was quite a long time ago, when Mr. Pomeroy joined the Aluminum Company, I believe.

Q. You mean he used it experimentally in his car? A. Oh, yes, experimentally. It was discussed through the S. A. E. meetings.

(Thereupon adjournment taken to 9:00 A. M. the following day.

At 9:00 A. M., Friday, March 24, 1933, the hearing was resumed.)

Further Cross Examination by Mr. Richey.

Q. Mr. Dorris, did you keep in touch with piston needs and development of pistons while you were employed with the Dorris Company prior to 1920? A. Yes.

Q. Did you ever try out a trunk type aluminum piston in any of your cars? A. I don't remember a trunk type, but a kind of cross-head type.

Q. That is, it had a solid skirt? A. Solid skirt, but segregated that from the head at the two shoes.

Q. And something like that Ricardo piston? A. Closely to that, not exactly.

Q. What was the result of trying that out? A. Why, they would stick up after it would run, like all pistons; they were both too large and too small at the same time.

Q. As a matter of fact you ran one in a car and had to stop the car and take the pistons out on the road? A. I did that four times.

Q. And tried to get them to fit, didn't you? A. Why, apparently there was no room for so-called fitting to correct the real trouble.

Q. And after that test you continued with the iron piston, didn't you? A. Yes.

Q. Now, after this aluminum piston like the Maynard type came on the market, did your company adopt them? A. No.

Q. You know those pistons were generally used, don't you? A. Yes.

Q. This trunk type slipper piston you said was like the Ricardo that you tested out. When you took it out, changed it and put it back, what did you do to it? A. Oh, there was nothing to do to it. I just got disgusted with it. That was what they called a semi-die cast casting, supplied by one of the Aluminum Companies, either here or Detroit or Manitowoc.

Q. You say they stuck up, you mean would seine? A. Yes, would seine.

Q. Did the other engineers at the Dorris Company know about this? A. Oh, yes, sure.

Q. Did you make any changes in that piston or try to make any changes in it to remedy that? A. Not seriously. We depended on the Aluminum Company to give us something that would work.

Q. When was that, do you remember? A. It might have been around 1918 or 1919; it was after the armistice, I believe.

Q. Did you continue to use the iron piston up until your company went into the hands of a receiver? A. In 1927, yes.

Q. I hand you a drawing. Does that show the iron piston that you used? A. It looks like one of them.

Q. How long did you use the piston shown in that drawing? A. Well, I won't say that identical piston, but some of the pistons, from about 1915 to 1927.

Q. Was it used just as shown in this drawing, machined that way? A. I think so. I don't recognize these (indicating).

Q. You refer to the white figure? A. Yes.

Q. As distinguished from the black one? A. Yes.

Mr. Richey: I offer this in evidence as Plaintiffs' Exhibit 79.

Q. Was this your standard equipment, this piston? A. Yes, sir.

Q. What clearance did you allow with this piston? A. We gauged the pistons with a piece of paper two thousandths thick and two inches wide, so it could be pushed through readily by hand.

Q. What clearance did you allow with the slipper type aluminum piston you said you brought out? A. I don't remember exactly; it was about three and a half, possibly, or maybe nearly twice that.

Q. You said you tested the equipment in your automobile and cars of the company that you drove. What type of driving did you do when making those tests? A. Went out to break them up.

Q. You used them in driving across country on Sundays, all that kind of driving we used to do with our families and friends? A. Not always with the family.

Q. Well, I mean sometimes. You sometimes took out your family, sometimes your friends, sometimes other people? A. The shop car.

Q. What do you mean "shop car"? A. The crew of the company used to go over to the Indianapolis races, back and forth, you see, all the time, and then always four or five from the factory there.

Q. And then you sometimes took other people out beside the shop people, didn't you? A. Yes.

Q. And you rode back and forth to work in the car? A. Yes.

Q. And went on errands for the company and yourself in the car? A. Yes.

Mr. Richey: That is all.

Re-Direct Examination by Mr. Bruninga.

Q. Mr. Dorris, the things Mr. Richey just asked you about, and the try-out of the car, was that for the purpose of just simply testing out the pistons or trying

out of the car? A. No, not entirely. We used it as utility work as well as for experimental.

Q. Take for instance a piston like Exhibit 48, how much of a run would have to be made with a piston like that to show it had the right clearance? I mean out on the road or on the block or any place, or any other way you can think of, how much of a run would have to be made to determine? A. Oh, if that was fit to what we would call a decent running piston to give it a little chance to work the friction out of it, if we would open it up within an hour to get the full heat on it, it would continue to show whether it was going to continue to run or not or whether it will seize.

Q. Do you have to run a piston like that for a month before it would seize?

Mr. Richey: I object as improper re-direct examination; I didn't ask him anything about that on cross examination.

Mr. Bruninga: There was cross examination on the method of testing out.

The Master: Oh, he has already answered.

Q. Can you tell me how long a piston has to be run in order to determine whether it incorporates the right principle; I am just taking as an example one like Exhibit 48 and that is all?

Mr. Richey: That is not proper re-direct examination.

Mr. Bruninga: Well, then, limit it to anything, any new piston.

A. I would say in a day's run you would begin to know something about it, whether it was better or worse.

Q. Have you found in your experience that a material defect, that is a defect in a casting for instance of a piston, will show up right away? A. Not necessarily.

Q. But has that anything to do with its principle of operation? A. No.

Q. Or the clearance? A. That is practically independent of the principle.

Q. Mr. Richey asked you about permitting mechanics or shop men to run cars. Was that particularly to test out pistons? A. Oh, no, for limbering up process.

Q. Now, Mr. Richey asked you whether some present day cars, I believe, weren't run right off of the line without any running in of pistons, and I believe you answered yes. Can you tell me what type cars are run right off the line?

Mr. Richey: I object unless he knows of his own knowledge.

Q. Well, only testify what you know of your own knowledge, and don't guess at anything and don't tell me what you heard others say, or if you have seen things laying around, like Dr. Jeffries did; just tell me what you know of your own knowledge and limit it to that. A. The end of the Ford line in the River Rouge plant, they come right off and are driven right off the end of the line. Now, what happens before they got to that point, I don't know.

Q. How about the Chevrolet? A. I don't know about that.

Q. You don't know about the Chevrolet. The Ford car, is that a high-priced car? A. No, I wouldn't say so.

Q. Do you know any cheaper priced car than the Ford? A. It is about he bottom, pretty close to it.

Q. Do you know whether the Ford Company instructs the customers to run that car right off the bat at 50 miles an hour? A. I don't know what the practice is now but a few years back everybody practically requested that the speed be kept down until the car was limbered up thoroughly.

Q. Do you know about what speed? A. Oh, that varied; some of them said 30-40 miles, something like that; some of them pasted stickers on the windshield with that instruction on it.

Q. Was that after 1926 or before 1926, that was the practice? A. Possibly more before than after.

Q. Now, do you know whether cylinders today are simply ground? A. Well, the process is boring to bring them within a few thousandths of size, and then honed for sizing, and polished.

Q. Was that honing process used in 1911 or 1914? A. No.

Q. Now, Mr. Richey examined you about the Kant Skore piston, Exhibit 3-Z. Did you ever use any of those pistons? A. No.

Q. Did you ever see them tried out in an engine? A. No, I can't say that I saw them in the engine. I saw them after they come out.

Q. Do you know of your own knowledge that the piston that you saw had come out of the engine? A. It had the markings on it that indicated.

Q. Are you finished? A. I can't say that I saw it come out of an engine, no. I wasn't working on it.

Q. Again I want you to testify of your own knowledge and not do what Dr. Jeffries did, what he looked at it, from appearance. What do you know of your own knowledge as to that Kant Skore piston having been broken loose that you saw? A. No, I couldn't say that I took it out myself.

Q. What is that? A. I can't say that I took it out of the engine myself.

Q. You were there, you saw one of them that was broke? A. After it came out.

Q. Well, you saw one of them that was broken, is that right? A. Yes.

Q. Do you know that that had actually been used in an engine? A. I think it was; I suppose so.

Q. I am asking you whether you know now? A. No.

Q. Did you ever see any other broken aluminum pistons in your life besides this Kant Skore piston? A. Oh, I have seen a few, not many.

Q. Have you ever seen any like Exhibit 1 that were broken? A. Yes.

Q. Where did you see any of those pistons broken? A. In the Ford laboratory.

Q. In Detroit? A. Not Detroit, Dearborn.

Q. What year was that? A. About 1928.

Q. Now, Mr. Richey asked you about a piston that you had tested in a Dorris car. Was that exactly like Exhibit 73? A. It was very similar except the shoes went straight out square on the ends, and not drilled.

Q. And you obtained that from Aluminum Company of America? A. We obtained the casting from Aluminum Company.

Q. Did you ever try out a piston like that? A. Not exactly like that, no.

Q. When you say "exactly" what do you mean? A. Oh, size, proportion, this piston.

Mr. Richey: Referring to Exhibit 73.

The Witness: 73.

Q. Your company quit business, then, in 1926, is that right? A. The fall of 1926-27.

Q. Can you tell me whether you ever tried out any pistons like Exhibit 1, the Ford type piston? A. Well, at that time we had learned to get fair service out of the iron piston, and the Aluminum Company wanted $800 for a die to try out that piston.

Q. Did you think much of it by looking at it? A. Well, we really expected something better because we

knew something of the working of that piston some time before.

Q. Now, Mr. Richey asked you about a Sterling piston that I believe had been submitted to Ford Company. I don't know whether it was identified or not, but will you describe that piston? A. With the Invar in it?

Q. Yes. I believe that is the one. A. Yes.

Q. Will you describe how that piston was constructed? A. Through the second ring groove, crosswise—

Mr. Richey: Perhaps I have one.

(Mr. Richey produces piston and hands same to witness.)

A. (Continued) Through the second ring groove, crosswise the pin, a slot approximately 3/32 x 1-1/2 was broached, and a piece of Invar steel inserted and riveted through a boss at the center of the piston head. This steel insert was then sized so that it, with a ring concentrically arranged, would exactly fit the bore of the cylinder without appreciable clearance, that is, inside of a thousandths of an inch. The skirt of the piston was oval and tapered—let me see—you might say a flattened corner, that is, it had a major diameter at the top and bottom crossways of the pin and a minor diameter in line with the pin. The diameter at the bottom of the piston skirt was made anywhere from zero to plus three thousandths larger than the cylinder. That was put in the Ford car and with the polish in the cylinders at that time could be driven at top speed the first mile.

Q. What tests were made at the Ford plant of that piston? A. It was about June, 1928.

Q. What kind of tests were made, and testify of your own knowledge and not what you heard? A. The first test, we delivered a set of pistons and Mr. Shelldrake had them run, and we were told to come back in a few days to see what happened to them. We came back, and the pistons were badly scuffed on one side only, and after lining the pistons the way they come out of the engine, it proved that they were scuffed between number one and number two and between number three and number four. We naturally asked what was the matter with the cylinder block, and Jimmy Smith, the test engineer, said "Well, you needn't be worried about that, if you knew the fight those pistons put up." That was followed by delivering four more sets of pistons with circumferential difference in diameter, in average diameter

of 12, 10, 9 and 8 thousandths. In a week or so we were back there again.

Q. Cut that as briefly as you can. A. And tried out the first set, which, after three trials, having lost the water through breakage of hose and leakage and possibly going without water, the pistons performed up to the equal of what Ford had and they were taken out and examined and pronounced O.K. That was followed in succession with the other three sets of pistons. The third set was put up to 75 miles an hour within about three miles of the plant, that is the laboratory.

Q. Now, do you know whether Ford ever gave any orders for those pistons to Sterling? A. The Sterling people delivered better than 250,000 of those pistons.

Q. Do you know whether those pistons were in competition with any other piston at that time, I mean, as far as utility was concerned? A. Principally No. 1 piston.

Q. And you say 200,000 were delivered? A. There were 250,000.

Q. And what happened then? A. Well, Mr. Jend began to demand reduction in price in place of a contract, and meantime Sterling had submitted him two cuts in the price, and they had continued to demand reduction in price, so the Sterling people thought it would be better to withdraw then than drag along until there was nothing in it.

Q. Now, that looks like a steel insert in the piston. What is that made out of? A. It is about 34% nickel and the balance low carbon steel.

Q. What price is that steel? A. We paid 40¢ a pound for it at that time.

Q. Did that have anything to do with the price of the piston? A. When the Ford Company figured up that, I believe it figured $800 a ton, they said they wouldn't pay that for gold.

Q. And how did that piston stand up in comparison with Exhibit 1, if you know, by any test that you know of? A. Why, we never heard any complaints after the first month or so. We had a little trouble with the rib not holding.

Q. I am asking you how it compared with Exhibit 1? A. It performed better.

Mr. Brumfinga: Will counsel in this case admit that the application for patent on this piston that Mr. Dorris has been talking about is involved in an interference proceeding with an application of Jardine, the applicant of the Jardine patent?

Mr. Bruninga: Will Mr. McCoy admit that he was one of the parties to that interference and he filed an application for patent on subject matter common to the Sterling piston?

Mr. McCoy: I also moved to dissolve, because the subject matter of my application was not shown in your application, and said motion was granted by the Patent Office.

Mr. Bruninga: But Mr. McCoy will admit on account of his being involved in that interference that an application of Mr. Jardine was involved in that interference?

Mr. McCoy: I believe so, on entirely different subject matter from that of either of the other applications, because of the broad scope of the claims in the parent application.

Mr. Bruninga: Will counsel admit that that interference between Jardine and Flamang and Bowser is still pending in the Patent Office?

Mr. McCoy: I don't know about that.

Mr. Richey: I don't know anything about it. If you say so, I will admit it, subject to correction if we find it wrong.

Mr. Bruninga: I will say that the interference is still pending; it is now awaiting the testimony stage.

Mr. Richey: Why do we clutter up our record with this? I don't think it has anything to do with this case.

Mr. Bruninga: You cluttered it up; I am simply telling the Judge what the facts are.

Mr. Richey: Nothing about this interference. I move all these comments about this interference be stricken out as having nothing to do with the case.

The Master: Overruled.

Mr. Bruninga: That is all.

Mr. Richey: I offer in evidence as Plaintiffs' Exhibit 80 the Sterling piston that Mr. Dorris has used in his description of the steel strut piston that he employed.

Mr. Bruninga: I want to make a statement. I want it to appear from the record that Mr. Richey has produced that piston and handed it to Mr. Dorris.

Mr. Richey: That is right.

Mr. Bruninga: I am not saying it is not a Sterling piston, but I haven't examined it carefully enough that I can admit it.

Re-Cross Examination by Mr. Richey.

Q. Were you at the Sterling Products when a piston of this type was sent out? A. Yes.

Q. First? A. No.

Q. What test did Ford apply to this piston to your knowledge? A. Dynamometer and road.

Q. How extensive were the road tests? A. Why, I was in the plant off and on an average of one day a week for some time, and they were running several sets, which of course I didn't know where they went or to what extent they were driven.

Q. They were in test cars being run substantially constant for a week or more at least? A. I understood so.

Q. And did they thereafter continue the tests on other sets of these pistons of the same nature before they adopted them? A. There was five sets altogether that went in for tests that I know of.

Q. How long was it from the time they were first submitted to Ford to the time they were adopted? A. Oh, not more than 30 days.

Q. I mean adopted for production? A. About 30 days.

Q. Now, the fact is that this piston, as you say, was tested out by Ford in this manner and then adopted for production purposes, but the first cars that they were put in were those that were sold in the neighborhood of the Dearborn plant, weren't they? A. Yes.

Q. A lot of the things you testified about in your direct examination were things you had been told, weren't they? A. I rode in the machine and was in on all those tests.

Q. The tests at the Ford? A. Except the first test.

Q. At the Ford plant? A. At the Ford plant.

Q. You were in the car and rode in the test? A. Yes.

Q. So you know they were tested over a great many miles, don't you? A. Oh, we would put in 150 miles a day on some of those cars at top speed.

Q. Well, isn't it a fact that during your examination a lot of things you testified to were things that you had heard? A. There might have been a few.

Q. Now, about this piston 80, the fact is that Ford adopted this to a limited extent—250,000 pistons is a few pistons for the Ford Company, isn't it? A. Yes.

Q. They adopted a few of them and then used them alongside of pistons like Exhibit 1? A. Yes.

Q. And then the use of those like Exhibit 80 was discontinued and Ford continued to use those like Exhibit 1? A. Yes, the best I know.

Q. And this black material in the slot in this Exhibit 80 is carbon deposit, isn't it? A. Yes, shows high temperature.

Q. Notwithstanding the fact that Ford did discontinue this Exhibit 80 you considered that an excellent piston, didn't you? A. I do.

Mr. Richey: That is all.

Mr. Richey: What about this exhibit? That is offered in evidence as Plaintiffs' Exhibit 79.

The Master: You examined about it, yes. Now, the hearings are concluded except as to the testimony of Mr. Garland.

Mr. Bruninga: Charles Garland.

The Master: And you are to either stipulate that or fix the date when that testimony can be heard later, so that all of this mass of material is in, and if you want to fix a time now when Mr. Garland can be here—

Mr. Richey: We have to have an opportunity to answer anything he had, if it is going to be left open, some of these Gulick witnesses that were strayed, we haven't been able to get, we may find one of them in the meantime.

Mr. Bruninga: I understand this is surrebuttal on my part.

Mr. Richey: We haven't closed our rebuttal case yet.

Mr. Bruninga: You haven't closed your case yet?

Mr. McCoy: I will offer in evidence Plaintiffs' Exhibit 81, the docket entry, journal entry of Gulick vs. The Packard Motor Car Company, equity No. 19; Plaintiffs' Exhibit 82 is the Amplex receivership statement of February 6, 1914; Plaintiffs' Exhibit 83 is the Amplex receivership journal entry, September term.

(It was thereupon agreed by and between counsel and the Master that adjournment would be taken to Monday, April 10th, at 9:30 A. M., for the taking of the testimony previously referred to; that plaintiffs' brief shall be filed on Monday the 24th of April, 1933; that defendants shall file their brief two weeks thereafter, and that ten days shall be allowed plaintiffs to file reply brief, after which a time for oral argument would be set.)

By Mr. Richey: We were informed prior to April 10, 1933 by Mr. Bruninga that Mr. Charles Garland, whom the defendants expected to call as a witness on April 10, died prior to that date and we accept Mr. Bruninga's statement as correct; and, further, that that is the reason Mr. Garland has not been called by defendants.

Plaintiff offers in evidence as Plaintiffs' Exhibit 84 the judgment of the Law Examiner in Interference No. 49,576 handed down by him on April 4, 1924.

Plaintiff offers in evidence as Plaintiffs' Exhibit 85 a certified copy of the drawings of the Ray E. Day application for patent, Serial No. 611,698 filed on January 10, 1923.

By Mr. Bruninga: Defendants offer in evidence as Defendants' Exhibit 5-M a list of patents issued to Packard Motor Car Company on applications filed between August 1, 1917 and December 1, 1917.

The plaintiff closes its rebuttal case.

The defendants close their surrebuttal case.

The case is submitted.

REPORT OF WILLIAM B. WOODS, SPECIAL MASTER.

(Filed January 27, 1934.)

[Case No. 4045.]

To the Honorable Paul Jones, S. H. West and Geo. P. Hahn, Judges of the District Court of the United States, for the Northern District of Ohio, Eastern Division:

Pursuant to orders made and entered in each of these causes on September 14, 1932, at a term of this court held in the City of Cleveland, said District, the undersigned, Wm. B. Woods, Special Master in Chancery, has proceeded to take and hear the evidence offered by the respective parties and to report his findings of fact and conclusions of law thereon, along with his recommendations concerning the relief demanded and concerning the final disposition of these causes, to this court; therefore,

I, Wm. B. Woods, as Special Master in said causes, do respectfully report that I have proceeded to investigate the matters so referred to me; that I have been attended by the parties and their respective counsel at my office at 1214 Terminal Tower Building, Cleveland, Ohio; that pursuant to said order I proceeded to hear witnesses and counsel, to receive and consider testimony, affidavits, exhibits, and other proofs heretofore filed herein, to examine and consider pleadings, proofs, briefs, arguments and any and all other matters relating to the questions involved or the issues raised in these causes; that I have ruled upon the admissibility of evidence and have preserved all evidence offered for final ruling thereon by the court; that I have observed such tests and experiments as the parties performed, and all sessions have been held within this District and Division of this court; and that I have heard and considered all proofs and arguments pertinent to the issues of law and fact in these causes. Such hearings have been had, arguments of counsel have been had, briefs of counsel have been filed, together with suggested findings of fact and conclusions of law, and upon consideration of the same I find and report as follows:

PLEADINGS AND ISSUES.

The three suits were consolidated for hearing before the Master and are heard upon the same evidence by stipulation. The three suits were filed October 17, 1931,

and are the conventional patent infringement suits upon five patents, involving questions of title, validity and infringement, and are for an injunction and an accounting.

Plaintiff, The Cleveland Trust Company, is the legal owner of the title to all of the patents in suit except the Maynard patent, as to which it appears to have only a half interest. Chrysler Corporation named as co-plaintiff, is owner of the other half of the Maynard patent and is beyond the jurisdiction of the court, and joined as a party plaintiff without its consent. From the evidence it appears that the Trust Company has an option on Chrysler's interest dated prior to the filing of these suits, so that The Cleveland Trust Company is the only party plaintiff before the court.

Defendants are three local dealers of automobile accessories, who have offered for sale, sold and used the pistons charged to infringe, which were made by the Sterling Products Corporation of St. Louis, Missouri, which company is conducting and paying for the defense of the three suits. The Sterling Products Corporation was named in the Bills of Complaint, but on motion was dismissed and its name expunged.

Five patents are involved with a total of eighty-one claims, of which some fifty-two claims are alleged to be infringed. At the outset, only two devices were involved, i.e. a Sterling piston and a Ray Day piston, but as the trial progressed the number of devices claimed to be involved was increased to seven, five Sterling pistons and two Ray Day pistons. The name of the manufacturer, "Sterling" and "Ray Day" are used for convenience.

The subject matter of the patents "relates to pistons" for internal combustion engines as each patent recites, and the following are the patents upon which plaintiff relies:

No.	*Patentee*	*Granted*	*Application*	*Filed*
1,815,733	Gulick	July 21, 1931	204,661	Nov. 30, 1917
1,763,523	Jardine	June 10, 1930	364,997	Mar. 11, 1920
1,655,968	Maynard	Jan. 10, 1928	434,467	Jan. 3, 1921
1,256,265	Schmiedeknecht	Feb. 12, 1918	180,511	July 14, 1917
1,402,309	Moores	Jan. 3, 1922	172,380	June 2, 1917

In each cause the pleadings comprise the bill of complaint and the answer, and there are bills of particulars and several stipulations filed in each cause.

None of the patents in suit have been adjudicated by a District Court, although the applications, particu-

larly of the Gulick patent, have been interference in the Patent Office. A consent decree was also entered in one case involving the Gulick patent.

The Cleveland Trust Company, as trustee, has granted licenses under the patents in suit and pistons involving the inventions of these patents have been made, sold and used in large quantities. A great part of the pistons sold are claimed to be actual or substantial duplicates of the pistons of the Maynard patent. Large sums in royalties have been paid to the trustee under the patents, and these causes seem to be the first real test of the patents.

As was said by Mr. Justice Bradley in *Railway Co. v. Sayles*, 97 U. S. 554 (1878) at p. 556: "The evidence in the case is very voluminous, especially in reference to the question of priority of invention, and would be well calculated to present questions of much embarrassment upon the validity of the patent."

Of a similar situation in the recent aluminum molding case where there were also five patents with 29 claims involved, while here 51 claims of five patents are urged to be infringed, in *Aluminum Company of America v. Sterling Products*, 66 F. (2d) 958 (1933), the Court of Appeals of the 8th Circuit affirmed the Eastern District Court of Missouri and quoted Judge Faris, the trial judge of the District Court, who had said: "The confusing and unnecessary verbosity and prolixity of the patents, the wide range of defenses, the size of the record and the length of the briefs have rendered the case unnecessarily difficult and confusing."

PISTONS, SUBJECT MATTER OF THE SUIT.

The inventions relate to pistons for internal combustion engines. These should be as light as possible and in accordance with accepted construction, pistons are hollow cylinders, closed at one end and open at the other, a connecting rod being secured interiorly by means of a transverse pin. Bearings for the pin are the bosses which project inwardly from the side walls of the piston. The objects of the inventions are to provide a piston which will not expand against the cylinder wall to such an extent as to seize or stick, and at the same time there must be provision for lubrication. A successful and efficient piston is one which prevents the pumping of oil and the freezing due to excessive expansion.

In the present state of the art, pistons are constructed with the head or the cylindrical ring portion having a relatively large clearance with reference to the diameter of the cylinder and a skirt portion more closely fitting the same, which holds the piston in proper alignment and prevents slapping. Pistons must also be so constructed that the oil cannot creep past the skirt and drop back into the cylinder, which results in the formation of carbon.

The difficulty to be overcome is to get a proper fit, for if the piston is of sufficient size to fit the cylinder properly while at maximum temperature, gas and oil will leak by when the piston is cool, as at the starting of the engine. There is also the problem of providing a piston of minimum weight with maximum structural strength.

Large numbers of the pistons are in constant use in automobiles, and one piston is required for each cylinder. Formerly cast iron pistons were generally used and there was little difficulty because of expansion. With the advent of aluminum, making possible a lighter weight piston, a new problem was introduced because of the difference in the coefficients of expansion.

CLAIMS OF PATENTS CHARGED TO BE INFRINGED.

The plaintiff selects to exemplify the inventions of the patents and as the basis of the charge of infringement some 52 claims, so many that the setting of them out in full is omitted. The claims of each patent as applicable to each piston exhibit are of the following claim numbers:

Exhibit CCC (Defendants') Chevrolet "4" Piston.

Gulick Patent, Claims 1, 13, 15, 18, 22, 27, 28, 29, 30, 33, 35, 36, 37, 38, 41, 42 and 43.
Jardine Patent Claims 1, 8 and 10.
Maynard Patent, Claim 6.
Mooers Patent, Claims 3, 4 and 11.

Exhibit BBB (Defendants') Chevrolet "6" Piston.

Gulick Patent, Claims 1, 13, 15, 18, 22, 27, 28, 29, 30, 33, 35, 36, 37, 38, 41, 42 and 43.
Jardine Patent Claims 1, 8 and 10.
Maynard Patent, Claim 6.
Mooers Patent, Claims 1, 2, 3, 4, 6, 10 and 11.

Exhibit 1 (Plaintiff's) Sterling Piston.

Gulick Patent, Claims 1, 11, 12, 13, 15, 18, 30, 33, 35, 38, 41, 42 and 43.
Jardine Patent, Claims 1, 2, 4, 5, 6, 7, 8, 9, 10 and 11.
Maynard Patent, Claims 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11.
Mooers Patent, Claims 1, 2, 6 and 10.
Schmiedeknecht, Claims 1 and 3.

Exhibit 3-J (Defendants') Ford "8" Piston.

Gulick Patent, Claims 1, 4, 15, 25, 28, 33, 34, 36, 42 and 43.

Exhibit 3-O (Defendants') Plymouth Piston.

Gulick Patent, Claims 1, 4, 15, 25, 33, 36, 42 and 43,
Mooers Patent, Claims 3, 4 and 11.

Exhibit 8 (Plaintiff's) Ray Day Piston, Split.

Gulick Patent, Claims 1, 15, 22, 27, 28, 29, 30, 33, 36, 37, 38, 42 and 43.
Jardine Patent, Claim 1.
Mooers Patent, Claims 3, 4, 8 and 11.

Exhibit 9 (Plaintiff's) Ray Day Piston, Unsplit.

Mooers Patent, Claims 3, 4, 8 and 11.

FINDINGS OF FACT.

(1) That The Cleveland Trust Company, plaintiff, is and was at the time the suits were brought, a corporation of and a citizen and resident of the State of Ohio, having its principal place of business at Cleveland, Ohio, in this District, as alleged in the Bill of Complaint.

(2) That Chrysler Corporation, plaintiff, is and was at the time the suits were brought, a corporation of and a citizen and resident of the State of Michigan, having its principal place of business at Detroit, Michigan, as alleged in the Bill of Complaint, and is not now and was not, at the time suit was brought, within the jurisdiction of this court.

(3) That Sterling Products Corporation is a Missouri corporation, a non-resident of this District and has not been served with process in any of the above-entitled causes, and that the naming of Sterling Products Corporation has heretofore been stricken from the Bills herein by order of this District Court.

(4) That The Schriber-Schroth Company, defendant in Case No. 4045, is and was at the time the suits were brought, a corporation of and a citizen and resident of the State of Ohio and it has and had a regular and established place of business at Cleveland, Ohio, as alleged in the Bill of Complaint.

(5) That The Aberdeen Motor Supply Company, defendant in Case No. 4046, is and was at the time the suits were brought, a corporation of and a citizen and resident of the State of Ohio and it has and had a regular and established place of business at Cleveland, Ohio, as alleged in the Bill of Complaint.

(6) That The F. E. Rowe Sales Company, defendant in Case No. 4047, is and was at the time the suits were brought, a corporation of and a citizen and resident of the State of Ohio, and it has and had a regular and established place of business at Akron, Ohio, as alleged in the Bill of Complaint.

(7) That Sterling Products Corporation was named a defendant in the Bill of Complaint in each of the suits here combined but it has filed no answers; however, its counsel did petition to appear specially to object to any jurisdiction over it in any of these cases, which leave was granted heretofore by the District Court.

(8) That there is no evidence in these causes showing that Sterling Products Corporation has entered its appearance in any of them; or that Sterling Products Corporation controlled the proceedings in these causes to the exclusion of any or all of the defendants, The Schriber-Schroth Co., The Aderdeen Motor Supply Co., or The F. E. Rowe Sales Co.; but that the respective defendants named herein have controlled the proceedings in these causes.

(9) That The Aluminum Company of America has been granted a non-exclusive license under the patents in suit; Bohn Aluminum & Brass Corporation has been granted a non-exclusive license under the patents in suit; and Aluminum Industries, Inc., (formerly The Kant-Skore Piston Company) has been granted a non-exclusive license under the patents in suit.

(10) That Chrysler Corporation holds title to an undivided one-half interest in the Maynard patent in suit and was requested to join in suits as a party plaintiff against Sterling Products Corporation or its customers, and refused, but was not asked to join in any of these particular suits.

(11) That the piston of the Gulick patent embodies the fundamental structure of the Franquist patent No. 1,153,902 and that the piston of the Franquist patent is operative to substantially compensate for expansion; that the piston of the Gulick patent employs essentially the webs of the Spillman & Mooers patent 1,092,870 and of the Chenard & Walcker French patent 468,595 and that the piston of the Spillman & Mooers and of the Chenard & Walcker patents are operative; that the web construction of the Gulick patent differentiates from those of Spillman & Mooers and Chenard & Walcker simply in matter of design involving mechanical skill; and that splitting of the skirts of the Franquist, Spillman & Mooers and Chenard & Walcker patents by through slotting was within the purview of one skilled in the art.

(12) That by admissions of plaintiff's witness, Gulick, Gulick abandoned and had in public use in this country during the year 1911, a piston exemplified by Ex. 48, and during the year 1914, a piston exemplified by Ex. 51; and that by admission of plaintiff's counsel, both pistons embody the subject matter of claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 42 and 43 and Ex. 51 additionally of claim 38.

(13) That the subject matter of claims in issue in addition to claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 38, 42 and 43 differentiates from the Gulick 1911 and 1914 pistons by matters involving mechanical skill.

(14) That the Gulick specification while pending in the Patent Office was broadened beyond the original disclosure while pistons were produced, used and sold by the following parties:

Elmer C. Long
Gustave C. Monckmeier
Walter L. Schoengarth
Albert L. Spillman
Kant-Skore Mfg. Co.
Steven D. Hartog
Frank Jardine
Aluminum Company of America
Howard E. Maynard
Maxwell Motor Co.
Ray Day
William E. Venner

(15) That after the filing of the Gulick application, his application was materially modified, both as to the specification and claims without warrant therefor in the original disclosure.

(16) That the Gulick patent does not describe in sufficient detail to enable one skilled in the art to reproduce the same, the length and thickness of the webs required to secure flexibility.

(17) That the Jardine patent embodies the fundamental structure of Franquist patent No. 1,153,902, that it employs essentially the slipper piston structure of the Ricardo patent No. 1,294,833, and that the splitting of the slippers of the Ricardo patent was within the purview of one skilled in the art.

(18) That the Jardine patent piston differs from the piston of the Long patent 1,872,772 in matters involving mere mechanical skill.

(19) That the Jardine patent piston differs from the piston of the Gulick patent in matters involving mere mechanical skill.

(20) That the Jardine patent does not describe in sufficient detail to enable one skilled in the art to reproduce the same, the length and thickness of the webs required to secure flexibility.

(21) The Maynard patent embodies the fundamental structure of the Franquist patent No. 1,153,902, and that the splitting of the skirt by through and through slotting was within the purview of one skilled in the art.

(22) That the Maynard patent piston differs from the piston of the Jardine patent 1,763,523 in matters involving mere mechanical skill.

(23) That the Maynard patent piston differs from the piston of the Long patent 1,395,441 in matters involving mere mechanical skill.

(24) That the Maynard patent piston differs from the piston of the Gulick patent in matters involving mere mechanical skill.

(25) That the Maynard patent piston differs from the piston of the Schmiedeknecht patent in matters involving mere mechanical skill.

(26) That the Maynard patent piston differs from the piston of the Ricardo patent 1,294,883 in matters involving mere mechanical skill.

(27) That the Maynard patent piston differs from the piston of the Hives patent 140,998 in matters involving mere mechanical skill.

(28) That the Mooers patent embodies the fundamental structure of the Franquist patent No. 1,153,902,

and that the employment of narrow connectors was within the purview of one skilled in the art.

(29) That the Mooers patent piston differs from the piston of the Spillman & Mooers patent No. 1,092,870, in suit in matters involving mere mechanical skill.

(30) That the Mooers patent piston differs from the piston of the Chenard & Walcker patent No. 468,595 in matters involving mere mechanical skill.

(31) That the Mooers patent piston differs from the piston of the Gulick 1911 and 1914 pistons (Exs. 48 and 51) in matters involving mere mechanical skill.

(32) That after the filing of the Mooers application, his application was materially modified both as to specification and claims without warrant therefor in the original disclosure.

(33) That the Schmiedeknecht patent involves the fundamental structure of the Franquist patent No. 1,153,902 or of any trunk piston; that it employs essentially the construction and arrangement of webs and mounting of wrist pin bosses of the Pugh British patent 17,256 of 1907 and the arrangement of the webs of the Ferry British patent 12,772 of 1914; and that the construction of the Schmiedeknecht patent differs from those of Pugh and Ferry patents and from a trunk piston in matters of design involving mere mechanical skill.

(34) That by admissions of plaintiff's witness Gulick he conceived a piston like Exhibit 51 in 1908, but that nothing was done except making sketches until May 1911; that a set of pistons having the construction and mode of operation of Ex. 48 was given a block test in a motorcycle engine in this country in May 1911 and then scrapped; that another set like Ex. 48 was given another block test in an automobile engine for 24 hours in July 1911 and scrapped; that another set of pistons like Ex. 48 was placed in an automobile engine in July 1911 and the engine operated to run in the pistons; that the engine with those pistons was then placed in an automobile belonging to his company and given a road test in July and August, 1911 and that the pistons operated successfully; that thereafter the automobile was used with those pistons in it from July to November, 1911, and scrapped; that each of these tests satisfied Gulick as to the utility of the mode of slotting of those pistons; and that Gulick alleged in his preliminary statement before the Patent Office that the road test in July and

August 1911 was one in which the pistons in said engine were first successfully operated. That no further experimenting was done by Gulick with pistons until May 1914 when he proceeded with the preparation of drawings of a construction like that shown in the application and in July with the construction of the piston of aluminum like Ex. 51; that such piston like Ex. 51 was not given a block test for the reason given by Gulick that he was satisfied with the previous tests as to the success of the slotting; that a set of these pistons like Ex. 51 was placed in an Amplex car, his own property, and the car driven by himself over 5,000 miles from July 16, to November 11, 1914, when the pistons were taken out and permitted to go into the scrap pile and disposed of but that Gulick made no serious effort to regain these pistons. That the test of the 1911 and 1914 pistons was not concealed, but known to various parties and that the automobiles in which they were placed were used like any other automobile, the 1911 car for business of his company and in his own business and in the 1914 car for his personal business.

That in 1911 or 1912 he took a drawing like that of the patent to one Offield, a patent lawyer, and left it with him until 1912 or 1913 when he took it to one Pond, another patent lawyer; that Gulick was not financially embarrassed from 1911 to 1917 sufficiently not to make application for a patent but that in 1913 he raised $600 to put into the Amplex Company and in that period he filed an application on a motor and another application in 1916. That there was no question about the title of the application of the patent in suit being in Gulick. That Packard Motor Company, the intervening titleholder of the application of the patent in suit obtained an option in March, 1916, which was exercised about August, 1917. That neither Gulick nor Packard made any effort to file an application between March, 1916, and November 30, 1917 and that Packard Motor Company, between August 1 and November 16, 1917, filed a number of applications, at least twelve of which were for other than aircraft and motors for aircraft. That no effort was made to place the embodiments of the 1911 and 1914 pistons in the application of the Gulick patent; that no drawing of either was retained; that neither the 1911 nor 1914 pistons were disclosed to Milton Tibbetts, Patent Attorney of Packard Motor Co.; that the 1914 piston did not come to light until November 8, 1922 when Gulick made the sketch, Ex. 33, bearing that date at Cleveland

in preparation for interference and that Gulick did not at that time tell anything about the 1911 piston.

(35) That the Monckmeier pistons, Exs. 3-V and 3-W, were in use by Gustave C. Monckmeier in this country in his automobile for more than two years prior to the Gulick application for patent; that such pistons embodied a T-slot disposed intermediate the wrist pin bosses with the horizontal of the T below the bottom ring land and with the vertical of the T intermediate the bosses; that such T-slotting functioned to compensate for expansion; that any reduction in head diameter to the horizontal slot involved mere mechanical skill; that such use of the Monckmeier pistons more than two years prior to the application of the Gulick patent in suit was open and not in secret but known to others and in fact public; and that the testimony of Monckmeier and his corroborating witnesses is reasonably satisfactory and reliable.

(36) That for more than two years prior to the application of the patent in suit, Walter L. Schoengarth made and sold at Ironwood, Michigan, pistons of the construction shown and described in the Schoengarth patent 1,174,092 but omitting the adjusting device; that such pistons functioned to compensate for expansion; that any reduction of head diameter to circumferential slot was a matter within the purview of a skilled mechanic; and that the Schoengarth pistons were publicly used and sold in this country more than two years prior to Gulick's application for patent. That for more than two years prior to the application of the patent in suit, Walter L. Schoengarth made and sold at Ironwood, Michigan, pistons of the construction shown and described in the Schoengarth patent 1,174,092. That the testimony of Schoengarth is reasonably corroborated, satisfactory and reliable. That the omission of the adjusting devices is within the purview of any skilled mechanic.

(37) That one Elmer C. Long, in March, 1916 exhibited to Louis Stellman and William Venner at Syracuse, New York, a six slotted piston of the construction shown by Exs. Y and A respectively. That six slotted pistons of the construction shown in Exhibit A and also in Exhibit F were sold by Long to Venner while Venner was at South Bend, Indiana, as early as 1917, and that during the year, 1917, Venner sold such pistons as replacements in Franklin automobiles; and

that Venner continued to sell such pistons furnished him by Long and of the construction shown in Exs. E, F and G from 1918 to 1926. That a piston of the construction shown in the Long patent 1,395,441 with a T-slot was tested at Franklin Automobile Co., at Syracuse, New York, July, 1918 as admitted by plaintiff's witness, Burns. That during the year 1918, Elmer C. Long manufactured and sold six-slotted pistons of the construction shown in Exs. E, F, G and R for replacement in automobiles and that such pistons were actually used during the year, 1918 in automobiles; that Long continued the manufacture and sale of such pistons during the year 1919, until the latter part of that year when the manufacture of the same for replacement purposes was sold to one Weems in Quincy, Illinois; and that Weems continued the manufacture and sale of pistons of the construction shown in Exs. E, F, G and R from the latter part of 1919 to 1930, and that the manufacture and sale of such pistons was thereafter then continued by Chadwick. That in March, 1919, a piston of the construction shown in Ex. F was tested by Franklin Automobile Company at Syracuse, New York, and that on the same date a royalty agreement was entered into between Long and Franklin; that as early as April, 1920, Franklin Automobile Company actually furnished such pistons (Ex. F) for servicing of automobiles for replacement purposes; that as early as November 11, 1920, Franklin Automobile Company used such pistons like Ex. E in production as standard equipment; and that Long pistons of the construction of Exs. E, F, G and FFF were used by Franklin Automobile Company in servicing and regular production until 1926. That the Long pistons of 1917-1926 were successful pistons and from 1917 to 1922 were the only commercial pistons which automatically compensated for expansion. That on January 29, 1920, one Gunn, an engineer of Packard Motor Company, then assignee of the application of the Gulick patent in suit described and illustrated the Long piston in "Automotive Industries" of that date (Ex. D-4) and that Packard Motor Company had notice of the Long piston on that date. That as early as July 7, 1921, Weems, then manufacturing and selling Long pistons of the construction shown in Exs. E, F, G and R advertised such pistons in the "Motor Age" of that date (Ex. U). That as early as December 28, 1921, Elmer C. Long, advertised the Long piston of the construction shown in Ex. FFF in "Motor World" of that date (Ex. 5-C).

(38) That defendants' pistons, Ex. 1, BBB, CCC, 3-J, 3-O and 8 do not embody the structure, function and mode of operation of the Gulick patent in suit.

(39) That defendants' pistons, Exs. 1, BBB, CCC and 8 do not embody the structure, function and mode of operation of the Jardine patent in suit.

(40) That defendants' pistons, Exs. 1, BBB, CCC do not embody the structure, function and mode of operation of the Maynard patent in suit.

(41) That defendants' pistons, Exs. 1, BBB, CCC, 3-O, 8 and 9 do not embody the structure, function and mode of operation of the Mooers patent in suit.

(42) That defendants' piston, Ex. 1 does not embody the structure, function and mode of operation of the Schmiedeknecht patent in suit.

(43) That the Gulick patent in suit describes a piston structure in which flexible webs extend from the wrist pin bosses to the skirt and are surrounded by the skirt; that the prior art requires restriction of the patent to the employment of webs which are of sufficient length and thinness to permit flexing of these webs at the top of the skirt; that Ex. 1 does not employ such characteristic webs; that Ex. 8 does not employ such characteristic webs; and that Exs. BBB, CCC, 3-J and 3-O employ no webs at all.

(44) That the Jardine patent in suit describes a piston structure in which flexible webs extend from the wrist pin bosses to the slippers; that the prior art requires restriction of the patent to the employment of webs which are of sufficient lengths and thinness to permit flexing of these webs at the top of the skirt; that Ex. 1 does not embody such characteristic webs; that Ex. 8 does not employ such characteristic webs; and that Exs. BBB and CCC employ no webs at all.

(45) That the Maynard patent in suit describes a piston structure in which automatic compensation is not secured unless the groove E is cut into the webs F sufficiently and beyond the inside of the piston head flange to secure web extensions at the top of sufficient length and thinness to permit flexing of these web extensions at the top of the skirt; that Ex. 1 does not employ such characteristic webs; and that Exs. BBB and CCC employ no webs at all.

(46) That the Mooers patent in suit describes a piston structure having narrow connectors of restricted

cross sections extending from the head flange to the top of the skirt; that the prior art requires such a restriction; that in Exs. 1, BBB, CCC, 3-O, 8 and 9 the connectors are heavy and not of a structure as described in the Mooers patent and that in Exs. 8 and 9 the connectors are from the head to the wrist pin bosses.

(47) That the Schmiedeknecht patent describes a piston structure in which each boss is supported at its ends, with one end of the boss supported from the head and the other end of the boss supported from the web; that the claims in issue are so restricted and must be so restricted by the prior art; and that in Ex. 1 each wrist pin boss is supported intermediate its ends on the web and not as described and claimed in the Schmiedeknecht patent.

(48) That in Ex. 1 automatic compensation is accomplished by what has been termed the "Keystone relief" and not by any web flexibility at the top; that the circumferential slotting terminates at about the inside of the head flange and that such a construction and arrangement does not secure the operation contemplated by the Gulick, Jardine and Maynard patents.

(49) That Ex. 8 relies upon compensation, particularly at the top by twisting of the connectors from the head to the wrist pin bosses and that such construction and arrangement does not secure the mode of operation contemplated by the Gulick and Jardine patents.

(50) That Exs. BBB, CCC, 3-J and 3-O do not employ any webs connecting the head with the skirt and, therefore, no webs of such flexibility as contemplated by the Gulick, Jardine and even Maynard patents, if the latter has such webs having such characteristics.

(51) That defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O, 8 and 9 employ the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent No. 1,153,902 and Exs. 8 and 9, also the Chenard & Walcker French patent No. 468,595.

CONCLUSIONS OF LAW.

(1) That The Cleveland Trust Company holds the entire right, title and interest to all of the patents in suit, except the Maynard patent, and as to this patent it holds an undivided one-half of the entire right, title and interest, all as trustee of an expressed trust created by plaintiff's Ex. 26.

(2) That under Equity Rule 37 The Cleveland Trust Company may sue in its own name without joining with it any of the beneficiaries under the expressed trust created by plaintiff's Ex. 26.

(3) That at the time suits were brought, the Aluminum Company of America held, and it now holds, a non-exclusive license from The Cleveland Trust Company under all of the patents in suit.

(4) That the Aluminum Company of America is not a necessary party to these suits.

(5) That Chrysler Corporation is, and was at the time these suits were brought, an indispensable party to the suits and, being outside the jurisdiction of this court, and having refused to voluntarily join as a party plaintiff, it was properly joined as a co-plaintiff without its consent.

(6) That this court has jurisdiction of the several defendants in the three suits, viz., The Schriber-Schroth Co., The Aberdeen Motor Supply Co. and The F. E. Rowe Sales Co.

(7) That this court has no jurisdiction of Sterling Products Corporation, a Missouri corporation.

(8) That this court has no jurisdiction nor power to enter any memorandum or declaratory judgment in the above-entitled causes that said Sterling Products Corporation is estopped by the doctrine of *res adjudicata* in any other suit involving the plaintiffs in the above entitled cause and said Sterling Products Corporation.

(9) That plaintiff, The Cleveland Trust Company, was entitled to acquire the patents in suit.

(10) That by stipulation these three suits were tried together, it being agreed that the evidence adduced in any one of the three causes would be used in any one of the other causes with the same force and effect as if adduced in the cause in which it is used.

(11) That the Gulick patent is invalid and void as to all claims in issue.

(12) That the Gulick patent is invalid and void as to all claims in issue for want of invention.

(13) That the Gulick patent is invalid and void as to claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 38, 42 and 43, because (a) of abandonment—at large—by Gulick and plaintiff and intervening privities in title, and (b) of

public use by Gulick in this country for more than two years prior to his application for patent.

(14) That the Gulick patent is invalid and void as to all claims in issue, additional to those recited in conclusion 13, (a) for want of invention over the pistons abandoned by Gulick and plaintiffs and intervening privities in title for want of invention, and (b) over the pistons in public use by Gulick more than two years prior to his application for patent.

(15) That the Gulick patent is destroyed and invalid in toto, because (a) of the attempt to broaden the original application as against intervening rights, (b) of material changes in the specification and claims after filing, and (c) of failure to describe and claim as required by R. S. Sec. 4888.

(16) That the Gulick patent is invalid and void as to claims 1, 4, 15, 25, 27, 28, 34, 36, 38, 42 and 43, because (a) the subject matter thereof was in public use in this country by Gustave C. Monckmeier more than two years prior to Gulick's application for patent, and (b) the subject matter thereof was in public use and on sale in this country by Walter L. Schoengarth more than two years prior to Gulick's application for patent.

(17) That the Gulick patent is invalid and void as to all claims in issue additional to those recited in conclusion 16, for want of invention over pistons (a) in public use in this country by Gustave C. Monckmeier more than two years prior to Gulick's application for patent, and (b) in public use and on sale in this country by Walter L. Schoengarth more than two years prior to Gulick's application for patent.

(18) That the Jardine patent is invalid and void as to all claims in issue.

(19) That the Jardine patent is invalid and void as to all claims in issue for want of invention over the prior art.

(20) That the Jardine patent is invalid as to all claims in issue because of failure to describe and claim as required by R. S. Sec. 4888.

(21) That the Maynard patent is invalid and void as to all claims in issue.

(22) That the Maynard patent is invalid and void as to all claims in issue for want of invention over the prior art.

(23) That the Maynard patent is invalid as to all claims in issue because of failure to describe and claim as required by R. S. Sec. 4888.

(24) That the Mooers patent is invalid and void as to all claims in issue.

(25) That the Mooers patent is invalid and void as to all claims in issue for want of invention over the prior art.

(26) That the Mooers patent is destroyed and invalid in toto because (a) of the attempt to broaden the original application as against intervening rights, (b) of material changes in the specification and claims after filing, and (c) of failure to describe and claim as required by R. S. Sec. 4888.

(27) That the Schmiedeknecht patent is invalid and void as to all claims in issue.

(28) That the Schmiedeknecht patent is invalid and void as to all claims in issue for want of invention over the prior art.

(29) That the Gulick 1911 piston, Ex. 48 was abandoned to the public by Gulick, plaintiff and intervening privities in title.

(30) That the Gulick 1914 piston, Ex. 51 was abandoned to the public by Gulick, plaintiff and intervening privities in title.

(31) That the Gulick 1911 piston, Ex. 48, was in public use in this country by Gulick for more than two years prior to his application for patent.

(32) That the Gulick 1914 piston, Ex. 51, was in public use in this country by Gulick for more than two years prior to his application for patent.

(33) That the Monckmeier pistons, Exs. 3-V and 3-W, were in public use in this country for more than two years prior to Gulick's application for patent.

(34) That the piston disclosure in the Schoengarth patent 1,174,092 was in public use and on sale in this country for more than two years prior to Gulick's application for patent.

(35) That a piston of the construction disclosed in the Schoengarth patent 1,174,092, but without the adjusting devices, was in public use and on sale in this country for more than two years prior to Gulick's application for patent.

(36) That the sale and use of pistons and activities in the production and development of pistons by the following parties constitute adverse and intervening rights as against Gulick, plaintiff and intervening privities in title of the Gulick patent in suit, Elmer C. Long, Gustave C. Monckmeier, Walter L. Schoengarth, Albert L. Spillman and Kant-Skore Mfg. Co., Stephen D. Hartog, Frank Jardine and Aluminum Company of America, Howard E. Maynard and Maxwell Motor Co., Ray Day, William E. Vanner, W. K. Weems and Charles Chadwick.

(37) That defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O and 8 do not infringe the Gulick patent in suit.

(38) That defendants' pistons, Exs. 1, BBB, CCC, and 8 do not infringe the Jardine patent in suit.

(39) That defendants' pistons, Exs. 1, BBB and CCC do not infringe the Maynard patent in suit.

(40) That defendants' pistons, Exs. 1, BBB, CCC, 3-O, 8 and 9 do not infringe the Mooers patent in suit.

(41) That defendants' piston, Ex. 1, does not infringe the Schmiedeknecht patent in suit.

(42) That prior art not cited in the answer may be used to show want of invention, particularly as to use of expedients.

(43) That prior art not cited in the answer may be used to restrict claims of patents in suit.

(44) That plaintiff is not entitled to the relief prayed for in the Bills of Complaint, or any part thereof.

(45) That said Bills of Complaint be dismissed.

(46) That defendants have and recover against the plaintiff the costs of suit.

MEMORANDUM.

PARTIES, JURISDICTION, TITLE AND JOINDER.

Chrysler Corporation as Party Plaintiff.

At the outset defendants raise two questions which concern parties, jurisdiction, title and joinder. In each suit the defense is made (1) that there is a defect of parties, since Chrysler Corporation is a joint owner of the Maynard patent, and (2) that the Aluminum Company of America is a necessary party defendant.

The Bill of Complaint alleges that plaintiff, The Cleveland Trust Company, is the owner of an undivided one-half interest in the Maynard patent, and that the

other one-half is owned by Chrysler Corporation which is beyond the jurisdiction of this court. Plaintiff contends that it has fulfilled the requirements of the law by pleading that Chrysler Corporation has been asked to join in the suit, has refused and is therefore joined as a party plaintiff without its consent. Defendant says that a previous refusal of Chrysler Corporation to join in a suit under the Maynard patent is not justification for a joinder in this case without first having obtained its consent.

Plaintiff relies upon *Independent Wireless Telegraph Co. v. Radio Corporation of America*, 269 U. S. 459 (1926), which defendant attempts to distinguish on the facts as here presented. The defense is raised in defendants' answers, paragraphs 12 and 23, and is applicable only as to the Maynard patent. The record shows that plaintiff has an option, Ex. B-5, whereby upon payment of $1.00 the other one-half can be secured. No cases have been cited in the Patent Law where a patent owner has attempted to enforce the patent by joining the other co-owner without his consent, although there are many cases in the general law as appears from defendants' citations.

In the *Independent Wireless case*, Radio Corporation had obtained an exclusive license under the DeForest patents, except for a personal, non-exclusive, non-transferable license in the DeForest Radio Telephone & Telegraph Company, and DeForest also held legal title to the patents. The DeForest Company was asked to join as a party plaintiff and refused, and was thereupon joined by the Radio Corporation without its consent as a party plaintiff. The Supreme Court held that under the circumstances an exclusive licensee was justified in joining the owner of the legal title to the patents without its consent. While Mr. Chief Justice Taft said at p. 468:

> "The presence of the owner of the patent as a party is indispensable not only to give jurisdiction under the patent laws but also, in most cases, to enable the alleged infringer to respond in one action to all claims of infringement for his act, and thus either to defeat all claims in the one action, or by satisfying one adverse decree to bar all subsequent actions."

and when it came to deciding the case then before the court it was held that the making of the DeForest Com-

pany a party plaintiff was sufficient, for he further said at p. 473:

> "The objection by the defendant that the name of the owner of the patent is used as a plaintiff in this suit without authority is met by the obligation the owner is under to allow the use of his name and title to protect all lawful exclusive licensees and sub-licensees against infringers, and by the application of the maxim that equity regards that as done which ought to be done."

Thus, the assignment of the one-half interest from Chrysler Corporation to the plaintiff set up a strong fiduciary relation between the parties as to the Maynard patent, as did the license in the *Wireless case* and the obligation was on the Chrysler Corporation as co-owner not to defeat the rights which it had agreed to assign or to detract from them in any way.

The Cleveland Trust Company is here proceeding to protect its licensees and sub-licensees under the one-half interest in the Maynard patent which has been assigned to it. In *Collins v. Hupp Motor Car Corporation*, 22 F. (2d) 27 (1927), the Court of Appeals of the 6th Circuit followed the Supreme Court's ruling in *Independent Wireless v. Radio Corporation, supra*, and Judge Knappen said, pp. 30 and 31, of the legal title of the plaintiff to the patent there in suit "It did not escape being an exclusive license merely because it was for an undivided beneficial interest in the patent, and although limited to the automobile manufacturers' trade," and went on to say that "Blackmore held the title to the patent in trust for Collins as well as for himself, and upon plain principles of equity was under obligation to allow his name to be used in proceedings to redress the joint grievance."

While the rule of Patent Law is that patent monopolies cannot be broken up into several monopolies and all be effective in the same territorial limits, *Gayler v. Wilder*, 10 Howard 477 (1850), this is not such a case as will warrant denying relief to the plaintiff on this ground.

ALUMINUM COMPANY OF AMERICA AS PARTY PLAINTIFF.

Prior to April, 1924, The Cleveland Trust Company had good title to the Mooers and Gulick patents and at that time gave a license to the Aluminum Company of America to make aluminum pistons under the Mooers

and Gulick patents. Plaintiff says that thereby was created a non-exclusive license, so that the Aluminum Company is neither a proper nor an indispensable party to this proceeding. Defendant says that the license to the Aluminum Company was exclusive, being on everything except pistons made entirely of cast iron or steel, and since this case involves aluminum pistons only, it is in effect an exclusive license as pertains to aluminum pistons.

Defendant likewise claims as to the Schmiedeknecht patent which was acquired at a later date, and defendant contends that the plaintiff's title as to the Jardine and Maynard patents is weaker even than that of the Gulick and Mooers patents. As to Jardine and Maynard, defendant claims the Aluminum Company is more than an exclusive licensee, and that under the decisions the plaintiff did not secure legal title to those patents.

Defendant asserts that in April, 1924, by the assignment, Ex. 38-B, paragraph 22, the Aluminum Company agreed to assign to the Trust Company all its patents or applications relating to pistons which it then owned or should acquire, thus including Jardine and one-half interest in Maynard, yet in the same instrument where it agreed to "assign," the Aluminum Company reserved to itself the exclusive license to make, use and sell aluminum pistons.

There is much argument in the briefs as to whether Aluminum Company of America is an "exclusive" licensee or a "sole" licensee. It is urged upon the authority of the *Six Wheel Corp. v. Sterling Motor Truck Corp.*, 50 F. (2d) 568 (1931), that The Cleveland Trust Company in this case does not even possess a license to grant licenses, the claim being that its title is less than the title found insufficient by the Court of Appeals of the 9th Circuit in the *Six Wheel case*. Further, the claim is made by defendants that the plaintiff is not entitled to the recoveries of profits or damages as sought in the Bill and that by failing to join the owner of beneficial interests in the patents plaintiff has lost whatever right it might have to the recovery of profits or damages.

The answer to these contentions is found in Equity Rule 37 which reads in part as follows:

> "Every action shall be prosecuted in the name of the real party in interest, but an executor, administrator, guardian, trustee of an express trust, a party with whom or in whose name a contract has

been made for the benefit of another, or a party expressly authorized by statute, may sue in his own name without joining with him the party for whose benefit the action is brought * * *."

If the testimony shows that The Cleveland Trust Company is trustee of an express trust and holds title to the patents in suit as part of the trust "property" or estate (pts. Ex. 26), under this Equity Rule the trustee would be entitled to maintain this action in its own name without joining with it the party for whose benefit the action is brought, if the facts warrant such a finding.

Examining the record, it appears that the trust estate consists of 4512½ shares, of which the Aluminum Company of America holds 1100 shares (Tr. Perfler, p. 271). Thus is disposed of in this suit at least, the interesting question as to whether or not The Cleveland Trust Company, in bringing these suits, should have joined the owner of the beneficial interests in the patents. However, The Cleveland Trust Company may be suing either as a trustee of an estate or in its own right. Under the Equity Rule "the trustee of an express trust * * * may sue in his own name without joining with him the party for whose benefit the action is brought."

In another case recently heard by the Master, *Cleveland Tractor Co. v. International Harvester*, Equity No. 3860, a similarly interesting question as to joinder of the licensor and the licensee was raised, and it was there deemed unnecessary to be determined, in view of the other findings in the case. This case presents a different situation because of the trust relationship of the parties, which seems to furnish a sufficient reason for denying defendant's claims that there has been a misjoinder because of failure to make the Aluminum Company of America a party plaintiff.

Venue as to Sterling Products Corporation.

Sterling Products Corporation was named as a defendant in each Bill, and on motion was dismissed therefrom, there being no evidence that Sterling Products Corporation entered its appearance or that Sterling Products Corporation controlled the proceedings to the exclusion of any or all of the defendants. Plaintiff sought to secure jurisdiction of Sterling, apparently to obtain a declaratory judgment affecting Sterling. The Master heard the evidence on the question of its appearance in these causes, and finds that there is no ap-

pearance, and having no power to recommend a declaratory judgment, the evidence on this subject should be expunged from the record as no appearance is made out.

The situation as to Sterling Products Corporation in this case is controlled by the decision in *The Cleveland Trust Co. v. Simmons Mfg. Co., et al.*, Equity No. 3510, where the same question was presented, and his Honor, Judge Jones, held that no decree could be entered against Sterling Products Corporation in the entry of March 11, 1932, which was affirmed by the Court of Appeals of the 6th Circuit in 66 F. (2d) 134, on June 29, 1933.

CLAIMS AND DEFENSES.

The first and principal defense is that the pistons made by defendants are in the Public Domain and free and open for the public to use. If this be true, defendants have not infringed any statutory rights of plaintiff. The questions of infringement and validity are interwoven in these suits, notwithstanding plaintiff's effort to keep them separate, and this is true for plaintiff relied upon 5 patents with 51 claims directed at the 7 accused devices of defendants.

Defendants contend that no claim of any of the patents in suit, however broad it may be, can be construed to cover any of the devices; in fact, if any such claim does or can be read upon any of the devices, such claim is invalid as beyond the statutory grant of the patent. Since defendants assert that their pistons are within the Public Domain and they cannot be excluded from making them wholly or partly or selling or using them, our first task is to examine the accused devices.

The evidence offered as to the prior art in this case is to be first considered in examining the disclosures of the several patents. As to the record, there is little dispute as to dates. The controversy is principally as to what the evidence discloses to "any person skilled in the art or science to which it appertains or to which it is most closely connected." The patent statute (R. S. 4888) uses that expression as applying to the required disclosure as a pre-requisite to a patent grant, and the same applies to the sufficiency of any prior patent or printed publication.

The expert witnesses called are Dr. Zay Jeffries, Engineer of The Aluminum Company of America, for plaintiff, and for defendants, Louis M. Stellman, former Engineer of The H. H. Franklin Automobile Company,

and George P. Dorris of Dorris Motor Company, all of whom are skilled in the art and whose views are entitled to weight.

Particularly is the history of piston development pertinent in considering these patents for plaintiff's claims of invention are for combinations of old elements alleged to perform a useful function for the first time, *Expanded Metal v. Bradford*, 214 U. S. 366 (1909); and for which plaintiffs claim that it is no answer to such a patent, to say that any or all of the elements are old. *Wisconsin v. Hirschy*, 28 F. (2d) 838, 841 (8 C. A. 1928).

How this situation as to combinations arises in this case is particularly shown by the plaintiff's claim that the Gulick invention illustrated in the patent employs webs in combination with other parts of the pistons and horizontal and vertical slots; and that flexibility results both in the sections of the thrust face adjacent to the vertical slots and in the webs.

The plain trunk piston as it existed prior to the pistons in suit is first to be considered. From the evidence it appears that the trunk piston is still used, for General Motors cars use nothing but cast iron trunk pistons and only in trucks use aluminum trunk pistons.

Pistons Charged to Infringe.

Defendants' pistons consist of two sets represented by 7 accused devices, viz: Set 1, being Exs. 1, BBB, CCC, 3-J and 3-O, known in this case as the Sterling pistons, and Set 2, being Exs. 8 and 9, known in this case as Ray Day pistons.

Set 1—Sterling Pistons are claimed by defendants to be trunk pistons with the application of such expedients as were long known in the art as applicable to such pistons; that the specific devices had been shown and described in patents and publications prior to the alleged inventions more than two years before the applications of any patent in suit; and which pistons had been abandoned to the public and as to which plaintiff is now estopped to lay any claim against the public generally, including these defendants; of these, defendants further assert that

Exhibit CCC is the ordinary trunk piston with the old wrist pin bosses, internal ribs from head to boss, and with reliefs in old circumferential slots, each extending a little over a quarter around the piston, the head is of reduced diameter, which reduction extends below the

lowest ring land as was usual and ancient, to permit oil entrance or exit from the cylinder wall of the interior of the piston; and the skirt is split on one side from bottom to top slot, forming a T-slot in one bearing face which was likewise old.

Exhibit BBB differs from CCC only in that the reliefs in the region of the wrist pin bosses are deeper and cut rather than molded therein, and the circumferential slots are cut in a lathe and not sawed, so that the slots are continued past the old internal ribs from the head to the wrist pin bosses.

Exhibit 1 differs from BBB in that the reliefs have been made still deeper, the sides have been dashed-in and made flat, leaving holes at the bottom of the skirt, like happens if a tin can is smashed in; the dashed-in formation produced a stiff piston, being a truss construction with a chord spanning an arc, and when this piston scored, resort was had to what is now known as the "Keystone relief."

Exhibit 3-J differs from CCC in that the circumferential slot is in the lowest ring groove.

Exhibit 3-O differs from 3-J in that relief is secured by the method of making the skirt oval or elliptical, with a long diameter or a major axis at the thrust faces, and with a short diameter or minor axis along the wrist pin bosses; the circumferential slot is in the lower ring groove only on one side and extending a little over one-fourth of the circumference; the vertical slot does not extend to the bottom of the skirt and stops one-third of the way up.

Set 3—Ray Day Pistons are substantially alike except that in Ex. 9 the vertical slot has not been completed but is intended to be by sawing by a mechanic before installation; skirt is supported from the head by lugs, one on each side extending from the head to the boss as shown in the old Chenard & Walcker patent; except that the piston skirt is not described as split; and flexing is not a necessary factor, for in these Ray Day pistons the skirt is strengthened by a series of annular ribs on the inside.

TRUNK PISTONS AND EXPEDIENTS.

The ordinary trunk piston in use for more than thirty years consists of the piston proper carrying the rings and the cross-head combined in one, so as to pro-

vide what is now called the head and skirt. It has wrist pin bosses projecting from the side walls of the skirt, which are perforated so that a wrist pin may be passed therethrough from which a connecting rod may operate between the bosses. The trunk piston is strengthened interiorly by webs located and formed in various designs. The head carrying the ring grooves was smaller at the ring lands than the skirt, for being the hottest parts, it would expand more than the skirt. The ring grooves receive piston rings now universally split to permit them to expand and contract in order to seal the cylinder, while the skirt itself has a sliding engagement within the cylinder wall.

To this structure of the trunk piston expedients were added before the patents in suit. Relief in the region of the wrist pin bosses was provided for the skirt and this varied in accordance with the conditions encountered or the wish of the designer. The depth of the relief varies from what is necessary in the cast iron piston as shown by the exhibits to the deep relief of the Lynite piston or the extreme relief of the Ferry piston or of the slipper piston of the Ricardo patent.

Relief has also been obtained by "oval grinding," i.e. by grinding the piston skirt oval throughout the entire length, which practice was shown by exhibits and noted by the experts.

Another expedient was to run a groove around the skirt just below the lowest ring land to prevent creeping of the oil upwardly past the piston rings, and this groove was perforated to permit the oil to flow through the piston back into the crank case.

An addition to this last expedient was practiced in the reduction of the diameter of the lower ring land to permit it to wipe the oil down into the groove, thus preventing its passing upwardly into the combustion chamber where it might form carbon. This expedient was shown in the Howe patent and described by Stellman as used by Franklin before any of the patents in suit.

Another expedient, instead of a groove with holes, was the lengthening of the holes to make a more or less continuous slot or slots so that they extended more or less all the way around the skirt. Several prior patents show this, the slot forming a dividing line between the diametrically reduced head and the skirt. In three of the Long patents he reduced the part beneath the lowest ring land to the circumferential slot, and Schoengarth did the same. The circumferential slot isolates the part

below the slot from the part above the slot, which separation Franquist is partial to—to about 1/0 degrees, and in others complete through 360 degrees, while in the Ricardo slipper piston the slippers are completely isolated from the head.

The useful function of the slot or insulating gap is to separate the head from the skirt, thus permitting the skirt to run cooler than formerly, and was described as early as 1902 in the Ebbs patent, being repeated in Spillman & Mooers, Chenard & Walcker, and recently in Ricardo. The progressive history of this separation of head from skirt starts with Ebbs 1902, making the connection to the skirt about midway of its length; Spillman & Mooers make the connection at the bottom; Chenard & Walcker through the wrist pin bosses; Franquist at the top by slotting the piston for one-half of the circumference; and Ricardo separating the slippers circumferentially from the head by connecting the webs just below the top of the slipper and at the bottom, somewhat above the lower termini of the slippers. The three Long patents make the connection in the first like Franquist and in the second and third like Ebbs and Ricardo. Thus the extent of the separation of head from skirt circumferential and the mode of its connection has varied back and forth from 1902 to 1919.

While the skirt slides in the cylinder, the problem is to conduct the heat from the head, which depends upon the connection or isolation of the head and skirt, and the skirt is subject to expansion. No problem was involved in the use of a cast iron piston since there was no difference in the co-efficients of expansion. With the introduction of aluminum pistons with the high co-efficient of aluminum as compared with cast iron, it was either necessary to allow such clearance as to result in extreme looseness and piston slap when the engine was cold, or split the piston as was done with the piston ring. The difficulty was met in the same way as in piston rings which, when subjected to heat, must still maintain their spring engagement and this was accomplished by wholly or partially cutting through the skirt wall.

Defendants contend that the entire problem was met in the Franquist patent, although the same result is claimed to be shown by the split skirts of Ebbs, Van Bever, Rainforth and Serex. Splitting of the skirt became so common that the Patent Office took the position that this was not invention in any particular piston, and refused a patent therefor (Law Examiner's Decision,

Exs. 4-C to 4-F). Another expedient in cast iron pistons particularly, was to lighten the skirt which was accomplished in several ways, as cutting holes in the skirt or even cutting out a part of the skirt in the region of the wrist pin bosses. The experts noted this practice shown in Spillman & Mooers, Ferry and slipper pistons of White and Ricardo, where the slipper is perforated and even the sides of the skirt cut away.

Defendants contend that these expedients were natural developments within the skill of the calling, and were actually in practice before the advent of the devices of the patents in suit, and the further claim of the defendants is that in the accused devices and even in the structure shown in the patents in suit there is merely an incorporation, more or less, of such expedients in a single trunk piston; and that each expedient performs the same function as it did before the natural production of a better piston. Defendants rely upon such rule followed by the courts, as to a stove in *Thatcher Heating Co. v. Burtis*, 121 U. S. 286 (1887); a heating stove in *Hailes v. Van Wormer*, 20 Wall. 353 (1873); storage case of *Office Specialty Mfg. Co. v. Fenton*, 174 U. S. 492 (1899); and the concrete mixing and conveying device in *Powers-Kennedy v. Concrete Co.*, 282 U. S. 175 (1930).

THE EXPIRED FRANQUIST PATENT.

The Franquist patent is relied upon by defendants, who claim Franquist gathered everything of the prior art which his claims describe in combination. The specification of this patent is brief, less than two pages, and seems to be the clearest description of conditions encountered, fundamental means to meet those conditions, operation and result, of the many patents and printed publications before the court. Its brevity and conciseness stand out in contrast with the voluminous specifications of the patents in suit and the professional dissertations of experts.

Defendants claim that the Franquist specification aptly describes the conditions, fundamental means to meet those conditions, operation and result of the Sterling pistons, and that all the patents (except Schmiedeknecht) illustrate the specific Franquist embodiment, so that there is no infringement. The clarity of the Franquist patent No. 1,153,902 is seen in the clauses as to objects and purposes, p. 1, lines 9-25:

"This invention relates to internal combustion engines and has for its primary object the provision of a piston which will eliminate the piston clatter at all speeds and temperatures of the motor.

"With this object in view, the invention consists of a piston having a sleeve which is circumferentially compressible and is adapted to have a snug sliding fit in the cylinder when cold, so that upon an expansion of the piston its sleeve will automatically yield sufficiently to prevent the piston from sticking in the cylinder, and after the cylinder has also expanded will again automatically resume substantially its normal size and take up the free play between the cylinder and piston, which would otherwise occur."

Defendants claim that this language clearly defines the objects and purposes of Sterling pistons and Ray Day pistons, and that in the view of plaintiff's expert it is also true of the Gulick, Jardine and Maynard patents. In the Franquist patent the word "sleeve" is used instead of skirt, to apply to the same part. While brief, the defendant contends the claims of the Franquist patent are fundamental, that they read upon and comprehend all of the accused devices, and that this plaintiff has so heretofore contended as to Ex. 1 in the *Simmons case*.

Plaintiff relied upon the Franquist patent in the *Simmons case*, having acquired title thereto on May 16, 1924, when the patent still had some eight years to run. Plaintiff thereafter included the Franquist patent in licenses, Ex. 39-C, List A, and royalties were collected from the various licensees under this Franquist patent.

The piston in question in the *Simmons case* was a duplicate of Ex. 1 in this case, and it was there claimed to infringe Franquist and other patents in the *Simmons case*. The Gulick patent issued July 21, 1931, and the interlocutory decree in the *Simmons case* was entered September 25, 1931, decreeing the validity of the Franquist patent and infringement by duplicate of Ex. 1 in this case, and thereafter followed the injunction on November 5, 1931.

The testimony of plaintiff's expert as to the Franquist piston and its value developed an interesting situation. Dr. Jeffries said, Tr. 207, that he tested the Franquist model piston and discovered it worked no differently than Ex. 1 without a slot, and was a trunk piston.

This discovery by test the Doctor made the day before the decree in the *Simmons case* was entered, but he did not report this fact to counsel who at the same time were attempting to extend the order of injunction (including Franquist) to Sterling. This effort to include Sterling in that case was denied by the District Court and affirmed in the Court of Appeals. Thus, within two months after the new patent issues to Gulick, notwithstanding a suit is filed charging infringement of Franquist, an order of injunction entered, the expert (and plaintiff must be charged with such knowledge) suddenly discovers that the Franquist patent was nothing at all, although it had been a basis of the decree in the *Simmons case*.

Defendants urge that comparison of the Franquist and the Sterling pistons shows identity of structure, function and mode of operation. The claim is that Ex. CCC is only different from Franquist in that there is one slot; that the circumferential slot of Franquist is in the lowest ring groove, while in Ex. CCC it is just below the lowest ring land, but there is no distinction in this because in Ex. 3-J and Ex. 3-O the slots are located as in Franquist.

Ex. 3-J has the circumferential slotting in the lowest ring groove and in addition has a Keystone relief in the thrust faces forming the so-called Keystone relief not involved in this case, of which more will be said at another place. Ex. 3-O has a circumferential slot in the ring groove; the vertical slot is not completed but terminates one-third of the way from the top of the piston, like Franquist in this respect and having equivalent reliefs extending the full length of the skirt in the region of the wrist pin bosses.

The contention of defendants is that the Sterling pistons approach so closely to Franquist in fundamentals that even in details there is no difference. Whatever difference there is resides in expedients old in the art; the only new thing added being the Keystone relief which is not involved here, and the sole distinction being that instead of one vertical slot, there are four slots or gutters in Franquist.

As to mode of operation, defendants say the Sterling piston is the same as the Franquist, each having a head separated from the skirt in the region of the thrust faces by circumferential slots defining the line of division between a diametrically reduced head, relief in the region

of the wrist pin bosses which, upon heating the reliefs compensate for expansion, and with slots closing to compensate for the expansion. Notwithstanding the grant of the Franquist patent, whether expired or unexpired, having all presumptions of validity in its favor, plaintiff's expert asserts that Franquist is an ordinary trunk piston lacking flexibility to function different from a trunk piston, and this in spite of the fact that the specification says that the structure is flexible.

Plaintiff points out that Franquist employs four gutters where the patents in suit and the accused devices employ only one slot. Question then arises whether the gutters permit the expansion and contraction of the skirt as does the slotting of the skirt. While Franquist causes contraction of his piston by what he calls circumferential compression, plaintiff claims that this is not sufficient for successful operation of the Franquist piston, although the testimony lacks the evidence of any motor tests establishing this contention. The application of a can opener device (defendants' Ex. 3-I) showed that by pressure of the hand the gutters would be closed sufficiently to hold a coin, which would drop out when the hand pressure was released.

Notwithstanding the pendency of the Simmons suit, the expert testified (Tr. 205) that "the Franquist piston principle so far as I know is not used at all in pistons at the present time," and (Tr. 204) that "the construction of the Maynard piston is different from that of Franquist; its mode of operation is different and its result is different," and this testimony is given at the same time that plaintiff and witness Jeffries claimed that Ex. 1 and also Exs. RRR and CCC employed the Maynard principle. Such contention is at variance with the position taken by plaintiff and those through whom plaintiff claims. By reason thereof, defendants contend that plaintiff is not only estopped by taking these positions against these defendants, but is wholly estopped from questioning the utility of the Franquist piston or that it embodies the structure, function and mode of operation of Ex. 1, as well as of the other accused devices.

ESTOPPEL OF PLAINTIFF TO DENY UTILITY OF FRANQUIST.

Defendants urge that since plaintiff has used the Franquist patent as a basis for this trustee to keep licensees in the fold, and is disowned as it expires, that

thereby arises an equitable estoppel. Having abandoned the expired patent, the plaintiff now seeks to perpetuate its monopoly, relying upon another, the newly issued Gulick patent. Defendants urge that if there is no estoppel, then a third patent might issue after the fourteen years had elapsed, replace Gulick, and the monopoly thus be perpetuated indefinitely. As an answer to such practice defendants urge an equitable estoppel in favor of defendants, a presumption of operativeness and utility of a patent structure conclusive against plaintiff, and that the question is one of utility.

A case in point of like "quite unusual circumstances" is *Dalton Adding Mach. Co. v. Rockford Milling Mach. Co.*, 253 Fed. 189 (DC Ill., 1918), where plaintiff owned the Helmick patent set up in defense, and marketed machines under that patent, and the court said:

> "The plaintiffs thereby held out the patent to the public as a valid patent, and gave warning to the public and to any possible competitors that they asserted and claimed a monopoly under that patent."

In that case plaintiff brought suit against another for infringement of the Helmick patent, and on issue of the Hopkins patent involved in the then pending case, the suit on the Helmick patent was voluntarily dismissed. Judge Sanborn further said that the facts did not, strictly speaking, there create an equitable estoppel in favor of defendants, since they were not in the same business and were not misled by plaintiff's acts, yet the facts did strengthen the presumption of inoperativeness, placing the plaintiff in inconsistent positions.

In the case at bar, not only are the parties in the same business, but plaintiff was prosecuting the Simmons suit, including its claims on Franquist, at the time of the trial in this case. An authority relied upon in the *Dalton case, supra, Rice-Stix Dry Goods Co. v. Scriven Co.*, 165 Fed. 639 (C. C. A. 8, 1908), was where plaintiff had sold a structure covered by a Brown patent under trademark and contended the trademark had not expired because the patent was invalid. Judge Hunger says, p. 645:

> "* * * Having derived, through the assertion of the validity of the Brown patent, all the advantages incident to the possession of a valid patent, it will not now be heard to assert the contrary, as a means of escaping consequences arising upon the termination of the monopoly secured through the patent. This is based upon the well-recognized rule that:

'Equity will refuse to aid a complainant in cases of this character, who is himself guilty of making material false statements in connection with the property he seeks to protect.' *Hilson v. Foster*, 80 Fed. 896."

And further, p. 646:

"It matters not that complainant may have supposed the Brown patent to have been a valid one."

PRESUMPTION OF OPERATIVENESS.

With the grant of a patent as provided in Revised Statutes 4886, there arises a presumption not only that the patent is valid, but that its structure is practically operative. Otherwise, the grant of a patent by the government would be a vain thing, and there is the further presumption that the expert examiners in the Patent Office have examined the structure for operativeness. Such rule applies to a patent in suit and also to any prior patent advanced as a reference in an infringement suit. Such was the view of Mr. Justice Roberts in *Powers-Kennedy Co. v. Concrete Co.*, 282 U. S. 175 (1930), when he said, p. 184:

"Methods and apparatus for moving concrete by compressed air had been previously invented. See Smith's patent, 122,498. The court below, in No. 3, indicated that this had not been found practicable. There is no support in the record for any such finding and against it stands the presumption of operability from its patenting."

To the same effect is *Dashiell v. Grosvenor*, 162 U. S. 425 (1896) and *Dalton v. Rockford*, *supra*.

In view of this presumption, the burden of overcoming it rests upon plaintiff.

UTILITY—OPERATIVENESS.

The rule is that a patent structure is not to be considered by its standing alone, but in the light of the art as it existed at the time of the advent of the patent in suit. If the law were otherwise, then one could only copy in detail what is shown and described in the prior patent without using "the skill of the calling" at the time of the advent of the patent in suit. Thus, to determine the operativeness of a patent structure, a skilled mechanic can take the disclosure and supplement it by what

he knows. *Walker on Patents*, 6th Ed., p. 147, states the rule:

> "If, however, an invention performs a good function, though but imperfectly, its utility is not negatived by the fact that it is susceptible of improvement, which will make it operate much better, nor by the fact that some prior invention performed the same function quite as well, or even performed it with superior excellence. Nor is utility negatived by later inventions which are so much superior to the patented process or thing, that they entirely superseded the use of the latter. Indeed, patents are never held to be void for want of utility, merely because the things covered by them perform their functions but poorly."

A leading case on this is the *Bell Telephone case*, 126 U. S. 1 (1888), where the patent was attacked because it was alleged to be inoperative, and Mr. Chief Justice Waite comments on this, p. 536.

The operativeness of an anticipating device, which was disclosed in an engineering publication, and concededly not being commercially practicable, yet it did not lack invention, was held in *Sparks-Withington Co. v. Joy*, 270 Fed. 449 (C. C. A. 6, 1921), where Judge Knappen affirmed Judge Westenhaver of this District, and said at p. 452:

> "We think the Tice device, as disclosed by him, cannot be pronounced inoperative in a patentable sense, although under many conditions likely to be met it would fail to function, and thus could not be successful commercially. But, testing the disclosure as we think we should by the rules applicable to a patent, the device, as described, did not lack invention merely because the inventor did not successfully bring his art to the highest degree of perfection, nor because, without changes in or additions thereto, it could not be successful commercially."

To the same effect in *Universal Rim Co. v. Firestone Steel Products Co.*, 289 Fed. 884 (1923), opinion also by Judge Westenhaver, and *Sun Ray Gas Corporation v. Bellows-Claude Neon Co.*, 49 Fed. (2) 886 (C. C. A. 6, 1931), where the contention was made that the Neon tube of the patent did not have a life of 1,000 hours as was required in order to make the structure commer-

cially feasible, and of this, Judge Hickenlooper said, p. 889:

> "Conceding that present day competitive conditions require a life of 1,000 hours, that Claude contemplated the use of say 2 mm. pressure, that at this pressure the life of the tube would be much less than 1,000 hours, and that the present great commercial utility of neon tubes is due almost exclusively to the later discovery by some one of the advantages of using pressures as high as 15 mm., or even 20 mm., the argument still falls far short of establishing invalidity. The invention of Claude was the primary one on which all subsequent developments were founded. The test is not that of commercial utility, but rather of operative utility and the forward step."

Plaintiff's answer to this contention is that the Franquist patent was never used commercially, and that the effort to use it commercially failed because it was no better than the trunk type piston so far as commercial flexing was concerned. This is met by the decision of Judge Knappen in *Sparks-Withington Co. v. Jay, supra*, for the argument was there made that by actual test the device was shown to be inoperative and useless. Judge Knappen goes on to point out in the quotation, *supra*, that a device cannot be pronounced inoperative in a patentable sense, although under many conditions it would fail to function, or could not be used successfully commercially.

Plaintiff also relies on a rule that "broad and less broad claims in patents owned by the same party are infringed by the same structure," citing *Byers Mach. Co. v. Keystone Driller*, 44 F. (2d) 283 (C. C. A. 6, 1930). From the first Syllabus and reading of this case it appears to have concerned a basic patent, and "if valid, it is entitled to a breadth of construction permitted to pioneers in any art." Admittedly, the patents relied upon by plaintiff are not pioneer patents, which clearly distinguishes the situations.

The burden of overcoming the presumption rests upon plaintiff, and plaintiff offers no convincing test of the inoperativeness of Franquist.

Plaintiff is estopped to deny that Franquist advanced the art and to deny that Franquist discloses an operative piston which will automatically yield sufficiently to prevent the piston from sticking in the cylinder

while hot and slapping when cold, and is further estopped to deny that Ex. 1 has the essential structure, function and mode of operation described in the Franquist patent, which likewise applies to Sterling pistons, Exs. BBB, CCC, 3-J and 3-O. Holding otherwise would permit the plaintiff to shift its position as its interest required, which is not permitted in a court of equity; to which may be added that plaintiff has not overcome the presumption of operativeness, utility and practicability of the Franquist patent raised by the grant of the patent.

In this connection defendants also urge that there is a misunderstanding as to the function of vertical slotting, that is to say, that the vertical slot in Ex. 1 does not make the skirt of the piston flexible at the top. The same claim is made for the other Sterling pistons. Defendants assert that a structure such as Ex 1 has a skirt which is not flexible at the top, with its dashed-in walls attached to the head by additional ribs, both inside and out. Defendants claim the compensation results from the use of the Keystone relief which is demonstrated in the action of the forces by the vectors, as shown in Defendants' Ex. 4-A.

The claim is that in the Sterling pistons the skirt is tied to the head at the top, and expansion must be and is compensated for by the reliefs in the region of the wrist pin bosses which have to be carried into the thrust faces at the top. Defendants' claim is that such Keystone relief only made the Maynard piston workable, of which more later. Finally, defendants urge that the Sterling pistons act at the top like the plain trunk pistons with slots, as in the prior art, providing flexibility at the bottom with compensation at the top by the Keystone reliefs. In this it is urged that the Sterling pistons cannot be distinguished from the Franquist which they follow so closely in structure, function and mode of operation. If this be true, then defendants have not invaded the domain of plaintiff's patents, and equitable relief under the statute should be denied.

ABANDONMENT BY GULICK OF FEATURES IN STERLING PISTONS CLAIMED TO INFRINGE.

The defenses of abandonment and public use were raised by the answers, and came into the case with plaintiff's position that the 1911 and 1914 pistons were within the Gulick patent (Tr. p. 235).

Early in the testimony of inventor Gulick it appeared that he made pistons in 1911 and 1914, represented

by Exs. 48 and 51. Upon defendants' insistence that plaintiff should state what Gulick patent claims covered these early pistons, before the case was closed, plaintiff's counsel enumerated certain claims which the two early Gulick pistons showed as exemplifying claims of the Gulick patent, which claims were also infringed by the various Sterling pistons.

This presents a question whether the subject-matter involved in the 1911 and 1914 pistons was abandoned to the public by the plaintiff or its privies in title prior to the earliest applications of the patents in suit. If abandoned, those pistons are in the public domain and defendants have not infringed the statutory rights of plaintiff by manufacture, wholly or in part, and by sale of any pistons corresponding to those abandoned or deviating therefrom in matters involving merely mechanical skill, which in this case are the obvious expedients of the piston art.

The statutory requirements on the subject of patent pertinent here are R. S. 4886, 4920:

> "Any person who has invented * * * any new and useful * * * machine, * * * unless the same is proved to have been abandoned, may * * * obtain a patent therefor * * *.
>
> In any action for infringement the defendant * * * may prove on trial * * * (5) that it had been in public use or on sale in this country for more than two years before his application for a patent, or had been abandoned to the public."

These requirements both as to prior use and abandonment must be considered in the light of the facts in the case at bar. There are two different issues, one, a statutory bar, and the other, at large on facts to be established; but plainly the latter may be made out on proof directed to what occurred either before or after the bar had fallen.

Plaintiff states that the Sterling pistons infringe from 5 to 9 claims of the Gulick patent embodied in these 1911 and 1914 pistons, so that with the facts which developed at the trial, the issue is made as to whether Gulick abandoned his invention. Gulick testifies that in 1908 he conceived a piston like Ex. 51, the 1914 piston, but he did nothing except make sketches until May, 1911. The 1911 piston (Ex. 48), the head of which Gulick states was diametrically reduced to the slot, was tested out in May, 1911, by the use of a set of such pistons in a motor-

cycle; they were also given a block test of 4,000 revolutions per minute, and while one broke at the pin boss, there was no seizure; that test established the flexibility of the piston.

In July a set of such pistons were placed in an Excelsior motor and run for 24 hours; the engine containing these pistons was then placed in a Renault car and driven to the Elgin road races in August, and found satisfactory. In his Preliminary Statement in Interference No. 49,569 (Defendants' Exs. 5F-1 and 5F-2), as to whether the test was a reduction to practice and whether Gulick was satisfied, he says;

> "that on or about the 25th day of August, 1911," (date of Elgin road races) "he first explained the invention to others; that he first embodies his invention in a full sized engine, which was completed about the 25th day of August, 1911; and that on the said 25th day of August, 1911, the said engine was first successfully operated, at the City of Chicago, County of Cook, in the State of Illinois."

The run to Elgin was 150 miles round trip, and the Renault car was driven until November 1, 1911, over 3,000 miles for personal and company business, operating to his satisfaction, and except for mechanical repairs the pistons were in perfect condition on November 1st, when they were removed from the car, the car sold with other pistons in it, and pistons like Ex. 48 were scrapped.

No original drawing of these pistons has been preserved, the only drawing being that of the Gulick original sketch (Ex. 36), and his detail drawing, both showing the detail construction of the application. In the meantime he had taken his piston drawings to various patent attorneys, and took out applications for other patents. Apparently he was so well satisfied with the 1911 test that when he made the Ex. 51, the 1914 piston, it was at once placed in his own Amplex car which was driven anywhere from 2,500 to 5,300 miles from July 16th to November 11th, the car being used for general purposes by him and for the company with which he was then connected. He testified that the pistons gave perfect satisfaction, and on November 11, 1914, were removed from the car at the Amplex plant and later sold with other junk when the plant was sold in receivership.

No sketch of the 1914 piston has been preserved except we have the piston construction of the application which Gulick says was his idea of the proper design.

Gulick did nothing with his piston until in August, 1917, when it was turned over to the Packard Motor Car Company with other so-called inventions for which he had given an option to Packard in March, 1916. Packard did nothing with this piston until an application was filed November 30, 1917, although Packard had taken out many other applications since acquiring the option in March of the previous year.

Defendants contend that the 1911 and 1914 pistons were thoroughly abandoned. There is no evidence to corroborate Gulick of any communication to the Packard counsel, Tibbetts, about these 1911 and 1914 pistons. The 1911 and 1914 pistons do not appear in his application, which illustrates and describes only the web piston of the Gulick 1911 sketch and the 1914 drawing, and there is no other evidence that they ever were tried out or had any commercial history. The 1911 and 1914 pistons do not even appear in his affidavit of December 2, 1921 (Ex. 4-L, p. 1859-1860), but again what appears is the drawing of the application construction (Ex. 32), and the affidavit states, referring to the blueprint like Ex. 32:

> "that a photoprint of such blue print is attached hereto; that the longhand notes on said blue print which show in the photoprint were made by him on the blue print prior to the month of October 1915; that said invention was incorporated in an automobile engine and successfully operated in the United States prior to the month of October 1915."

There is no evidence that such a piston was ever made, let alone tested; and the date of October, 1915, carries back of the filing date of the Schoengarth patent. Any help in the way of correspondence between parties that could be obtained as to the relations between Gulick, the inventor, and the Packard Company, his assignee, the Packard Company a beneficiary of this plaintiff trust, was denied as counsel stood upon their rights as to privileged communications.

The 1914 piston first comes to light on November 8, 1922, when Gulick made the sketch (Ex. 33) bearing that date at Cleveland, in preparation of the Interference. He says he did not tell anyone about the 1911 piston "because he was not asked."

In this situation the following statement in the recent *Teapot Dome* case, 275 U. S. 13 (1927), by Mr. Justice Butler, is quite in point, and this authority was

again cited by Mr. Justice Cardozo in *Cooper v. Dasher*, 54 Sup. Ct. Repr. of November 15, 1933, at p. 7:

> "Familiar rules govern the consideration of the evidence. As said by Lord Mansfield in *Blatch v. Archer*, Cowper 63, 65: 'It is certainly a maxim that all evidence is to be weighed according to the proof which it was in the power of one side to have produced, and in the power of the other to have contradicted.'"

Considering Gulick's testimony as to differences between the 1911 piston and the 1914 piston, his personal views appeared as to what design will satisfy the engineer, overlooking the fact that in 1914 he merely redesigned the 1911 piston for aluminum use, put in two webs instead of one, ran the horizontal slot all the way around, and made the vertical slot nearly straight.

Gulick's activities and the chronological history of the discovery of his device and of his piston patent extending over twenty-three years are unique:

1908: Conception like Ex. 51, the 1914 piston (Tr. p. 742).

1911: May, Motorcycle piston given block test and Gulick was thoroughly satisfied with it (Tr. p. 733); July, Excelsior automobile piston given a block test, to the full satisfaction of Gulick (Tr. pp. 745-6), and Excelsior motor with pistons like Ex. 48 given a run-in test (Tr. p. 707); August, Engine with the run-in pistons placed in Renault car and given a road test to Elgin, for 150 miles; ran perfectly to Gulick's satisfaction; which was the reduction to practice alleged in his Preliminary Statement (Tr. p. 815); November, after use of these pistons in the Renault car for the difference between 2500 to 4000 miles and 150 miles, using the car for personal use and for company business (Tr. p. 732), the pistons were allowed to go to the scrap heap.

1914: May, aluminum piston drawings made and ordered; July, aluminum piston made, not given a block test; had in his personal car and run for over 5,000 miles; thereafter, pistons were let go to the scrap heap (Tr. pp. 734, 739-42).

1916: March, Gulick gives option on piston to Packard with other devices.

1917: August, assignment to Packard Motor executed, and November 30th patent application filed.

1922: September 12th, amending application filed broadening claims and introducing flexibility; and on November 8th made sketch Ex. 33 of 1914 piston.

1922-1931: Interference proceedings with Long, Hartog and others.

1931: April, further amendments and patent issued July 21st.

The testimony of Gulick first given at this trial showed that the pistons of 1911 and 1914, as to fitting and results, ran perfectly (Tr. p. 708), and apparently a clear case of actual and statutory abandonment was made out not only for 1911 use but repeated in 1914. After recess, upon the following day witness Gulick showed a surprising knowledge of experimental use, and his testimony became an about face and an argument that the 1914 pistons were nothing but an experimental use as contemplated by the law; and he sought to limit his previous testimony by saying that the pistons "only operated satisfactorily as far as the split skirt idea was concerned." (Tr. pp. 755-6).

The question presented is one of abandonment, i.e. at large or statutory, both of which are covered by the statute R. S. 4886. *Walker on Patents*, 6th Ed., Vol. 1, in Chapter VII, under the general subject, discusses statutory abandonment as constructive abandonment. The policy of the law was early laid down by Mr. Justice Storey in *Pennock & Sellers v. Dialogue*, 2 Peters, 27 U. S. 1 (1829), where the court considers the then patent statute from the standpoint of abandonment, and says, p. 16:

> "It has not been, and indeed cannot be denied, that an inventor may abandon his invention, and surrender or dedicate it to the public. This inchoate right, thus once gone, cannot afterwards be resumed at his pleasure; for, where gifts are once made to the public in this way, they become absolute. Thus, if a man dedicates a way, or other easement to the public, it is supposed to carry with it a permanent right of user."

Courts approve a reasonable delay in the filing of an application when the completion of the invention and the testing of its values "by a series of sufficient and practical experiments is necessary," *Kendall v. Winsor*, 21 How. 322 (1859), and that abandonment may show "either by express declaration or by conduct equally significant with language." The rule is stated in *Pitts v. Hall*, 2 Blatchf. 235, by Mr. Justice Nelson, that the patentee may forfeit his right "if he use it publicly him-

self in the ordinary way of a public use of a machine at any time prior to two years before he makes his application for a patent."

The leading case is *Consolidated Fruit Jar Co. v. Wright*, 94 U. S. 92 (1876), which cites this rule, where was involved the defense of abandonment as well as prior public use and sale. After having made about two dozen fruit jars, Mason left one of them with the manufacturer and never called for it, so that it was sold at auction and this neglect for some eight years "is full of significance and has an important bearing upon the question of abandonment;" and Mr. Justice Swayne said, p. 96:

> "It is enough to say, without recapitulating the facts, that in our judgment the defence of abandonment to the public is also clearly made out * * *. Inventors are a meritorious class. They are public benefactors. They add to the wealth and comfort of the community, and promote the progress of civilization. A patent for an invention is as much property as a patent for land. The right rests on the same foundation, and is surrounded and protected by the same sanctions. There is a like larger domain held in ownership by the public. Neither an individual nor the public can trench upon or appropriate what belongs to the other. The inventor must comply with the conditions prescribed by the law. If he fails to do this he acquires no title, and his invention or discovery, no matter what it may be, is lost to him, and is henceforward no more his than if he had never been in any wise connected with it. It is made, thereupon, as it were by secretion, irrevocably a part of the domain which belongs to the community at large. The invention here in question is within this category."

The case most relied upon by plaintiff to negative abandonment is *Elizabeth v. Pavement Co.*, 97 U. S. 126 (1877), where the court says, p. 134:

> "An abandonment of an invention to the public may be evinced by the conduct of the inventor at any time, even within the two years named in the law. The effect of the law is, that no such consequence will necessarily follow from the invention being in public use or on sale, with the inventor's consent and allowance, at any time within two years before

his application; but that, if the invention is in public use or on sale prior to that time, it will be conclusive evidence of abandonment, and the patent will be void."

An inventor was testing the durability of his pavement over a period of years, and it was held that this was not a public use so long as the inventor was engaged in good faith in testing its operation. There the pavement was laid on a toll road, much used by traffic, and the inventor delayed filing, examining it daily, and while he did not find changes were necessary, the court said "yet he may justly be said to be using his machine only by way of experiment."

Light on this question of abandonment is to be had in the two cases of *Macbeth-Evans Glass Co. v. General Electric Co.*, 231 Fed. 183 (this District, 1916), which was a case involving the secret use of a process before applying for a patent thereon. The decision below was by the late Justice Clarke, and was affirmed in 246 Fed. 695 (C. C. A. 6, 1917), Judge Warrington writing the opinion. The court points out that the question of abandonment is one of fact and one of relinquishment of a right to a patent, and considers the situation analogous to what is involved here, where instead of continuing the practice of the invention in secret, the subject-matter thereof "is cast away or destroyed." The court considered the failure of the patent statutes to prescribe a period within which a patent must be applied for. In that case the inventor of a process for making glass used it in secret for nearly 10 years, selling the product. At the end of that time, when the secret was betrayed by an employee, the inventor applied for a patent and the court held that the policy of the patent law to secure the full benefit of inventions would be defeated if an inventor could withhold his invention from the public for an indefinite time, for his own profit, keep it a trade secret, and then have the right to secure protection under the patent laws. The reasoning of the Court of Appeals of the 6th Circuit was approved by Mr. Chief Justice Taft in *Woodbridge v. United States*, 263 U. S. 50 (1923), to the effect that the purpose and the result of the conduct of the inventor was unduly to postpone the time when the public could enjoy the free use of the invention. In this last case the Chief Justice spoke of the unconscionable postponement of the end of the inventor's

monopoly (there 10 years) as the result of the inventor's "deliberate design."

Almost the identical situation as is here arose in *Allinson Mfg. Co. v. Ideal Filter Co.*, 21 F. (2d) 22 (C. C. A. 8, 1927). Allinson reduced his gasoline filter (for dry cleaning) to practice in July, 1914, and continued its use until December, 1916, then he dismantled the apparatus, sold it, and went into another business. Later he went back into the cleaning business but did not use his filter, and after seeing another filter about three years later, somewhat in general aspects the same although not an infringement of the subsequently issued Allinson patent, he filed his application for the patent in suit. His use was entirely in secret and in his own business, the filter being made out of an old still, so that it was not a commercial device, and the court held this to be an abandonment, relying upon the *Macbeth-Evans case, supra*, saying that upon the facts it clearly constituted a public use within the purpose and meaning of the statute. Judge Lewis said, p. 26:

> "Assuming, however, that he had an intention at any time to apply for patent, which was not proven, the conclusion cannot be avoided that he wilfully and negligently postponed his application, and that, too, until after others had become engaged, to his knowledge, in efforts to discover and put in use a machine for clarifying gasoline for clothes cleaning purposes." * * *
>
> "In the light of the record we think he abandoned his rights when he dismantled his machine in 1916, went into the moving picture business and manifested no further interest in his invention until he saw Le Vora's machine in February, 1920."
>
> * * * * "We think it immaterial whether Allinson's inaction and lack of interest be defined as abandonment, willful negligence or cause for forfeiture. It was conduct in direct opposition to the purpose and policy of the law under which he might have acquired rights had he been diligent."

As in the *Macbeth-Evans case, supra*, the equitable rule of election applies. Gulick tested the 1911 piston, used it in his car for 3,000 miles, then scrapped it. He permitted the same thing to be done with his 1914 piston, retaining not even a sketch or sample of that piston.

When selling to Packard he did not tell Tibbetts about it and said nothing about the 1911 and 1914 pistons in his application, and did not even raise the question in his supplemental oath of December 2, 1921, but first tells of it on November 2, 1922, thus establishing a situation where the rule of election applies to make a case of abandonment. Packard was bound by Gulick's acts by its own failure, after acquiring the Gulick rights, to make any application before November 30, 1917, and of course plaintiffs are bound by the acts of Gulick and Packard, *Comptograph Co. v. Adder Machine Co.*, 41 App. D. C. 427.

STATUTORY ABANDONMENT.

The fact that a device is not used continuously for two years does not take it out of the statute, the Supreme Court having construed the patent statute as if the word "for" had been omitted, *Consolidated Fruit Jar Co. v. Wright, supra*. A patent is void because of a public use more than two years before the application, even though the device had been used only on a few occasions or for a short period of time, *Thomson v. Lorain Steel Co.*, 117 Fed. 249 (1902); *LeRoy v. Nicholas Power Co.*, 244 Fed. 955 (D. C. N. Y., 1917). There was no concealment of the pistons, for as to the use in the Renault car, Gulick testified that the 1911 Renault car was "used the same as any other car;" and the 1914 Amplex with his aluminum pistons was used for both company and personal business (Tr. pp. 732-737), and people in the shop saw them, so that no such circumstances there are a public use, *Smith & Griggs Mfg. Co. v. Sprague*, 123 U. S. 249 (1887), where Mr. Justice Mathews says, at p. 254:

> "It was a public use in the sense of the statute and within the decisions of this court, inasmuch as it was used by the complainant in the regular conduct of his business by workmen employed by him in its operation, and in the view of such part of the public as chose to resort to his establishment."

That the pistons when in actual operation were inside the cylinders and concealed from view, does not take such use out of the statute, *Hall v. MacNeale*, 107 U. S. 90 (1882). After the recess Gulick was not so sure that his pistons of 1911 and 1914 were perfectly satisfactory, and on the question that his activities were only what is known to the patent law as an experimental use, the

decision in *Eastman v. Mayor*, 134 Fed. 844 (C. C. A. 2, 1904), contains a complete discussion of this subject by Judge Coxe on p. 857-9, with the court's summary of the law:

"From these authorities we deduce the following propositions, as applicable to the present controversy:

"First. An inventor has a reasonable time in which to experiment for the purpose of perfecting the invention and demonstrating its utility.

"Second. The time thus spent, if in good faith, is no part of the two-year statute of limitations.

"Third. The experiments must be made in perfecting the invention as described and shown.

"Fourth. Experiments made in testing parts of the machine not covered by the invention will not have the effect of extending the two-year period.

"Fifth. As soon as the invention is completed, viz.: 'in such a condition that the inventor can apply for a patent for it,' the two-year period begins to run and the application must be made within this period.

"Sixth. The fact that the invention has been improved since its original embodiment does not demonstrate that it was then embryonic or incomplete.

"Seventh. When a clear case of prior public use is established the burden is on the inventor to prove by convincing proof that the use was experimental.

This rule has been followed in this Circuit in *Jenner v. Bowen*, 139 Fed. 556 (1905), where Judge, later Mr. Justice Lurton, referred to Judge Coxe's decision as fully considered and the cases all examined. This later case was followed by Judge Denison in *Austin Machinery Co. v. Buckeye Traction Ditcher Co.*, 13 F. (2d) 697 (C. C. A. 6, 1926), and by Judge Westenhaver in *Kerner Incinerator Co. v. Townsend Estates, Inc.*, 27 F. (2d) 599 (N. D. Ohio, 1926). The use does not escape the statute unless the experimental use is limited to such use as is necessary to determine the ability of the device to perform the function for which it is designed. The inventor is entitled to use or test the device during its development, to an extent to determine its utility or ability to fulfill the function for which it is intended. When the purposes of the test are fulfilled and success indicated, then

the period of experimental use ends, and the statutory 2-year period begins.

The splitting of the piston having proved successful in 1911 could not be made the subject of additional experimental use in 1914, and thereafter be patented as in the Gulick patent without reference to the modification (aluminum) which was made in 1914. The defendants having made a case of public use, whether by the patentee or another, the burden is then upon the patentee to show, if he can, that the public use was an experimental one. This the plaintiff has failed to do, notwithstanding the belated assertion of inventor Gulick that his 1911 and 1914 uses were experimental only, that being only his descriptive term and does not constitute this an exception to the public use described by the statute. The use may be public although concealed by the nature of the invention itself, as in the corset case, *Egbert v. Lepman*, 104 U. S. 333 (1881).

Plaintiff relies upon *International Telephone v. Kellogg*, 171 Fed. 651 (C. C. A. 7, 1909), where Dean had perfected a telephone transmitter and had used it only for determining its efficiency, and this was held to not be a public use, there being no abandonment; also upon *Reo Motor Car v. Gear Grinding*, 42 F. (2d) 965 (C. C. A. 6, 1930), where there is also an attempt to carry the date back, the inventor was met with a claim of public use, but in this case, as Judge Denison points out at p. 969, the use during all the period was public enough and was in connection with the current sales of the product, but the embodiment of all steps of the combination was not completed and the court concluded that it did not clearly and satisfactorily appear that the effected and completed method was in public use; and also in *Kerner Incinerator Co. v. Townsend*, *supra*, the patentee was still engaged within the 2-year period in modifying and constructing a second device to overcome the difficulties of the original.

Plaintiff urges that mere delay in filing an application on an invention is not abandonment unless some independent inventor intervenes and forestalls the first invention, and relies upon *Hanger v. Rowley*, 298 Fed. 359 (1924). In that case there was no use of the artificial limb by the patentee from three to six years for periods of four months in each year, before he filed his application, and this was not followed by permitting the limb to be scrapped and leaving the structure entirely

out of the application. It would seem that the most that this case decides is that mere delay is not abandonment.

In the case at bar substantial rights intervened before Gulick broadened his claims and brought forward his 1911 and 1914 pistons in 1922. It is true that in the *Mason Jar* case large interests had grown up in the way of manufacture, but the Supreme Court did hold that the patent was invalid, not only on the ground of public use, but on the ground of abandonment. Counsel fail to distinguish between abandonment and estoppel, and if it is believed that there is a conflict between *Hunter v. Rowley, supra*, and the *Macbeth-Evans* case, *supra*, whatever may be said of these decisions there is no question but the rule in this Circuit is the law as stated by the later Justice Clarke's decision, affirmed by the Court of Appeals and quoted with approval by the Supreme Court in *Woodbridge v. U. S., supra*.

There was no adjudication by the Patent Office on abandonment or public use, yet plaintiff urges that the failure of the Patent Office to act is a persuasive or controlling reason in this proceeding, and urges this notwithstanding there is no proof that the abandonment question was ever before the Patent Office.

There is no rule which requires such a holding here, even the rule of comity is hardly applicable. Comity is not a rule of law but one of practice, convenience and expediency, and as Mr. Justice Brown said in a patent case, *Mast, Foos & Co. v. Stover Mfg. Co.*, 177 U. S. 485 (1899) at p. 489:

> "It demands of no one that he shall abdicate his individual judgment, but only that deference shall be paid to the judgments of other coordinate tribunals. Clearly it applies only to questions which have been actually decided, and which arose under the same facts."

And further, in answer to this argument:

> "Comity, however, has no application to questions not considered by the prior court, or, in patent cases, to alleged anticipating devices which were not laid before that court."

Plaintiff relies upon *Gordon v. Walcott*, 42 F. (2d) 55 (C. C. A. 6, 1929), which involved an interference proceedings and patentability had been considered in another suit between the same parties. Gulick may have been "thinking of reduction to practice and not a public use,"

but as in the *Allison v. Ideal Filter* case, *supra*, he made out a public use, and after recess, a case of abandonment; and the Patent Office did not find that Gulick had done "no more than reduce to practice in 1914," for the Patent Office had never passed upon these questions.

If there should be question as to whether Gulick's reduction to use of the 1911 and 1914 pistons was in fact a commercial use, a recent decision gives light on this subject. That the actual construction of the early Gulick pistons in evidence here could not be patented after the falling of the bar of the statutory period, seems elementary, yet such rule has been questioned and was answered in *U. S. Blind Stitch Mch. v. Reliable Mch.*, 67 F. (2d) 327 (C. C. A. 2, 1933). There a heating machine had been claimed in a former application, was rejected by the Patent Examiner and dropped by the inventor. Later another claimed this device and the court held abandonment had occurred more than two years before. Judge Manton said, p. 329: "This constituted a sufficiently clear anticipation by a machine which had been reduced to practice," and cited *Corona Cord Tire v. Dovan Corp.*, 276 U. S. 358 (1928). The question of reduction to practice was considered by the Supreme Court in this case, and Mr. Justice Taft said, p. 384:

> "It is a mistake to assume that reduction to use must necessarily be a commercial use. If Kratz discovered and completed, as we are convinced that he did, the first use of D. P. G. as an accelerator in making vulcanized rubber, * * *. It is not an abandoned experiment because he confines his use of the rubber thus produced to his laboratory or to his lecture room. It is doubtless true that Kratz, by his course in respect to his discovery as to the use of D. P. G., has abandoned any claim as against the public for a patent, * * *."

The court concluded that the first discoverer of the useful accelerator in the vulcanization of rubber was Dr. Kratz and not Weis; so here, Gulick's testimony established his early reduction to use, and so he could not more than two years thereafter claim discovery. This comment omits any consideration of the reduction to use by Monckmeier or of the later uses by Schoengarth and Long.

There is also great significance in Gulick's testimony about his early use of these pistons to the cause of de-

fendants, for proof on this vital point comes from a hostile witness and gives strength to defendants' claims. Of such evidence, Mr. Chief Justice Taft remarked, in *Eibel Coal Co. v. Minnesota Paper Co.*, 261 U. S. 45 (1923), p. 53, it is "a strong case" that is made from the testimony of opposing witnesses.

VALIDITY OF GULICK PATENT IN VIEW OF RIGHTS INTERVENING BEFORE HIS ORIGINAL APPLICATION WAS BROADENED.

The Gulick patent was applied for November 30, 1917, and was issued July 21, 1931. There was also his use of the piston in 1911 and 1914. In this 20-year period many things happened in the improvement of pistons, which industry is bound up with the development of permanent molds in piston making, as replacing the old sand mold.

Packard Motor acquired the Gulick option in March, 1916; its assignment of the patent in August, and the patent application was filed November 30, 1917. His 1911 and 1914 pistons were forgotten, or in any event unmentioned until the Gulick amendment of November 12, 1922.

The independent piston manufacturer won in the controversy with the Aluminum Company of America when the Court of Appeals of the 8th Circuit held, in *Aluminum Company of America v. Sterling Products*, 66 F. (2d) 958 (1933), that there was no infringement in its use of permanent molds to make pistons. Here the distributor defendants urge that the plaintiff, particularly Packard Motor Company, notwithstanding intervening rights of others, so amended the specification and claims as to not only cover what had been in public use and in issued patents, but so as to convert the specification into the very antithesis. The adverse rights intervening relied upon by defendants are the Long pistons used by Franklin dealers as early as 1917, and the Long patent; the Spillman patent of 1919, with the piston marketed by Kant Skore, rights to which were acquired by plaintiff; the Schoengarth patent of 1916; the Moeskmeier piston used in his racing car 1912 to 1916; the Hartog patent of 1920, acquired by plaintiff, and the Jardine and Maynard pistons in use before the radical change in the Gulick specification as amended September 12, 1922.

The file wrapper of the Gulick patent shows his application to describe a specific construction, viz. a piston structure in which the skirt is entirely separated from

the head by a slot extending entirely around, the head being connected to the skirt by webs, and the skirt split between those webs. The original specification emphasized rigidity of the piston, stating one of its objects "to rigidly support the piston pin bosses of a piston from the piston walls," and by further stating the construction provides "an extremely rigid construction between the piston pin bosses and the skirt." After the Hartog patent this wording of the Gulick application was changed and added to so as to make it "flexible" rather than "rigid." This followed the Hartog patent 1,842,022, filed February 16, 1920, and the Long pistons were also on the market at that time. The Gulick application was amended in October, 1921, to cover the Spillman structure which was exemplified in the Kant Skore piston, although plaintiff now says that the Spillman patent structure, which it owns, was worthless. Gulick's counsel further amends in December, 1921, to cover the Schoengarth patent construction, the Long patent 1,395,441 issued two months previously, and Gunn, a Packard engineer, had described the Long piston in "Automotive Industries" of January 29, 1920.

After the Patent Office rejected several claims in January, 1922, Gulick filed an amendment on September 12, 1922, wherein he converts "an extremely rigid connection" between the piston bosses and the skirt of the piston into a "flexible connection." This apparently is in order to strike Hartog and also Long whose pistons had been in service for over two years and were described by Packard's engineer two years and a half before. Hartog, on February 16, 1920, had filed an application for a piston which for the first time disclosed the utility of connecting a skirt with the head through the medium of flexible webs. His application went into interference with Pomeroy, owned by the Aluminum Company of America, and now patent 1,499,073 owned by plaintiff trustee. The Examiner decided in favor of the Aluminum Company but was reversed by the Board of Appeals on August 30, 1922 (Ex. 5-H3). This date is important for within two weeks thereafter, on September 11th, the Gulick application is assigned by Packard to the plaintiff, and on the next day the amendment is filed in the Patent Office, substantially changing the Gulick application.

The amendment contains claims taken from the Long patent and Hartog-Pomeroy interference. There is also a claim to catch the application of the Maynard patent 1,655,968 filed January 3, 1921, now owned by plaintiff,

which Maynard pistons were placed on the market by Maxwell after the Jardine piston had been finished. As before noted, plaintiff later acquired one-half interest in the Maynard patent.

After rejecting several of Gulick's claims, claim 27 which corresponded to claim 10 of the Long patent, was retained and an interference was declared, Gulick having eliminated the "Fulgurite" terminology.

Since the rule of the Patent Office is that where a claim is considered in an issued patent and goes into an interference with a pending application, neither the patentee nor the applicant can dispute the validity of that claim; *Banks v. Ball*, 1887 C. D. 39; *Hermanite-Mejia v. Kelly*, 277 Fed. 699 (1922); *Graves v. Hamby*, 37 F. (2d) 425 (1929); also there is the rule that claims are given the broadest constructions as long as they will "read" upon the applicant's device; *Banks v. Ball*, *supra*; *Lynch v. Hamby*, 295 Fed. 1003 (1923); *Woelm v. Hasselquist*, 62 F. (2d) 305 (1932).

The Patent Office was in this dilemma: the Long patent reads upon Van Bever and Rainforth structures, the patents to Serez (French) and Ebbe, and the office had given claim 10 to Long and it later took the position that it did not involve any invention to split the skirt by Spillman & Messrs and Chenard & Walcker. The Office suggested five claims to Gulick which set out the feature of flexible webs, and this Gulick only accepted with reservation so he was not bound to the statement that patent structure was yielding, leaving it open to be later said that it was rigid. In these controversies Gulick won all the interferences which were not dissolved on account of unpatentability.

In April, 1931, Gulick asked additional amendments to the specifications and claims. Being powerless to dispute the additional claims of the amendment, which now added "another object of the invention is to rigidly separate the piston bosses of a piston from the piston walls," the Examiner thought this covered something the applicant did not have in mind when his case was filed, or at least "which is beyond anything disclosed in his application." Gulick then amended in May, 1931, filing his Supplemental Oath, where it is pointed out that the Patent Office is bound by the higher tribunals, and following this the application was allowed May 16, 1931 and the patent issued in July.

In this situation defendants urge that the Patent Office was misled, and that after a decision by the courts,

Long v. Gulick, 17 F. (2d) 687 (1927), the Patent Office was in a position where it could not refuse to allow the issue of a patent, *Hartog v. Long*, 47 F. (2d) 369 (1931). Defendants urge the intervening rights of Spillman (Kant Skore) and Hartog; that Maynard (Maxwell) and Jardine (Aluminum Company of America) were purchased; that Long was harassed by an interference proceeding and a suit (Ex. 4-Z); that Monckmeier had used his pistons in racing cars, and that Schoengarth had made and sold his pistons.

Defendants urge that there has been such manipulation that a Court of Equity should look with disfavor upon plaintiff's application. The leading case relied upon is *Railway Company v. Sayles*, 97 U. S. 554 (1878). An invention involving a brake system for railways, filed in 1847, laid dormant for five years when it was "considerably modified" and changed after being purchased by Tanner. Reliance was had upon a prior reduction to practice in the fall of 1846, and in the meantime brakes were made by others and had gone into general use. Mr. Justice Bradley said, p. 563:

> "It will be observed that we have given particular attention to the original application, drawings, and models filed in the Patent Office by Thompson and Bachelder. We have deemed it proper to do this, because, if the amended application and model, filed by Tanner five years later, embodied any material addition to or variance from the original,—any thing new that was not comprised in that,—such addition or variance cannot be sustained on the original application. The law does not permit such enlargements of an original specification, which would interfere with other inventors who have entered the field in the mean time, any more than it does in the case of reissues of patents previously granted. Courts should regard with jealousy and disfavor any attempts to enlarge the scope of an application once filed, or of a patent once granted, the effect of which would be to enable the patentee to appropriate other inventions made prior to such alteration, or to appropriate that which has, in the mean time, gone into public use."

The rule that runs through the authorities seems to be that an amendment of something new will not be permitted. In *Webster Electric Co. v. Splitdorf Electrical Co.*, 264 U. S. 463 (1924), the original application of the

Kane patent was filed in February, 1910, and after prevailing in an interference with Podlesak the claims in suit were also made in an application over five years after the issue of the Podlesak original patent. Mr. Justice Sutherland, speaking for the court says, p. 465:

> "It will thus be seen that claims 7 and 8 were for the first time presented to the Patent Office, by an amendment to a divisional application eight years and four months after the filing of the original application, five years after the date of the original Podlesak patent, disclosing the subject matter, * * *"

And further:

> "A comparison of these claims, as set forth in the patent, with the claims in the original application, to say the least, leaves in doubt the question whether they were not so materially enlarged as to preclude their allowance on the original application. *Railway Co. v. Sayles*, 97 U. S. 554,"

The court then continues, p. 465:

> "But this aside, the evidence establishes to our satisfaction that Kane did not originally intend to assert these amended claims, because he considered their subject matter one merely of design and not of invention; and the inference is fully warranted that the intention to do so was not entertained prior to 1918."

As to adverse rights established by the issue of the Podlesak patent, the Supreme Court says, p. 465:

> "During all of this time their subject matter was disclosed and in general use; and Kane and his assignee, so far as claims 7 and 8 are concerned, simply stood by and awaited developments."

The court discusses and distinguishes decisions in reissue cases and copying of claims in interference cases, and concludes, p. 471:

> "Our conclusion, therefore, is that in cases involving laches, equitable estoppel or intervening private or public rights, the two-year time limit prima facie applies to divisional applications and can only be avoided by proof of special circumstances justifying a longer delay. In other words, we follow in that respect the analogy furnished by the patent reissue cases."

The recent analogous case is *Powers-Kennedy Contracting Corp. v. Concrete Mixing & Conveying Co.*, 282 U. S. 175 (1930), which involved a device for mixing and conveying materials, particularly concrete, in which an air pipe was shown for the purpose of agitating concrete and preventing it from packing. The application was filed in 1907, changes were made in the specification, new claims were added in 1911 and expanded in 1913 by assigning to the air pipe the function of impairing movement of the concrete rather than agitation, so as to inject into the case what Mr. Justice Roberts of the Supreme Court called "a so-called slug theory." The change in front appeared thus: the Leake application was filed in the Patent Office nine months after McMichael, the applicant of the patent in suit filed, which applications were thrown into interference; the McMichael interests purchased the Leake applications with the result that both patents were granted, the McMichael in 1915 and the Leake patent in 1917. Mr. Justice Roberts says, p. 185:

> "And, even if the mode of operation is as claimed, it is to be remembered that Leake in his application of October 7, 1907, uses the same words to describe the operation of his nozzles as we find McMichael subsequently inserted in his specifications and claims. When this application came into interference with McMichael's, he, of course, became familiar with Leake's claims. It is significant that he then amended his claims, almost in the very words of Leake. This of itself destroys the patent. *Railway Co. v. Sayles*, 97 U. S. 554; *General Electric Co. v. Sangamo Electric Co.*, 174 Fed. 246; *Lopulco Systems, Inc. v. Bennot Co.*, 24 F. (2d) 510."

Lopulco Systems v. Bennot Co., 24 F. (2d) 510 (C. C. A. 3, 1928), approved by the Supreme Court, involved a method of feeding coal to furnaces, but did not emphasize the so-called "long flame process" for a furnace. More than two years after the filing of the original application and more than two years after a public use, the long flame theory was for the first time injected into the application. The court held that the process was not suggested by the original disclosure and denied relief on the authority of *Railway Co. v. Sayles, supra.*

Where the original application did not mention the possibility of the use of silicates but that feature was added four years after filing, such practice was denied

in *Dwight & Lloyd Sintering Co. v. Greenawalt*, 27 F. (2d) 823 (C. C. A. 2, 1928), Judge Learned Hand saying, p. 828:

> "We decline to accept such obscure references as even premonitions of the matter added later. They are straws at which the patentee now clutches to extend his invention."

In this Circuit the decisions affirm and carry out the principles announced in the above decisions. *Wagenhorst v. Hydraulic Steel Co.*, 27 F. (2d) 27 (C. C. A. 8, 1928), was a case where the original specification as filed disclosed a number of embodiments and one of these later was included in a divisional application which merely amplified the original, but did not change any theory of action. No adverse rights were involved for the claims of the original application covered the interfering as well as defendant's device, and Judge Denison distinguishes the authorities; and in *Wirebounds Patents Co. v. Saranac Automatic Machinery Corp.*, 37 F. (2d) 830 (C. C. A. 6, 1930) he also discusses questions of interfering rights which are not applicable to the situation here, although relied upon by plaintiff.

Michigan v. Sutherland, 29 F. (2d) 179 (C. C. A. 6, 1928), urged by plaintiffs as authority for their position, fails to meet the situation presented on the facts here, for as Judge Knappen there said, if amendments to the patent application "only amplify or explain" what was already reasonably indicated to be invention, the patent is not invalidated. *Reo Motor Car v. Gear Grinding, supra*, also relied upon by plaintiffs, is not conclusive, for there there was no change except descriptive changes in the claims after the appearance of adverse rights, for as Judge Denison says, p. 910:

> "There was no estoppel arising (if it might sometimes so arise) from a failure to claim the broader monopoly until after some competitor has put out a device not reached by the earlier claims. From the beginning to the end of these applications, Ward was constantly seeking a claim which would clearly have covered every one of defendant's different practices."

As to the conduct of inventors and their patent counsel when they see something about to be used in a competing device which they would then include in their original application, as Gulick was also an inventor of

large experience, the language of Judge Denison in *Wagenhorst v. Hydraulic Steel, supra*, at p. 32 is quite in point:

> "If this conclusion were in doubt, it would be confirmed by Wagenhorst's own conduct. The mechanical advantages of this construction, as just stated, were obvious. Wagenhorst was an inventor of large experience in this particular line and was represented by able solicitors. It is not to be doubted that they would have intended to claim every specific invention which they thought present. It did not occur to either of them that the construction shown in Figure 4 involved any invention in this specific respect. It was only when they saw it was about to be used in a competing device, and realized that, if they failed to secure their broader pending claims there would be no infringement, that they concluded there was specific invention in these details of the assembly, and decided to make the specific claim. We think their first conclusion was the right one."

Gulick 1911 and 1914 Pistons not Illustrated or Described in the Patent.

The 1911 and 1914 pistons produced by Gulick do not appear in his application nor in the affidavit of December 24, 1931, nor in the correspondence of Gulick with Packard produced at the trial; and the existence of the 1914 piston was first relied upon in the affidavit of November 8, 1933, while the 1911 piston appeared later. Defendants urge that such situation, together with the fact that Gulick scrapped his 1911 motorcycle block test and Renault car pistons, permitted the 1914 aluminum piston to be scrapped, are reasons which establish that the 1911 and 1914 pistons were actually abandoned; and this is in addition to the fact that they were in public use for more than two years before Gulick filed his application.

To answer this, plaintiff urges that it was not necessary for Gulick to preserve his pistons, illustrate them in drawings or describe them in his specification, because those drawings and specifications disclosed Gulick's earliest embodiment of this invention for what he considered as preferred, and that he was therefore entitled to build claims covering these 1911 and 1914 pistons upon such descriptions and drawings.

The rule appears to be that after a certain structure is described in specifications and illustrated in drawings, the applicant is not entitled to cover all claims and monopolize every way of securing the same result, for as was said in *Electric Signal Co. v. Hall Signal Co.*, 114 U. S. 87 (1885), where Mr. Justice Matthews said, p. 96:

> "But this result or idea is not monopolized by the patent. The thing patented is the particular means devised by the inventor by which that result is attained, leaving it open to any other inventor to accomplish the same result by other means."

To the same effect is *Willett Mfg. Co. v. Root Spring Scraper Co.*, 55 F. (2d) 858 (C. C. A. 6, 1932), and was followed in *Cleveland Tractor Co. v. International Harvester, supra.*

That a claim cannot be taken by itself, but must have a clear foundation in the specification, is affirmed in *Permutit Co. v. Graver Corp.*, 284 U. S. 52 (1931), where a claim was held invalid because there was no basis to show the construction. The structure of the Gulick application and the patent as shown by the evidence in this case, cannot be said to have been a further improvement upon the 1911 and 1914 pistons, for Gulick was not then entitled to put a preferred embodiment in his application and immediately proceed to cover everything for securing the same result, for the Supreme Court has said that cannot be monopolized.

The Sterling pistons, particularly Ex. CCC, apparently approach more closely to the Gulick 1911 and 1914 pistons than does the structure of the Gulick patent. The Sterling pistons have gone into use, while there is no evidence that the structure of the Gulick patent was ever generally used, so that it can hardly be said that the structure of the Gulick application can be considered an improvement over the Gulick 1911 and 1914 pistons.

In another view plaintiff overlooks the fact that the Gulick 1911 and 1914 pistons were specific things as distinguished from what is disclosed in the Gulick application and patents. These pistons, after being tried out to Gulick's satisfaction in 1911 and 1914, and plaintiff is here bound by Gulick's statement, were scrapped and so thoroughly discarded that they do not appear again until November, 1922, over a year after the Long patent 1,395,441 has issued. It would seem that proof of the abandonment of an inchoate right cannot be restricted by

showing the abandonment of things, such as pistons. The reason of such a rule is illustrated by the rule that restriction of a patent may be established during the prosecution by cancellation or amendment of claims, and the leading case is *I. T. S. Rubber Co. v. Essex Co.*, 272 U. S. 427 (1926), referred to hereafter on the question of infringement. Defendants urge that this case is only as to a file wrapper estoppel, but the reasoning seems applicable to the situation presented here.

When Gulick abandoned the 1911 and 1914 piston constructions, actually (as well as by public use), he could not thereafter include them by implication in his November 30, 1917 application. He did not include them, and there is no testimony that he ever told Tibbetts, the Packard attorney who bought the application, about them, and Tibbetts did not include them in the application, for as late as December 24, 1921, the drawing of the application was included in Gulick's affidavit.

GULICK PATENT VALIDITY AS AFFECTED BY MATERIAL CHANGE IN THE SPECIFICATION.

Defendants urge that the specification as filed was changed to something totally different from the original disclosure. This change was made nearly five years after the filing of the application, after pistons embodying the changed construction had been on the market and in public use for five years before the change was made. The adverse decision in the Hartog-Pomeroy interference seems to have been the moving cause for the change.

The original specification states that it "provides an extremely rigid construction," (Ex. 4-L, p. 1839) and five years later the amendment is that the webs or flanges were yielding in character, which was featured as a distinction over Spillman & Moores and Chenard & Walcker. Flexibility of the webs is nowhere mentioned in the original claims, directly or indirectly. Flexibility is relied upon by plaintiff to make out infringement (Tr. pp. 228-9).

Defendants urge invalidity of the Gulick patent, claiming such effect of the amendment to the specifications and claims, since flexible construction of the web is there shown for the first time, and further, that the Gulick patent fails to describe in the specification the metes and bounds of the construction having the required flexibility.

While the decisions of the Patent Office in the several piston cases were affirmed by the Courts on appeal, such

decisions now appear to have been founded upon a misconception of Revised Statute 4888, as were prior decisions of the Federal Courts which were overruled by the Supreme Court in the recent *Permutit Co. v. Graver Corp.*, 284 U. S. 52 (1931). That case involved the lack of disclosure and definition in patent specification and claims as issued. Its decision is based upon a construction of R. S. 4888, which applies to the disclosure and definition in the specification and claims of a patent as filed, as well as to one as issued. Of this statute Mr. Justice Brandeis said, p. 60:

> "The statute requires the patentee not only to explain the principle of his apparatus and to describe it in such terms that any person skilled in the art to which it appertains may construct and use it after the expiration of the patent, but also to inform the public during the life of the patent of the limits of the monopoly asserted, so that it may be known which features may be safely used or manufactured without a license and which may not."

That case had to do with filter beds, and a question arose if a "free" bed might have been valid, but that sued on was invalid for lack of disclosure as prescribed by R. S. 4888. There was no mention in the specification of either "free" or a "locked" zeolite bed, and the court said as the patentee had failed to give in the specification a written description, and had likewise failed particularly to point out and distinctly claim the free zeolite bed, as "the part improvement or combination which he claims as his invention or disclosure," that the patent was void.

The court reviewed the previous decisions on that patent, and the attitude of the courts, including the decisions of the 6th Circuit, 13 F. (2d) 454, 37 F. (2d) 385, and said that such views rested upon misconception, concluding, p. 60:

> "Moreover, while drawings may be referred to for illustration and may be used as an aid in interpreting the specification or claim, they are of no avail where there is an entire absence of description of the alleged invention or a failure to claim it."

The rule of this case has since been applied by the 6th Circuit Court of Appeals in *Bettendorf v. Ohio Steel Foundry*, 56 F. (2d) 777 (1932), affirming his Honor, Judge Hahn, of this District. In that case the alleged feature of the patent was the location of journal bosses

of a railway truck, and this had not been set forth in the claims nor described in the specification. The patent was held invalid as within the prior art. To the same effect are the recent cases *of Anchor Cap & Closure Corp. v. Linhardt*, 56 F. (2d) 542 (8 C. C. A., 1932), involving a jelly jar and cap, and *Helfrich v. Solo*, 59 F. (2d) 525 (7 C. C. A., 1932), where was involved a patent on a cosmetic compact which did not disclose information as to the ratio between kaolin and chalk and the court found that the alleged inventor had failed to disclose in his specifications or claims the novelty on which he relied, and the patent was held invalid.

In view of the statute, neither the specification as filed nor the specification as issued in the case at bar is a compliance therewith. There were no metes and bounds fixed in the Gulick structure, and plaintiff must fail if inherent flexibility is relied upon, as was done in the Patent Office, for both the Spillman & Mooers and the Chenard & Walcker patents meet that issue; and plaintiff having acquiesced in the position of the Patent Office, said that it was within the field of mechanical skill to split the skirts, while the Commissioner seems to have been misled as to the inherent flexibility of the Spillman & Mooers structure as shown by Ex. 3-P, and of the Chenard & Walcker patent as shown by the Ray Day piston.

Plaintiff's counsel rely upon the Supplemental Oath by Gulick as curing any defects in his applications. Such oath is unavailing in the presence of contradicting facts such as are shown in this record, as was said in *Steward v. Ellis v. Lee v. Howe*, 1889 C. D. 243, p. 248:

> "The supplemental oath, in cases where it is effective for any purpose, simply enables the applicant to cover and include in his claim such portion of his original disclosure or description as was not embraced 'in the statement of invention or claim originally presented.' It cannot be permitted in any case to justify such a change as would require an alteration in the date of the application as a completed application."

This rule applies in reissue cases where the reissue application must be supported by an oath. Here the fact that the Patent Office allowed the amendment to be filed is not controlling, for someone might have been mistaken, as seems to have been the fact in the proceedings in this case.

MOOERS PATENT VALIDITY AS AFFECTED BY ATTEMPT TO BROADEN ORIGINAL APPLICATION AND MATERIAL CHANGES IN THE SPECIFICATION.

Defendants urge much the same situation as to the Gulick application is presented as to the Mooers application, where the specification was changed three years after its filing date. Here the attempt was to incorporate the so-called Mooers principle more than two years after the Long piston was on the market, to say nothing of Kant Skore, Maxwell and Jardine.

The Mooers principle is compensation for expansion by mechanical distortion of the skirt, as testified by Dr. Jeffries who would apply it with many ramifications to all Sterling pistons except Ex. 3-J; this was not embodied in the Mooers application as first filed, and first appeared in the amendment to the Mooers specification filed January 4, 1921. After the Mooers patent was assigned to the plaintiff this "Mooers principle" of operation was discovered, and in the meantime the Ricardo patent had been granted, the Long pistons had gone into widespread use, and the art had become familiar with the slipper piston of the Ricardo type (Ex. 3-S) when the application for an amendment of the Mooers application was filed (Def. Ex. 4-L-1, p. 2000). This Mooers principle, therefore, is on the same footing as to the Mooers patent as the flexibility of the Gulick patent, and the reasons heretofore given for finding the Gulick patent invalid because of the extension of the Gulick disclosure apply equally to the Mooers patent which is also found to be invalid.

VALIDITY OF PATENTS OVER PRIOR ART.

Having considered defendants' claims that the Franquist patent was a combination including all that was in the prior art, the next step is to consider the five patents in suit in the light of the prior patents and publications, in addition to the Franquist patent.

GULICK PATENT AND PRIOR ART.

The inquiry is as to the standing of the specific Gulick piston shown in the drawing and described in the specification. The Gulick patent structure comprises a head isolated from the skirt by a circumferential gap extending around the piston below the lower ring land, which is accomplished by connectors extending from the head to the skirt and carrying the wrist pin bosses. Such

connectors are attached in Fig. 1 to the skirt at points just below the wrist pin bosses and then down to near the bottom of the skirt, which attachments above that point are merely longitudinal ribs which have no effect on web flexure. (Stellman, Tr. pp. 530-1, Jeffries, Tr. p. 163.) The skirt is slit in the region between the wrist pin bosses and the structure is such that the webs will flex, although the original specification stated (Ex. 4-L, p. 1838) "the above described construction also provides an extremely rigid connection between the wrist pin bosses and the skirt of the piston."

Defendants urge that this specific structure was not patentable to Gulick, regardless of any extension of supposed patent monopoly, to cover the Sterling and Ray Day pistons.

Franquist has a disclosure of a piston which is adapted to have a snug, sliding fit in the cylinder when cold, which upon expansion of the piston, automatically yields sufficiently to prevent its sticking in the cylinder; and the partial isolation of the head from the skirt, as accomplished in the Sterling pistons; and thus the sole distinction is that in place of provision for contraction by partially slotting the skirt vertically, in Gulick the vertical slotting is all the way through the skirt, and specifically, there is a single slot midway between the wrist pin bosses and connecting with the vertical slot.

Apparently the placement of the slot exactly in the center was not a criterion as far as the Gulick patent was concerned. (Jeffries, Tr. p. 175.) Slotting through piston skirts was not only old, as shown by the Ebbs patent of 1902, the Van Bever, Bainforth and Serex patents of 1912 the Vincent patent of 1913, and the Schoengarth patent of 1915, but there is also a cutting through of the vertical slot in the Long patent of 1918 and 1919, the Spillman patent of 1919, the Hives and Jardine patents of 1920, the Maynard patent of 1921, and the Ray Day application of 1923. In this connection there is the piston ring which is slit through, admittedly ancient by the experts (Jeffries, Tr. pp. 94-6, and Stellman, p. 477), and the ancient use of expansion joints. Stellman considered slotting no particular trick (Tr. pp. 480-1) when he made Ex. B at Franklin in 1916, and he did that when ignorant of the Van Bever patent (Tr. p. 583).

Plaintiff's claim covering a T-slot to a trunk piston was allowed in an interference with claim 10 of the Long patent 1,395,441, which was allowed to Gulick as

claim 13 (Defendants' Ex. 4-F). Thus neither Long nor the Patent Office could dispute its validity, which was afterwards affirmed by the Court of Customs and Patent Appeals. The hands of the Patent Office were thus tied in which is now urged to be an unpatentable subject-matter, and the Patent Office was in no position to controvert this after the grant of the Long patent.

Considering also the connections from the head to the skirt, the only difference between Gulick and Spillman & Mooers is that the connection in Spillman & Mooers is made at the bottom of the skirt and in Gulick the attachments are along the skirt; and this the Law Examiner held to be no patentable distinction (Defendants' Ex. 4-E). It is urged by plaintiff's counsel that Spillman & Mooers' patent structure has not gone into commercial use, although it is one of the patents relied upon as infringed in the *Simmons* case, *supra*.

The same situation arises from the Chenard & Walcker patent as the Spillman & Mooers, for the Law Examiner (Ex. 4-C) uses either patent as a basis, and held it involved nothing but mechanical skill to split the skirt.

As against the Gulick patent, the defendants claim:

(1) That Spillman & Mooers showed the separation of the head from the skirt, which was all that was required in a cast iron piston, and that Spillman & Mooers, before its expiration, was relied upon by plaintiff as covering the accused device (Ex. 1).

(2) That Franquist contributed the separation of the head from the skirt, slotting the skirt longitudinally to obtain a piston having a snug, sliding fit when cold, which upon expansion of the piston when hot would automatically yield sufficiently to prevent sticking; this patent was also relied upon by plaintiff before its expiration, sued upon and royalties collected.

(3) That the Franquist invention gave a broader idea than the later Gulick patent, i.e., in addition to the isolation of the head from the skirt, the head is diametrically reduced to the circumferential slots and the reliefs in the region of the wrist pin bosses extend from bottom to top so as to merge into the diametrical reduction of the head with the slots.

(4) That splitting through the skirt of the piston vertically was practiced from 1902 to 1923, and T-slots came in 1912.

(5) That the decisions of the Patent Office held that it involved nothing but mechanical skill to split the skirts of Spillman & Mooers and Chenard & Walcker and to arrange the webs as in the Gulick patent.

Gulick claimed rigidity of his piston, yet as Associate Judge Bland said in the patent appeal of *Hartog v. Long*, 47 F. (2d) 367 (1931), "that Hartog's piston skirt has more flexibility than Gulick's, and that the elements responsible for such flexibility in Hartog differ materially from the elements responsible for it in Gulick cannot be denied." The court denied the Hartog claim on the ground that he sought to read into the count things suggested in the specification, but not embraced within the language of the count. The court then goes on to say that it seemed clear if the slot of the Gulick piston takes care of expansion, it is by reason of its flexibility, and finally awarded Gulick the claim. The court then concludes that Gulick should be regarded as prior inventor of the subject-matter, if he had the right to make the claim which was not denied in that court. The pertinency of that language here is that in this proceeding there is denial accompanied by proof that Gulick has both abandoned and is not the prior inventor of a piston with a skirt that flexes or yields.

The legal question is thus presented regardless of the decisions in the Patent Office acquiesced in by plaintiff, does it involve invention on the part of Gulick to take old pistons such as Spillman & Mooers or Chenard & Walcker and split the skirts of those pistons in the region of the wrist pin bosses?

Invalidity or Lack of Invention.

Where the patentee had gone to another art to supply an expedient, it was not held to be a departure, and hence not invention. In the present case Gulick stayed in the same art, namely, pistons. In *Crown Cork & Seal Co. v. Sterling Cork & Seal Co.*, 217 Fed. 381 (C. C. A. 3, 1914), was involved a patent for automatically sealing bottles by forcing a cap thereon. A previous patent granted on the same application of the patentee had partially solved the problem, which provided a yielding connection between the Pitman and the plunger engaging the cap to force it on the bottle. That situation corresponds to this, in that the skirt of the Franquist piston is later slotted so as to be permitted to contract when the piston gets hot. In that case the plaintiff relied upon an im-

provement, and the applicant having gone to another art, substituting a yielding arrangement upon the previous patent, and of this Judge Denison says, p. 385:

> "The conception which lay at the bottom of plaintiff's 1898 patent, viz., that he could go to the yielding plunger art, or to some specific art, and adopt a yielding plunger as an element of a bottle-sealing machine, was a meritorious conception. It may have entitled him to a broad monopoly upon any use of a yielding plunger in that association (as was apparently secured to him by the first claim of his 1898 patent)."

He then continues in discussing the situation before the court, p. 385:

> "That question is not before us, and we do not mean to intimate any opinion; but, however that may be, having had this conception on 1898 and having received a patent, he could not have another patent in 1899 which would do more than cover the improvement which he then discovered."

Judge Denison then states the reason for the unsoundness of such a procedure as follows, p. 385:

> "Having gone into the yielding plunger art, and adopted and adapted the hydraulic cylinder yielding plunger into and for a bottle-sealing machine, and having thus bridged over whatever gap there was between bottle-sealing machines and yielding plungers, and having thus incorporated the two arts together, he could not the next year adopt a mechanical trip-yielding plunger to bottle-sealing machine use and then get a valid patent covering any kind of a mechanical trip-yielding plunger when used in a bottle-sealing machine. Yet this is, in effect, his present position, and must be his position to succeed. There remained open for his 1899 patent only his adaptation, not his adoption."

He then quotes with approval the decision of Judge Killits in the District Court as follows, p. 385:

> "'But, when Painter patented the mechanism alleged to be infringed in this case, the art of bottle-sealing by crowns had already invaded the art of yielding pitman, of which the known forms were many, and had made an appropriation therefrom.

> Whatever may be the merits of his invention, we find nothing in his grant which shuts the door of opportunity to some other inventor to go to the yielding plunger art for an old device of this character'."

While it is elementary that invention may reside in a combination of elements which were theretofore separately old in the art, in order to sustain such combination the inventor must do more than make a judicious selection from the devices of the prior art. Merely doing this, as said by Judge Hickenlooper in *Newcomb, David Co. v. Mahon Co.*, 59 F. (2) 899 (1932) at p. 901, "is the exercise of mechanical skill reasonably to be expected in the development of the art, and has repeatedly been held insufficient to evidence invention, whether such decision be placed upon the ground of aggregation or upon the lack of an exercise of an inventive faculty," citing *Concrete Appliances Co. v. Gomery*, 269 U. S. 177 (1925). In another decision by Judge Hickenlooper, in *Bettendorf Co. v. Ohio Steel Foundry Co.*, 56 F. (2d) 777 (C. C. A. 6, 1932), the court said, p. 778:

> "It would require no exercise of the inventive faculty merely to combine these desirable and well-known elements of the prior art structure—especially under the stimulus of newly adopted standardization requirements."

And further, p. 779:

> "But, after all is said and done, there still remains the question of fact whether the patent discloses an exercise of the inventive faculty, in view of the state of the art, or merely mechanical skill; and the question of law, whether the claims properly protect the patentee in the invention which he has really made."

While it is within the province of the court to decide this case on the ground of non-infringement, as was the result in *Crown Cork & Seal Co. v. Sterling Cork*, supra, the facts here seem to warrant going further and holding that the claims on the Gulick patent are invalid as in the last case cited. Other cases to the same effect in this Circuit are *Oil Conservation Engineering Co. v. Brooks Engineering Co.*, 52 F. (2d) 783 (1931), *Sands Mfg. Co. v. Smith*, 53 F. (2d) 459 (1931), and *Rhame, Inc. v. Sparks-Withington Co.*, 58 F. (2d) 583 (1932). The Supreme

Court early so held in a case, *Thatcher Heating Co. v. Burtis*, 121 U. S. 286 (1887), involving the use of the old fuel magazine in a particular base burner, where Mr. Justice Matthews said, p. 294:

> "When this fuel magazine was thus transferred from one kind of stove to another, in its new situation it performed precisely the same function, with respect to the fuel and the fire, as it had always been accustomed to perform in its old place * * *"

and this was followed in *Thomson Spot Welder Co. v. Ford Motor Co.*, 265 U. S. 445 (1923), where the Supreme Court approved the language of the Court of Appeals of this Circuit, and said, p. 451:

> "Although invention is not necessarily negatived by the fact that each element of the combination is old, the question of fact whether the combination itself involves invention in view of the prior art is always present."

A recent holding of lack of invention appears in *Naivette, Inc. v. Bishinger*, 61 F. (2d) 433 (1932), where a re-issue of patent to Decker on permanent waving had been held valid and was reversed by the 6th Court of Appeals, Simons, Judge, saying at p. 437:

> "We fail to see invention in Decker. He combined old elements, but manifestly in such a way as must have been obvious to anyone skilled in the art, and the combination produced no new result. If what he did marked any improvement in the art, it solved no real problem and answered no recognized need, and such advance, if any, as was achieved was altogether too trivial to rise to the dignity of invention. *Seymour v. Ford Motor Company*, 44 F. (2d) 396."

Jardine Patent and Prior Art.

The inquiry is as to whether the specific structure shown in the Jardine patent amounts to invention in view of the prior art. Defendants urge that plaintiff takes another type of piston, a slipper piston as shown in Jardine, being specifically that of the Ricardo patent No. 1,294,833, and upon this would uphold another patent for a split slipper piston.

Testimony at the hearing showed that Jardine is also the basis of Maynard, and that to Jardine Maynard

merely added an oil wiping ring at the bottom. The testimony showed that Jardine knew of the Ricardo piston and its development; that it was tried out by the Aluminum Company of America, and plaintiff's expert produced a Ricardo piston on rebuttal. An exemplification of Ricardo piston was shown in the publication of "Automobile Engineer" in 1918 (Ex. 3-S), which piston had been tried out by plaintiff, so that there is no basis for surprise in this proof which was not pleaded in the answer. Comparison of the Jardine and Ricardo pistons shows that both are slipper pistons, being distinguished in that Jardine split both slippers, which practice was known to the prior art from Ebbs in 1902 to Long in 1919.

The webs of Ricardo are thinned down, which plaintiff claims was already done by Gulick in his patent disclosure. While the webs of Ricardo are thinner than those in the Jardine patent, the difference seems to be one of degree. The isolation of the skirt from the head goes all the way around as in the Spillman & Mooers and Chenard & Walcker patents, and as in Franquist considering the slot as going all the way around as a part passes through the air. The form of the slippers of Jardine are appropriated from Ricardo in making one slipper longer and wider than the other. There was considerable evidence that the Jardine piston is simpler, lighter and cheaper than Gulick, which is due to its being a slipper piston. The statement of plaintiff's expert that Jardine was the first single wall piston to flex overlooks Franquist in view of the tests and the testimony in this record. Jardine pistons were never sold, have never gone into commercial use, although plaintiff's expert says that the Ricardo piston was used in Europe. Plaintiff's claim is that Jardine was followed by Maynard, a better piston, which was developed by Maxwell.

The Jardine piston seems to be invalidated by the Ricardo piston which was known to Jardine when he started to work on it, and the slitting of the slipper piston of Ricardo by plaintiff's assignee, as Gulick had done with the Spillman & Mooers piston, fails to show any inventive effort. The discussion of the authorities in *Crown Cork & Seal Co. v. Sterling Cork*, *supra*, and the cases there cited, are to the same effect.

Before Jardine filed his application, the Long piston was on the market for perhaps three years. Long's application for patent No. 1,872,772 was in interference with Jardine, involving claim 5 of the Long patent, the

decision was adverse to Jardine, so the Jardine patent if valid is valid to cover only the exact invention disclosed, for the Jardine claims relied upon are invalid in view of the Long pistons, the applicable rule of the patent law being that which if later will infringe if earlier will anticipate. The claims of the Jardine patent relied upon are invalid in view of the Long pistons.

MAYNARD PATENT AND PRIOR ART.

This inquiry is as to the standing of the specific Maynard piston shown in the drawing and described in the specification. Besides the patent stating that this invention relates to pistons, Maynard says (p. 1, l. 2) that the patent "has for its object the prevention of the 'pumping' of oil and the 'freezing' due to excessive expansion."

Defendants urge that through Maynard plaintiff is attempting to monopolize the application of the same old split piston with its dashed-in relief, with its head diameter reduced, and with an oil groove, all claimed to be old in the art. Defendants are not limited to the dashed-in relief, for plaintiff contends that the other Sterling pistons with relief (Exs. BBB and CCC) come within the scope of the Maynard patent.

Maynard admits the employment of the old expedient of longitudinally slotting a piston skirt, in the specification (p. 1, ll. 16 *et seq.*), and would add thereto an oil groove between the piston ring portion and the skirt portion which is called "a continuous annular groove." A smaller recess for the "film of oil around the piston" was described in the Howe patent 908,569, and which use had been followed by licensee of that patent (Tr. pp. 1067-8). The slotting described in the Maynard patent was in quadrants, leaving one-half of the groove in the air, and the only language of the patent about the web structure and splitting which is claimed to be equivalent to a relief, is p. 1, ll. 60, *et seq.*, concluding:

> "Thus there are formed recesses H surrounding the bearings G with segmental skirt portions on opposite sides thereof and an annular skirt portion below said segmental skirt portions,"

and with reference to function they have stated as follows:

> "Any oil accumulating in the recesses H will follow down the webs F and there is no chance at any

point for the accumulation of oil adjacent to the rings."

Any reference to flexing of the skirt is omitted from the Maynard patent. Claim 6 is for a combination of a head, webs, a skirt integral with said webs "relieved adjacent said webs to a point between the bosses and the end of the skirt," and circumferential and longitudinal slots. The reliefs are not dashed-in but are similar to the reliefs of Franquist. Nowhere in the patent is there any statement about Keystone relief, found necessary to make function commercial pistons like Exs. 1 and 17.

The plaintiff's expert testifies that Maynard is a commercially successful piston, combining a number of features (Tr. pp. 77, 121-2). Maynard does combine a number of features, namely, a trunk piston having the expedients of the prior art, to which has been added in practice a Keystone relief not disclosed in the Maynard patent. Defendants claim that without such Keystone relief the Maynard piston is not a commercial success, and the proof offered by plaintiff that the Maynard piston operates successfully without the relief is not convincing.

Maynard was on notice as to what preceded him, for there was the Jardine piston and the Long piston. Plaintiff's expert testifies that after the test of the Jardine piston on a Maxwell car, Maynard being Chief Engineer of the producing company, "this Maynard development came along * * * and the Maynard piston is the one that was adopted in the car." (Tr. pp. 131-132.) Plaintiff's expert says that Maynard is like Jardine except that the skirt is completed at the bottom and Maynard added the old oil wiping ring (Tr. pp. 77, 137) which was shown in the Schoengarth and Roots British patent, that Maynard went back to Schmiedeknecht, for both Maynard and Schmiedeknecht followed the Ferry British patent, that the Maynard piston is like the Jardine from the boss up, and like Schmiedeknecht from the boss down; and finally that the commercial piston (Ex. 17) is like Jardine from the boss up and like Gulick from the boss down, and differs from the unslotted Ricardo in that Maynard has a wiping ring at the bottom.

Coming to the operation of the Maynard piston, it appears that the top was not sufficiently flexible to compensate for all expansion, which is secured in the commercial piston (Exs. 1 and 17) by the Keystone relief not shown in the patent. While two rough castings were

produced without the Keystone relief, the record shows that after the filing of the Maynard patent application, change was made to give the Keystone relief (Ex. 22). So the piston before the court is the piston of the Maynard patent which is without the Keystone relief. A significant fact is that Chrysler abandoned the use of the Maynard piston although owning a half interest in the Maynard piston (Tr. p. 130). The Franquist piston is a complete answer to the Maynard piston, for it shows the structure, function and mode of operation of the Maynard patent, as is the Long patent 1,395,441 which was tested by plaintiff's witness, Burns, at Franklin as early as 1918, and Stellman says (Tr. p. 525) that all Maynard did was to put the T-slot of Long on the piston of Schmiedeknecht.

Finally it must be said that plaintiff cannot even rely upon an alleged copying of the Maynard piston by defendants, in view of the failure of the patent to disclose an essential feature necessary to make it work, that is, the Keystone relief, for as said by Judge Hickenlooper in *Bettendorf v. Ohio Steel Foundry Co.*, 56 F. (2d) 777 (C. C. A. 6, 1932), at p. 779:

> "Clearly if the claims as stated fail to disclose a patentable invention, no license is required, the device may be used and made by anyone."

The Maynard patent represents a collection of old expedients, each employed in the usual capacity, which the courts have consistently refused to recognize as a patentable combination. Similarly, a valve patent was recently held invalid in *Central Brass Mfg. Co. v. Republic Brass Co.*, 63 F. (2d) 287 (1933), where Judge Hicks said, reversing His Honor Judge West of this District, p. 289:

> "Spaced interior partitions with aligned ports, angular passages, and hollow sleeves having lateral ports communicating therewith are all admittedly very old in valves relating to the plumbing art. Bloch was chargeable with knowledge thereof, and we think that the introduction of these elements into his combination was an obvious one. Acting upon his knowledge, skill and experience, he simply took another step in the evolution of the bathtub and shower art. He produced a cheaper, more compact, and perhaps a more convenient valve; but we do not think that his achievement was the result of the exercise of the inventive faculty."

Mooers Patent and Prior Art.

As to this patent, a similar situation is presented as to the three preceding patents. Plaintiff owns the Spillman & Mooers patent; in fact, the Spillman & Mooers patent was the foundation of the original trust agreement, to which was added this Mooers patent. Under Spillman & Mooers, royalties were collected until its expiration, and it was one of the patents in the suit of *Cleveland Trust v. Simmons Mfg. Co.*, hereinbefore considered. Following the expiration of the Spillman & Mooers patent it is now disowned by plaintiff as being impractical.

Mooers states in his specification (p. 2, ll. 99 *et seq.*) that the construction of the piston embodying his improvements may be carried out in permanent molds, which was not true of a construction for the old patent, and that he had in mind the use of permanent molds in the design of his improvement. When the Spillman & Mooers patent was issued in April, 1914, the patent molding process had not been developed, so that with the advent of permanent molds there was a requirement of ready extraction of the core from the mold. Plaintiff's expert admits this particular piston never went into commercial use (Tr. p. 114), that it was not satisfactory (Tr. p. 107), has no skirt flexibility, is inferior to the construction of Gulick and Jardine, and claims for the patent that it discloses relief adjacent to the bosses and permits mechanical distortion and was the first to compensate for heat by distortion.

The Spillman & Mooers patent seems to be a complete answer to this Mooers patent, for Mooers went back to the construction of Franquist by having the connection of the head to the skirt raised and eliminating the attachment made at the bottom of the skirt. This was a compromise between he efficiency of heat transmission and efficiency of operation, and a similar practice was said by the Patent Examiner in the Gulick interference (Ex. 4-E, pp. 1661-1662) as requiring no inventive effort.

Plaintiff urges that the claim reaches the Ray Day piston for the connection is from the head to the wrist pin boss, and urges that the Ray Day piston thus infringes the Mooers patent. Neither the patents of Spillman & Mooers or the Chenard & Walcker patents show reliefs in the region of the wrist pin bosses, although prior to both, pistons had been relieved in the region of the wrist pin bosses. Relief was accomplished by oval

grinding, as now shown in the Plymouth piston (Ex. 3-O), and which expert Stelhman says is described in the Chenard & Walcker patent. So the question arises, if reliefs in the region of the wrist pin bosses by oval grinding was not sufficient, and separation of the head from the skirt was not sufficient, does it constitute invention to use both features in one piston, which seems to be what has happened with the Ray Day piston as regards the Mooers patent.

On the basis of the authorities heretofore cited, such combination cannot be invention, for the next might combine separation of head from skirt with oval grinding and simple relief; another might add a tapering of the skirt, to say nothing of other combinations which might be offered.

Considering the Sterling piston, the Franquist patent is a complete answer to Mooers, as is the Gulick 1914 piston (Ex. 51), except the two connections inside the piston and the absence of relief opposite the wrist pin bosses, which Gulick carefully said his early piston did not have.

Plaintiff having made reference to the Mooers patent a clear issue in this case, by contending that the accused devices infringe, and from the constructions it appearing that as far as the Mooers patent is concerned the accused devices are in the public domain, the claims of the Mooers patent relied upon as infringed are found to be invalid and void.

Schmiedeknecht and Prior Art.

This patent was acquired by the plaintiff after several transfers from the Bohn Aluminum & Brass Corporation for an interest in the trust estate. Ex. 1 is the only accused device as to this patent. With the advent of aluminum and the consequent difficulty of securing a proper fit, this invention is put forward as a light weight cast iron piston, apparently to obviate the difficulties arising from aluminum pistons (p. 1, ls. 35-46).

The specific construction of the patent provides a piston in which the weight is reduced by cutting holes in the side walls, and would replace the previous practice of mounting wrist pin bosses on the side walls by the use of ribs or webs. To obviate the necessity of thickening the walls of the piston, Schmiedeknecht proposes webs on the inside of the piston and supporting the bosses each at one end from the web and at the other end from the head (p. 1, ls. 97-107, p. 2, ls. 4-12).

Ex. 1 does not employ the Schmiedeknecht construction but supports the wrist pin boss intermediate its end. The construction of Schmiedeknecht is exemplified in the prior art by the Pugh British patent, where each boss is supported at its end from a cross-web extending to the head of the piston. Also, the Ferry British patent more nearly approached Ex. 1, for there the bosses are wholly supported by cross-webs.

Here again Ex. 1 follows the prior art more closely than it does the Schmiedeknecht construction. Plaintiff makes the issue by contending that a construction in which the boss is supported intermediate its ends, is the equivalent of a boss supported at the ends, and in view of the prior art, the finding is that the Schmiedeknecht patent is invalid and void.

PRIOR USES.

To establish prior use, defendants offered evidence of pistons made and used by Monckmeier in his racing cars as early as 1911, the pistons made and sold by Schoengarth in 1915, and the pistons made and sold by Long before May, 1916. If established, such prior uses by Monckmeier and Schoengarth constitute a statutory bar against the plaintiff's claim on the Gulick patent. Prior uses as affecting the other patents in suit is also to be considered.

Monckmeier Pistons.

Defendants offered in evidence proof of the existence of the Monckmeier piston from 1911 to 1916, producing the two pistons involved, a cast iron piston (Ex. 3-D) and an aluminum piston (Ex. 3-W). Monckmeier is a business man now engaged in the manufacture of tools and automobile appliances, and when racing Staver cars, slotted and used the pistons produced at the trial. Three additional witnesses were called, a mechanic who did machine work for Monckmeier on the 1911 piston, another now in the automobile repair business, who helped Monckmeier put the 1915 pistons in his car before the Elgin race when they were first used, and another in the manufacturing business in Chicago, who helped Monckmeier install the aluminum piston in his car in the early fall of 1914, before the Iowa City race and again saw the pistons before the Anamosa race of June 10, 1915. These witnesses were wholly disinterested, none were in the business of marketing or producing pistons, and by his

own use, Monckmeier is barred of securing any patent rights.

Monckmeier testified he had the cast iron piston in his possession since 1912 after he had slotted it at Peoria, and had the aluminum piston since 1914. Both were used in races of which he testified, and to corroborate, magazines and newspapers were produced, checking the dates and showing that he competed in the races as he had orally testified, in several of which he won prize money.

After the recess plaintiff brought other witnesses who had known Monckmeier and of his racing, and whose testimony varied in details but in no substantial way discredited the facts as to Monckmeier's manufacture and use of the pistons in the races on the dates before established.

The construction of these old pistons is established by their production and offer in evidence, so there is no question about relying upon oral recollection as to the nature of such construction, such as was considered in the *Barbed Wire case*, 143 U. S. 275 (1892). In that case the court said that "the proof shall be clear, satisfactory and beyond a reasonable doubt," and recently the Supreme Court, in *Eibel Process case*, 261 U. S. 45 (1923), Mr. Chief Justice Taft said, at p. 60, "that the evidence to prove prior discovery must be clear and satisfactory," but in each of these cases no original device was produced. Here not only are produced the original pistons described by three corroborating witnesses, but the dates of use are checked by public documents, newspaper and magazine articles, together with a record of a private contract.

A similar question was presented in *Cleveland Tractor v. International Harvester*, Equity No. 3860, where the decision of this Master was affirmed by his Honor, District Judge Jones, on March 25, 1933. The same authorities there cited are pertinent here, for there was involved a power take-off mechanism which had been used on a tractor in 1910, some three years prior to the application for the Strait patent. What was said in that case is quite in point here, and the following is from pages 37 and 38 of the Master's report:

> "The courts have not forbidden the defense of a prior use in a patent case or the proof of such use by a paroled evidence. The question in each case is one of fact to be decided, whether the evi-

dence which has been produced by the defendants proves the existence of the alleged prior use. If the device is simple, if the witnesses are apparently honest, if the circumstances are such as to have properly impressed the event upon their minds and memory, and particularly if they are familiar with the subject matter of the alleged invention, such prior use may be established by parol evidence. An early case discussing the evidence of prior use and hold a patent invalid is *Sipp Electric & Eng. Co. v. Atwood Morrison Co.*, 142 Fed. 149, where a discussion of such evidence appears at pages 153-5."

"Cases of prior use are summarised and discussed in *Haggerty v. Rawlings Mfg. Co.*, 14 F. (2d) 928; which involved a patent relating to guards or pads for use in football suits. The evidence of prior use was the verbal testimony of four witnesses that it was common custom to make devices similar to the patented invention prior to the application for patent. Other cases, *Chrone v. John J. Gibson Co.*, 247 Fed. 503; *Lee v. Upson & Hart Co.*, 43 Fed. 670; *Rochester Coach Lace Co. v. Schaefer*, 46 Fed. 190; *Groupe Drier & Boiler Co. v. Fiske Geiger, et al.*, 215 Fed. 110."

"Upon the strength of parol testimony of a prior use a patent for disk plows was held invalid in *Linville v. Milberger*, 29 F. (2d) 610. As to such use of the implement, Judge McDermott said (p. 617):

> 'but, no one, I believe, can read the evidence of these seventeen persons, with their wealth of homely methods of fixing the dates with checks and bank records supporting the story, with different witnesses identifying one part of the plow he had fixed and another witness another part and have any vagrant suspicions that they are perjurers. In short, the evidence meets the exacting standards required and is supported by the appearance of the plow itself'."

This last case was affirmed by the Court of Appeals of the 10th Circuit, 34 F. (2d) 390 (1929), and in the opinion of Judge Phillips repeats with approval the above language as to prior use establishing the defense of invalidity.

Plaintiff urges that the pistons of the patents in suit are for use on pleasure cars and that Monckmeier's use on a racing car was simply an experimental use. The Supreme Court did not accept such a view in the famous corset case, *Egbert v. Lippmann*, 104 U. S. 333 (1881), where only the fiancee of the inventor had used the device and this was more than two years prior to the application, which the court held to be a use and not an experiment.

Plaintiff urges that the use by Monckmeier amounted to nothing more than an abandoned experiment; that the Monckmeier use of pistons in 1911 is not to be considered an abandoned experiment is established in *Buser v. Novelty Tufting Machine Co.*, 151 Fed. 478 (6 C. C. A., 1907), where a small tufting machine had been used prior to 1886, was not used in 1886 and 1887, when the 2-year period began to run; the court held that it was immaterial whether it was used until during the eleven year period before the patent was applied for. If once used as a completed invention, that is enough in distinguishing between the public use of the statute and abandoned experiment, Judge Cochrane says, p. 492:

> "These two things are entirely distinct, and in argument the distinction between them is not clearly noted. In order that it may be, we will consider them one at a time in relation to said position. An abandoned experiment is an experiment that has been abandoned. As a mere experiment never amounts to anticipation, the epithet abandoned here is unnecessary. What constitutes an experiment is indicated by the language of Mr. Justice Swayne in the case of *Coffin v. Ogden*, 18 Wall. 120, 21 L. Ed. 821:
>
> "The invention or discovery relied on as a defense must have been complete and capable of producing the results sought to be accomplished. If the thing were embryotic or inchoate, if it rested in speculation or experiment, if the process pursued for its development had failed to reach the point of consummation, it cannot avail to defeat a patent founded upon a discovery or invention which was completed, while in the other case there was only progress, however near that progress may have been approximated to the end in view. The law requires, not conjecture, but certainty. If the question relate to a machine

as thus exhibited, the conception must have been clothed in substantial forms, which demonstrate at once its practical efficiency and utility.' "

And again:

> " 'Until his work is done, the invention gives nothing to the public.'
>
> "If, however, the machine or other thing is complete, and capable of producing the result sought to be accomplished, it has passed the experimental stage and becomes an invention; and, in order that it may constitute an anticipation, it is immaterial how well it becomes known or how much it is used."

Where a device was only used for two and one-half months this was sufficient "public use" to bar the grant of a patent to another filed more than two years later, *Brush v. Condit*, 132 U. S. 39 (1889) where one clamp and lamp device had been used in work in a mill at night, in and out of doors. Such use was not experimental, and Mr. Justice Blatchford said, p. 47, it did not seem to be for the purpose of testing the machine, of calling attention to its qualities or of gratifying curiosity, but was used to furnish light to workmen. Here Monckmeier used his piston in a car used to win races, for which he was paid money.

Even a limited use of a device is sufficient to bar a patent, as Judge Tuttle said in *Eclipse Interchangeable Counterbore Co. v. Gairing Tool Co.*, 33 F. (2d) 942 (1929), at p. 943:

> "What was done at Mansfield was not published, was not patented, and the amount that it helped the world, of course, was pretty limited. But so long as I find, as I do, beyond a reasonable doubt, that it was done, that it was used, and with mechanical success sufficient to bring it into the art, I am forced to consider it."

Plaintiff also urges that the Monckmeier pistons, constructed and slotted as shown in the exhibits, would not operate to satisfaction in the present day automobile, and of course no piston does that. The piston of the Gulick patent did not, nor would the Gulick 1911 and 1913 pistons, but what was embodied by Monckmeier and by Gulick in the 1911 and 1914 pistons is now open to the public, even if old devices might now seem impracticable.

They must be considered a prior public use of what they actually embody, regardless of their efficiency, if used in this day. The same question was before the Court of Appeals in *Motor Improvements, Inc. v. General Motors Corp.*, 49 F (2d) 543 (1931), also involving some five patents on purolator or oil filtering devices, where it was established that the old Royal Tourist car used an oil filter which was described as impracticable, still it was a prior use of oil distributing pipes and of undoubted efficiency, which feature Judge Mack held was good and constituted a bar to a subsequent patent on that particular feature. In the same way the T-slot expedient broadly claimed to be covered by the Gulick patent, was used not only by Gulick but by Monckmeier and Schoengarth more than two years before Gulick's application. To the same effect on this point is *Eclipse v. Gairing Tool Co.*, *supra*, and *Kil-Nock v. Chicago Plating Co.*, 10 F. (2d) 536 (D. C. Ill 1926), where Judge Lindley says, at p. 538:

> "When it clearly appears that a prior device is in all essentials the device of the patent, and in fact accomplished practical work and was put to ordinary use, anticipation is made out, though the anticipatory device did not operate as perfectly as that of the patent, and was not long kept in use. *Brush v. Condit* (1889), 10 S. Ct. 1, 132 U. S. 39, 33 L. Ed. 251; *Id.* (C. C. 1884) 20 Fed. 896."

Plaintiff urges the precedent of several cases in which the evidence of prior use has been held insufficient and sets up a yardstick as to how the proof in this case should be measured. The authorities offered present not an instance where the alleged device alleged to have been in use is offered in evidence by the prior user. In *United Shoe Machinery Corp. v. Day Wood Heel Co.*, 46 F. (2d) 897 (C. C. A. 6, 1931), and also *Union Trust Co. v. White Motor Co.*, 22 F. (2d) 898 (1927), although there was a signed and dated drawing, Judge Westenhaver pointed out that the other circumstances of the proof were such as to cast doubts upon the integrity of the drawings but also of the witnesses; and in *Universal Rim Co. v. Firestone Steel Products Co.*, 289 Fed. 884 (1923) urged by plaintiff, only oral evidence was submitted.

On the other hand, there is *Open Hearth Steel Furnace Co. v. Youngstown Sheet & Tube Co.*, 2 F. (2d) 94 (1924), where there was testimony of several prior uses

at different places, and Judge Westenhaver said, p. 97, "even if they are to be regarded as abandoned experiments rather than discontinued inventions, they should not be denied a place in the open hearth furnace art; each will be considered as a part thereof." Such situation is quite comparable to the facts of the present case, where the T-slot expedient has been shown to have been used by many persons other than Gulick, and including Moseknmeier, Schoengarth, Long and others, working independently and all resorting to the same expedient upon encountering expansion difficulties in their pistons.

Schoengarth Pistons.

Defendants offered in evidence the Schoengarth pistons, urging that this showed (1) the public use of that piston for two years prior to Gulick; (2) another use of the old T-slot expedient more than two years prior to the Gulick amendment of September, 1922; (3) how another mechanic put an adjusting device on a piston with a T-slot or left it off, depending upon the character of the cylinder; and (4) another instance of intervening rights years prior to the said amendment.

Schoengarth, patentee of No. 1,174,092, testified to the use of the expedient of T-wise splitting the skirt of a piston. He installed four pistons in a Ford truck in the spring of 1915 before writing to his patent attorneys on May 4, 1915. At that time he also made the drawing (Ex. 5-K-2) and the pistons were made and sold prior thereto. Before November, 1915, he replaced one of the original pistons sold with an oversize piston provided with a T-slot and without the adjusting device. Thereafter, he made pistons with a somewhat different adjusting mechanism, sold sets of pistons like Ex. 5-K-10 before March 26, 1917, which date is fixed by correspondence with his patent attorneys, the pistons operated until 1923.

Following Schoengarth's appearance as a witness an adjournment was had, and defendants' counsel stated that he would call Charles Garland, a mechanic who had worked with Schoengarth on the installation of his pistons in 1915, who was then too sick to appear to testify. Death overtook Garland before he testified, and Schoengarth testified that Garland had been interviewed by plaintiff's counsel during the recess. Any criticism of Schoengarth's testimony is hardly to be seriously considered since plaintiff's counsel have offered nothing to contradict his story, apparently given in good faith.

Schoengarth did not attempt to cover the T-slot expedient in his patent, so that feature became abandoned by him to the public. His testimony is clear that the T-slot expedient was in the set of pistons sold in the spring of 1915 and should constitute a bar to the claims of the Gulick patent directed to this feature. There is the further Schoengarth piston (Ex. 5-K-10) embodying arrangement of the T-slot with the head diameter extending down and overlapping the horizontal slot, which construction seems to constitute a reduction to practice and actual use of pistons. Further, as defendants urge, if the Schoengarth pistons are not sufficient to constitute a public use, his testimony and his patent application constitute intervening rights which should be an equitable estoppel as against this plaintiff.

Gulick and his counsel overlooked Schoengarth, or must have thought he would not show up for they diligently proceeded to antedate the Schoengarth patent by the affidavit under Rule 75 (Ex. 4-L, p. 1859), which, if not untruthful, at least misled the Patent Office. The presence of the adjusting mechanism in the Schoengarth pistons seems to be immaterial so far as this case is concerned for the T-slot, either with or without the adjusting mechanism, operates the same, that is, permits expansion and contraction of the skirt. If no one before had suggested a flexible piston it might be a different situation, but this had been suggested by Franquist in 1914, Rainforth in 1912 and Serex in 1911 and 1912, followed by Long, Spillman, Hives and even by Jardine and Maynard; and plaintiff accepted the ruling of the Patent Office that Ebbs did the same thing in 1902.

Plaintiff urges that there was only one witness produced to prove the use of the Schoengarth pistons. However, the fact that only one witness was produced does not alone justify a court in refusing to consider the subject of the testimony. In *Corona Cord Tire v. Dovan Corp.*, 276 U. S. 358 (1928), the Supreme Court accepted the uncorroborated testimony of a Dr. Kratz on the subject of a sale of 300 inner tubes, which was supported only by records of the order, and Mr. Chief Justice Taft said, p. 382:

> "It was not unnatural that with a small amount of D. P. G. he should try it in a special order of this kind from which he might confirm the conclusion he had already reached. The effort to disprove it was vague and inconclusive, which, it is only fair to say, was to be expected five years after the event."

The same can be said of Schoengarth for he had demonstrated the utility of the T-slot in the pistons of his patent, and it was, therefore, "not unnatural" that he should slit and install an overwise piston which did not require the adjusting means to keep it expanded. The testimony of one witness was also accepted as proof of the completion of an invention in *Armstrong v. De Forest Radio Telephone & Telegraph Co.*, 280 Fed. 584 (1922), where on p. 590 Judge Manton of the 2nd Circuit says:

> "There is no reason to doubt the testimony of the patentee as to the date of his inventive thought. While it is true that uncorroborated testimony of an inventor is to be accepted with caution (*Clark Thread Co. v. Willimantic Linen Co.*, 140 U. S. 481, 11 Sup. Ct. 846, 35 L. Ed. 521), yet there is no rule of law that requires the rejection of the uncorroborated testimony of an inventor as to the date of his conception. The court must be satisfied as to the fact of demonstration and that the conception was complete."

Long Pistons.

Defendants offered in evidence the Long pistons, and urge that these showed intervening rights, and examples of the expedients of the T-slot, but as against Jardine and Maynard, Long is offered for all purposes.

The Long pistons, patent Nos. 1,395,441, 1,489,499 and 1,572,772, are pleaded as a prior use (Def. Ex. 4-H), and exemplifications of the Long 6-slotted pistons are Defendants' Exs. E, F, G and R. Long submitted pistons to Franklin Manufacturing Company as early as March, 1916, as was also shown in interference proceedings, and on appeal in *Hertog v. Long*, 47 F. (2d) 369 (1931), the court says, at p. 370:

> "Louis M. Stellman, a witness whose testimony displays an intelligent grasp of the situation, and who was, at that time, chief engineer of the Franklin Manufacturing Company, testifies that in the early part of the year 1916 he talked with Long, and that Long displayed to him and others a piston of the type in question and which, according to his testimony, may be read plainly upon the second count of the interference."

As against the Gulick patent it is urged that the Long pistons constitute adverse rights to the expansion

of the Gulick application years after the Long pistons had gone into commercial use. These Long pistons illustrate the embodiment of the common T-slot expedient.

As against Jardine and Maynard it is urged that the Long pistons operate with full force and effect from the standpoint both of anticipation and lack of invention. It cannot be said that the Long pistons were impractical, for they were used in the air-cooled Franklin engine where pistons operate under the most adverse conditions.

The Long pistons, with the increase of engine speeds, went out of use in Franklin in 1926, plaintiff claims because the Long pistons scored at the junction of the webs with the skirt. This would have happened to Gulick, as well as to Jardine, neither of which patents was ever put into use, and the same thing happened to Maynard when it was attempted to use that patent structure. That the Long pistons went out of use seems to be immaterial.

Plaintiff urges that defendants' claim of intervening rights was disposed of by the case of *Roos v. McMillan*, 64 F. (2d) 568 (1933), "because Gulick disclosed and claimed broadly his piston from the beginning." Of course defendants' contention is that the Gulick claim was broadened in 1922 to cover something that he never had when filed, and if such view is adopted there is no pertinency in *Roos v. McMillan, supra*, as plaintiff contends.

INFRINGEMENT.

For the reasons previously given, the patents in suit are held invalid, which particularly applies to the claims alleged to be infringed by the Sterling and Ray Day pistons. The order of reference is general, and to comply therewith there must be consideration of the question of infringement. If any or all of the patents, or all or any of the claims alleged to be infringed should be held to be valid, they must be strictly construed as not to be infringed.

If the Gulick and Jardine patents differentiate from the prior art at all, it is by the employment of flexible webs extending from the wrist pin bosses to the skirt, which the Ray Day piston does not have, and the proof is here that the Sterling piston (Ex. 1) does not have such flexible webs as contemplated by the patents. The other Sterling pistons have no webs. The Gulick patent is thus restricted to a structure in which flexible webs extend from the wrist pin bosses to the skirt and are surrounded by the skirt, while the Jardine patent is re-

stricted to a slipper piston having flexible webs, and neither can comprehend a trunk piston with a dashed-in relief.

The Mooers patent is restricted to narrow connectors extending from the head flange to the bottom of the skirt, closely hugging the inside of the skirt so as to leave substantially 360 degrees separation. Sterling follows the Franquist patent and has from one-fourth to one-half isolation, that is through 90 to 180 degrees, with a connection between the head and the skirt in the region of the wrist pin bosses, made by heavy connectors as in Ex. 1, and extending for a quadrant. In Ray Day the connectors are from the head to the wrist pin bosses, requiring a sand core and are not from the head flange to the skirt permitting permanent molding.

The Schmiedeknecht patent is restricted to a construction in which each boss is supported at its end, with one end of the boss supported from the head, and the other end supported from the web. In the Sterling piston (Ex. 1) each boss is supported at its center, the opposite of what is described and claimed in the Schmiedeknecht patent.

The Maynard patent is not infringed unless the webs are flexible and so described in that patent, but that must be due to a construction contemplated by that patent, as plaintiff's expert said this was necessary as far as Gulick and Jardine patents are concerned. In the Sterling piston (Ex. 1) compensation is not secured at the top by web flexibility, but by the Keystone relief; and thus on plaintiff's claim Ex. 1 departs from the Maynard patent.

None of defendants' pistons have such identity or correspondence of structure, function and mode of operation as contemplated by the patents in suit, and particularly is this true as to those patents which are restricted by the prior art.

Heretofore has been considered the situation where a defendant has followed the prior art, citing decisions of this Circuit following the leading case of *McCormick v. Talcott*, 61 U. S. 402, where Judge Grier said, p. 405:

> "But if the invention claimed be itself but an improvement on a known machine by a mere change of form or combination of parts, the patentee cannot treat another as an infringer who has improved the original machine by use of a different form or combination performing the same functions. The inventor of the first improvement cannot invoke the doc-

trine of equivalents to suppress all other improvements which are not mere colorable invasions of the first."

To the same effect is *Electric Signal Co. v. Hall Signal Co.*, 144 U. S., 87 (1885), where Mr. Justice Matthews says, at p. 96:

"But this result or idea is not monopolized by the patent. The thing patented is the particular means devised by the inventor by which that result is attained, leaving it open to any other inventor to accomplish the same result by other means. To constitute identity of invention and therefore infringement, not only must the result attained be the same, but in case the means used for its attainment is a combination of known elements, the elements in both cases must be the same, and combined in the same way, so that each element shall perform the same function, provided, however, that the differences alleged are not merely colorable, according to the rule forbidding the use of known equivalents."

And again in *Westinghouse v. Boyden Brake Co.*, 170 U. S. 537 (1898), Mr. Justice Brown says, at p. 569:

"* * * the alleged infringer must have done something more than reach the same result. He must have reached it by substantially the same or similar means, or the rule that the function of a machine cannot be patented is of no practical value."

And after pointing out that "a charge of infringement is sometimes made out though the letter of the claims be avoided," he also says, p. 568:

"The converse is equally true. The patentee may bring the defendant within the letter of his claims, but if the latter has so far changed the principle of the device that the claims of the patent, literally construed, have ceased to represent his actual invention, he is as little subject to be adjudged an infringer as one who has violated the letter of a statute has to be convicted when he has done nothing in conflict with its spirit and intent."

The rule of *Railway v. Sayles Co.*, 97 U. S. 554 (1878), has been continuously followed in this Circuit, as follows, p. 556-7:

"But if the advance toward the thing desired is gradual, and proceeds step by step, so that no one

> can claim the complete whole, then each is entitled only to the specific form of device which he produces, and every other inventor is entitled to his own specific form, so long as it differs from those of his competitors, and does not include theirs."

The court, in *I. T. S. Rubber Co. v. Essex Co.*, 272 U. S. 427 (1926), decided that as to a claim which does not include on its face a limitation obviously intended, says, p. 442:

> "* * * we are of opinion that the claim should be construed and have the same effect as if it had been included. This is not in any real sense, a remaking of the claim, but is merely giving to it the meaning which was intended by the applicant and understood by the examiner."

And, at p. 444:

> "So where an applicant whose claim is rejected on reference to a prior patent, without objection or appeal, voluntarily restricts himself by an amendment of his claim to a specific structure, having thus narrowed his claim in order to obtain a patent, he 'may not by construction, or by resort to the doctrine of equivalents, give to the claim the larger scope which it might have had without the amendments which amount to a disclaimer.' *Weber Elec. Co. v. Freeman Elec. Co.*, 256 U. S. 668, 677."

In this Circuit the courts have had these questions before them on many occasions. In *Lektophone Corp. v. Crosley Radio Corp.*, 46 F. (2d) 126 (D. C. Ohio, 1928), Judge Hickenlooper, while District Judge, said, p. 130:

> "The defendant has done no more than to draw from the prior art, albeit including Hopkins, the various elements, themselves, all old, which accomplish to a material extent the desired results which it is claimed Hopkins accomplished, but by a combination of elements differing radically from the Hopkins combination in at least this one respect."
>
> "Hopkins nowhere taught the necessity of, or claimed as an element of his invention, means for restricting the edge of the cone against deformation. This was an incidental or accidental function of his annular rim, but there are many ways of accomplishing the same result. Hopkins chose one; the defendant another. So long as the defendant's

means of accomplishing the desired result is not merely the substitution of the mechanical equivalent for that of Hopkins, there can be no infringement."

In view of the fact that defendants' pistons approach the prior art as much if not closer than they do the pistons in suit, this case is quite in point, notwithstanding plaintiff's urge that the differences are only equivalent combinations. Such differences are shown by the means to secure compensation for expansion at the top of the skirt of the Sterling piston, and also in the Ray Day piston are different than the patents claim. Even in the Sterling piston (Ex. 1) which is said to have flexible webs but has none, the compensation at the top is secured by the Keystone relief which is unknown to Gulick, Jardine and even Maynard if the Maynard patent is a modified Jardine structure.

In *Fowler v. Detroit Bedding Co.*, 47 F. (2d) 752 (1931), in a *Per Curiam* decision, the court said, at p. 752:

"If the patent is valid (which we need not decide), the invention consists in so tapering and overlapping the ends of the bat that when it is folded about the core a bandage of uniform thickness results, or in the simplicity with which the bandage is manufactured, by merely tapering the ends of the bat before folding it."

Although the claim in that case was restricted to "tapered edges lapped on one side of the paper core," the contention was the defendant infringed because the claims could be read upon defendant's structure. The court, however, says, p. 752-3:

"Any slight tapering of the edges was not due to design, but was incidental to the manner in which the sheet or bat of the material came from the machine or to the effect of forcing it into the pleat of the cushion."

In *Directoplate Corp. v. Donaldson Lithographing Co.*, 51 F. (2d) 199 (1931), Judge Hickenlooper refers, as in other cases (p. 202) "to a specific construction of clearly defined elements all pertaining to the inventive step as he then understood it."

"Further than this, the defendant's device utilizes the forces of nature and operates in a manner substantially different from the device of the patent.

> The 'Bearing section' of the claim, as a separate unit unattached to negative or positioning frame, for so the claim must be construed in view of the specification, is wholly absent. So also are the practically unlimited play of the inner sealing strip upon the negative, the flange of the positioning section, and the function of the bearing section in horizontally bridging the gap between the negative and the positioning section. Elements of the claim are omitted, but more than this, the manner of operation of the two devices, we are convinced, is substantially different. If this be so the defendant's device does not infringe."

Again in *Goodyear Tire & Rubber Co. v. India Rubber Tire Co.*, 51 F. (2d) 204 (1931), in considering the status of the patent in view of the prior art, Judge Hickenlooper said, p. 206:

> "Here, the crowded condition of the patent art, the closely analogous uses by others (even if they be not regarded as anticipations), the nature of the disclosure, the very essence of the alleged inventive step, and the Patent Office proceedings, involving a possible estoppel, all limit the appellee to a breaker-strip of layers of parallel cords 'interposed between the tread and the cushion,' as provided in the claim and under principles more fully discussed in our opinion in *Directoplate Corp. v. Donaldson Lithographing Co.*, 51 F. (2d) 199, this day decided."

To the same effect is *Willett Mfg. Co. v. Root Spring Scraper Co.*, 55 F. (2d) 858 (C. C. A. 6, 1932); *Ottinger v. Ferro Stamping & Mfg. Co.*, 59 F. (2d) 640 (1932), decisions also by Judge Hickenlooper; and there is the very recent case of *Chicago Forging & Mfg. Co. v. Bode, Cummings Mfg. Co.*, 63 F. (2d) 928 (1933), where Judge Simons says, p. 930:

> "The defendant's device (see illustration), lacks the opposing inclined surface which we regard as necessary elements of the claim if it is to be considered as supported by the disclosure."
>
> "Obviously, and this was recognized by plaintiff's expert, the patentee was not entitled to claim all structures which exercised the desired function, but only those which he himself invented, and a device which produces the same result through translation of force operates in a substantially different manner than one in which force is directly applied."

Plaintiff urges that a different rule was followed by the Court of Appeals in *Byers Machine Co. v. Keystone Driller*, 44 Fed. 283 (C. A. 6, 1930), where the patents on a trench digging machine were held valid and infringed, but that case is clearly to be distinguished, for there the court said, p. 285, "that Clutter was a pioneer in this particular form or type of trench digging machine, and that claim 4 is entitled to a broad construction," which is quite different from the case presented at bar.

In *Remington Rand, Inc., v. General Fireproofing*, Equity No. 3441, before this court, it was said, p. 16:

> "These inventors entered an already crowded art, so that at the time the application was made for their patent, only improvements could be patented by them."

And further, at p. 22:

> "The rule is, that where the patent does not embody a primary invention but only an improvement to the prior art, and the defendant's machines can be differentiated, the charge of infringement is not sustained."

And again, in *Cleveland Tractor Co. v. International Harvester*, Equity No. 3860, it was held that claims must be construed not only in the light of the specification, but in light of the proceedings of the Patent Office, and it was said, at p. 23:

> "The rule of patent law is well established that the claims must be construed in the light of the specifications and drawings. Defendants cite *Computing Scale Co. of America v. Automatic Scale Co.*, 204 U. S. 609, in which there was read into a broad claim for 'mechanism' for doing a certain thing, the particular construction of such mechanism defined in the specification, in order to distinguish the invention from the prior art."

The listing of the Gulick patent as a pioneer patent, Jardine and Maynard as improvements which accomplish the useful purpose in a successful commercial form, and the Moores and Schmiedeknecht patents as patents which contribute to the utility and commercialization of that prior invention, is not justified on the record in this case. When it comes to infringement, the use of the Keystone relief in the Sterling piston (Ex. 1) compensates for expansion at the top where it is required, as distinguished

from making the webs flexible, and as to prior art, the mechanic had all the expedients at his command which he would naturally employ, and of this the Supreme Court says, in *Webster Loom Co. v. Higgins*, 105 U. S. 580 (1881), Mr. Justice Bradley saying, at p. 586:

> "He may begin at the point where his invention begins, and describe what he has made that is new, and what it replaces of the old. That which is common and well known is as if it were written out in the patent and delineated in the drawings."

RESORT TO "SYMPTOMS OF INVENTION" SO-CALLED, UNNECESSARY FOR SUCH NOT HERE CONTROLLING.

Plaintiff urges on behalf of the validity of these patents several arguments or claims which might be called "symptoms of invention." These are the long-felt want, prior efforts and failures, public adoption, public acquiescence and commercial success. The weight to be given such "symptoms of invention" in passing on patent validity is well settled. They are important and entitled to weight only when question of validity is doubtful.

Defendants answer that aluminum pistons were not needed until the recent developments of high speed automobile engines, and cite that even now one large manufacturer, General Motors Corporation, still uses iron piston; and there is also what Long showed in the making of aluminum pistons, with its beginnings in 1915-17.

COMMERCIAL ACCEPTANCE.

The situation here is peculiar, for the structures of none of the pistons in suit have ever gone into commercial use. That of Schmiedekneckt, Mocers, Gulick and Jardine not at all, while as to the Maynard design, the proof is that it was not used successfully until it had been provided with the Keystone relief. Particularly as to the Maynard piston it was discarded by Chrysler, an unwilling party plaintiff which has the right to its use as a half-owner of the patent.

Sales alone are not a test of patentability. In the early case of *McClain v. Ortmayer*, 141 U. S. 419 (1891), Mr. Justice Brown says, p. 428:

> "If the generality of sales were made the test of patentability, it would result that a person by securing a patent upon some trifling variation from

previously known methods might, by energy in pushing his goods drive competitors out of the market and secure a practical monopoly, without in fact having made the slightest contribution of value to the useful arts."

The plan of plaintiff and its licensees has been to control the market in the manufacture of aluminum pistons, and former competitors Bohn Aluminum & Brass and Kant-Skore became sub and collateral licensees. The statement is made that a settlement was made with Long, who had been a competitor, and although the terms do not appear in this case, such fact is admitted in plaintiff's reply brief, p. 160.

The language of Mr. Justice Stone in the recent Radio case of *De Forest v. General Electric*, 283 U. S. 664 (1931) is in point, where he says, p. 685:

"Only when invention is in doubt may advance made in the art be thrown in the scale to support it. If we were to assume that invention here was doubtful, we can find little to suggest that the high vacuum tube when produced satisfied a long felt want or that its present utility is indicative of anything more than the natural development of an art which has passed from infancy to its present maturity since Langmuir filed his application. There was little or no practical use for a high vacuum tube in 1913. The De Forest audion was not in general use and Langmuir did not see one until that year."

That was also a case where the application filed in 1913 issued some 12 years later in 1925, and it was held that no single element was broadly novel in the assemblage of elements making up the device defined in the issue.

The Court of Appeals of this Circuit had adopted the same view in *Jackson Shirt & Novelty Co. v. Rosenbaum*, 225 Fed. 331 (1915), and in *Weston Motor Carriage Co. v. Lindsay Auto Parts Co.*, 239 Fed. 821 (1917), where the specific design of the patent structure never was successful and did not become successful until redesigned with improvements added, and of this Judge Denison says, on the question of commercial success, p. 827:

"* * * but there is slight room to infer that its commercial acceptance was due to the merits of this particular patent rather than of the other patents and improvements which it embodied, and still

less to attribute its commercial success to the comparatively minor structural detail, viz. the peculiar sectional casing, without which it would not have responded at all to the two claims in suit. The commercial success of this Timken axle throws no light on the validity of this claim."

Also, the late Judge Westenhaver commented on the fact that "sales are due to the growth of industry and trade conditions and in no wise to the specific contribution," in *Troy Wagon Works v. Ohio Trailer*, 264 Fed. 347 (D. C. Ohio, 1920). In other Circuits there is *Haggerty v. Rawlings Mfg. Co.*, 14 F. (2d) 928 (C. C. A. 8, 1926), and in *Fleischman Yeast Co. v. Federal Yeast Co.*, 8 F. (2d) 186 (D. C. 1925), affirmed 13 F. (2d) 570 (C. C. A. 3, 1926), Judge Soper said, p. 199:

"Commercial success of a patented article is not persuasive evidence of invention as to a claim which covers only a part of the device or process, and, when it is shown that the claim in controversy does not cover the whole of the patented device or process, the weight of such evidence is very much reduced."

Such statement is pertinent here, for the patents formerly relied upon were the Spillman & Mooers and Franquist patents which expire in 1931 and 1932 respectively.

Acquiescence.

The various consent and default decrees on some of the patents in suit cannot help the plaintiff in this proceeding, nor is plaintiff helped by the fact that other suits are pending against Chrysler and Ray Day for the mere filing of a suit is only the assertion of the claim.

Until their expiration, plaintiff could rely upon the Spillman & Mooers and Franquist patents, and that piston manufacturers did not contest is no criterion of validity, for even the value and general use of a device will not sustain a patent if the lack of invention is clear. Of a situation not unlike that presented here, with the trustee owning many piston patents, Mr. Justice Holmes of the Supreme Court, in the recent *Mineral Separation v. Magma Copper*, 280 U. S. 400 (1930), says at p. 404:

"The petitioner adverts to the success that has attended the later patent and to the fact that the world waited until it appeared. But interlopers naturally would be slow to venture into the field occu-

pied by a powerful company armed with patent No. 835,120 and supported by a subtle ingenuity that we cannot doubt would have been exercised with even more effect to show that a process like that in No. 962,678 was an infringement than it now is to prove that the later patent was a revelation that transformed the art."

PRIOR ART NOT CITED IN THE ANSWER.

Over plaintiff's objection, there were offered in evidence several patents, publications and prior uses which were not cited in the answer. These included the patents to Howe, Leitzenmayer, Roots British, Serex French, Hartog and Pomeroy, articles by Ricardo in "The Automobile Engineer," by Gunn, Engineer of Packard, in "Automotive Industry," articles in "Automobile" of March 5th and March 12th, 1914, articles in "Horseless Age" of April 8, 1914 and December 24, 1913, the public and prior use by Monckmeier and Schoengarth, and sales by Schoengarth. As to Schoengarth, plaintiff later consented to an amendment to the answer.

Such patents, publications and prior uses constitute evidence of prior invention unless Gulick establishes an earlier date of invention, and the evidence offered seemed to be good references under R. S. 4920. The prior invention and not the patents which have been issued to such inventors constitute the defense as authorized in the second paragraph of the statute, and such defense is pleaded in the answer.

The rule is that notice need not be given prior to trial, of patents or other defenses to be introduced for the purpose of showing the prior art to demonstrate the lack of invention as distinguished from anticipation, *Grier v. Wall*, 120 U. S. 412 (1887); *Graham Paper Co. v. International Paper Co.*, 46 F. (2d) 881 (C. C. A. 8, 1931). The reason for such rule is pointed out by Judge Stone in *Zip Mfg. Co. v. Pasch*, 2 F. (2d) 828 (C. C. A. 8, 1924), where he says at p. 830:

> "The purpose of the statute is to prevent surprise in the evidence by giving the plaintiff thirty days notice of the particular patents and usage which will be relied upon in the challenge of the patent. Obviously, where the plaintiff must know of such instances, this notice serves no purpose. Such was the case of *Brown v. Piper*, cited above, where

prior usage was of such nature that the court took judicial notice thereof. It would seem to be an even clearer occasion for applying the same reasoning where the usage relied on is shown, in the language of the very patent in suit, to have been known to the plaintiff at that time. We think, therefore, that the trial court was right in considering, on the point of validity, the clear statement in this patent that grinding mixtures, employing oil as a 'binder,' were known to the art and that the improvement claimed was a change in the 'binder' from oil to starch."

The Pomeroy and Hartog patents in question are owned by the trustee plaintiff as shown in its *prima facie* case, and the Hartog patent was in Interference with Gulick. The Howe patent and the Hives British patent were cited by the Patent Office against the Maynard patent and the Schoengarth patent were also cited during the prosecution of the Gulick application and antidated Gulick. The Kant-Shore piston was known to plaintiff as it was manufactured by its licensee. None of these came as a surprise to plaintiff.

The particular pistons specified in the Bill of Complaint were the Sterling pistons Ex. 1 and the Ray Day piston Ex. 8. As the trial progressed, plaintiff's expert brought into the case five Sterling pistons and another Ray Day piston, asserting the five to be within the scope of Gulick, three within the scope of Jardine, three within the scope of Maynard and four within the scope of Moore. Following this came the offer of proof of the 1911 and 1914 Gulick pistons, and only late in the trial would plaintiff's counsel state its position as to whether the 1911 and 1914 pistons came within the scope of the Gulick patent. Having thus modified the issues, consideration of the Monckmeier piston seemed proper on the question of validity, and the same might be said to apply to the Serex French patents.

There is another view which justifies the consideration of the Monckmeier pistons and the Serex patent pistons on the question of validity, and that is from a standpoint of a well-known expedient of slotting the pistons through and through, and particularly by the T-slot. Such slotting was shown in the patents in Ebbs, Van Bever, Schoengarth, Vincent, Spillman, Long, Rainforth, Hives, Hartog, and now by Monckmeier and Serex, i.e. from Ebbs in 1902 to Hives in 1920. Thus the T-slot

was known over this period, and it seemed proper to receive evidence of additional instances of its notoriety without previous notice or in the answer; and this under the decisions of the court construing R. S. 4920, as was also done in *Cleveland Tractor v. International Harvester*, *supra*.

This practice is authorized by the rule as announced in *Elliott & Co. v. Youngstown Car Mfg. Co.*, 181 Fed. 345 (C. C. A. 3, 1910), by Judge Archbald, at p. 349:

> "The fact that so many persons caught the idea goes rather to prove that it was simple and obvious, and not that it required inventive genius to conceive. It is not like the case where the art is waiting for the device, and inventors striving unsuccessfully to produce it, under which circumstances invention may well be held to appear."

Cited with approval by Judge Killits of this District in *Phoenix Knitting Mill v. Rich*, 194 Fed. 721 (1911), *Freeney v. Bemis Bros. Bag Co.*, 1 F. (2d) 116 (C. C. A. 8, 1924); and Judge Westenhaver took the same view in *Open Hearth Furnace v. Youngstown Sheet & Tube Co.*, 2 F. (2d) 94 (1924), where there were a number of prior uses of the patent at different places.

The evidence of both the Monckmeier use and the Serax French patent can be here used to restrict the claims of all the patents in suit, particularly in view of plaintiff's insistence that the ordinary trunk piston provided with a relief and a T-slot, both known in the art, come within the scope of the patents in suit.

ALLEGED COPYING BY DEFENDANTS.

Plaintiff places much stress on the fact that the Sterling piston (Ex. 1) looks like that being sold by its licensees, although this can hardly be said of the other Sterling pistons and certainly not of the Ray Day pistons. As to this Sterling piston, the recent statement in *Buttendorf Co. v. Ohio Steel Foundry*, 56 F. (2d) 777 (C. C. A. 6, 1932), by Judge Hickenlooper, seems to be in point, at p. 779:

> "Clearly, if the claims as stated fail to disclose a patentable invention, no license is required, the device may be made and used by any one."

The mere copying of a device put on the market by plaintiff is not actionable unless a defendant palms off

its goods as those of plaintiff, and there is no evidence of that; also there is no allegation of unfair competition and plaintiff is not a manufacturer.

The defendants have not copied the structure of any of the patents in suit, not even that of Maynard, for a characteristic feature of Ex. 1 is the Keystone relief furnishing compensation at the top of the skirt, and compensation at the bottom being secured in the way long known to the art by splitting the piston skirt from the bottom up. Should plaintiff answer that the defendants are estopped to deny the utility of the Maynard piston without the Keystone relief and in spite of modification of Maynard as used, on this question of utility there is the statement in *Sandy MacGregor Co. v. Vaca Grip Co.*, 2 F. (2d) 655 (1924), where Judge Denison says, at p. 656:

> "Sufficient practical utility to make a device 'useful,' in the sense of the patent statute, is, we suppose, what is meant by the cases which say that an infringing defendant is estopped to deny utility. The phrase 'patentable utility' is sometimes perhaps rather inaccurately used to denote the function of being useful plus the skill of the inventor as distinguished from that of the mechanic. Of course, the infringer is not estopped to deny patentable utility in this sense, because if he were he could never dispute patentability."

And this view of the Court of Appeals was followed in *Seymour v. Ford Motor*, 44 F. (2d) 306 (C. C. A. 6, 1930).

Consideration has been given to all the issues, and there has been omitted from this report any discussion as to the efforts of plaintiff or The Aluminum Company of America to establish and control a monopoly in the manufacture of aluminum pistons. Defendants earnestly urge this to be a vicious monopoly, but that question is not here for discussion, and even if it were here, a disposition of such question has been made unnecessary by the findings of invalidity and non-infringement.

The Master reports that on the 30th day of December, 1933, he handed draft copies of this report to counsel and asked that errors and correction to be made be pointed out by counsel by January 15, 1934, that the Master might consider and make such corrections insofar as the Master believes proper and in keeping with the views as expressed in this report. Such suggestions have

been received and corrections made in the report. Two copies of this report have been furnished to counsel for each party.

Herewith I hand up for your Honors the following:

(1) Original files and papers from the Clerk of the Court in the three cases.

(2) Stipulations.

(3) Transcript of testimony, together with 134 Plaintiff's Exhibits and 91 Defendants' Exhibits.

(4) Briefs of counsel.

(5) Suggested findings of fact and conclusions of law submitted by counsel.

(6) Report of Special Master.

Respectfully submitted,

Wm. B. Woods,
Special Master.

PLAINTIFFS' EXCEPTIONS TO THE REPORT OF THE SPECIAL MASTER.

(Filed February 26, 1934.)

[Case No. 4045.]

Now come the plaintiffs and file this, their objections and exceptions to the findings, conclusions and report of the Hon. William B. Woods, Special Master, filed January 27, 1934, as follows*:

EXCEPTION NO. 1.

Plaintiffs object and except to the Master's Finding of Fact No. F1 (M. R. p. 1098) and to each of the following statements and conclusions thereof:

(a) "That the pistons of the Gulick patent embodies the fundamental structure of the Franquist patent No. 1,153,902"

as contrary to the evidence; see the testimony of Defendants' witnesses Stellman R. pp. 536, 553, 554 and 567, Dorris R. pp. 1078 and 1079, Jeffries, made defendants' witness on cross examination exceeding direct, over plaintiffs' objection, R. pp. 175 to 178, and plaintiffs' witness Jeffries R. pp. 201 to 203, 248, 942, 943 to 945 and 952; and see defendants' Exhibit 3-Q, piston made in accordance with the Franquist patent R. p. 178, and defendants' Exhibit 4-L, Gulick file wrapper, p. 1938 (citing Franquist patent); and as contrary to the evidence cited in support of Exception 3 hereof; and except and object to the statement:

(b) "and that the piston of the Franquist patent is operative to substantially compensate for expansion"

as contrary to the evidence; see evidence cited under "a", *supra*; and except and object to the statement and conclusion:

---

*The following authorities have been relied upon for the form and manner of the exceptions taken herein:

Harding v. Handy et al., 11 Wheaton, 103, 6 L. Ed. 429;
Sheffield v. Gordon, 151 U. S. 285, 38 L. Ed. 164;
Sandford v. Embry, 151 Fed. 977, 982 (C. C. A. 8th);
Columbus etc. Ry. Appeals, 109 Fed. 180, 219 (C. C. A. 6th);
Savage v. Monarch, 64 Fed. 2d. 650, 651 (C. C. A. 10th);
Thomsen v. Stenabery, 55 Fed. 2d. 715, 716 (D. C. Ill.);
Perdyce v. Omaha, 145 Fed. 544, 557 (C. C. Mo.).

(c) "that the piston of the Gulick patent employs essentially the webs of the Spillman & Mooers patent No. 1,262,870 and of the Chenard & Walcker Patent No. 493,595"

as contrary to the evidence; see testimony of defendants' witness Stellman R. pp. 496 and 562, Jeffries, made defendants' witness on cross examination preceding the direct over plaintiffs' objections R. pp. 161 to 167, plaintiffs' witness Jeffries R. pp. 135 to 137, 943 to 949, and see plaintiffs' Exhibits 84; 67c p. 1539 and defendants' Exhibit 4L, Gulick file wrapper, pp. 1943, 1949, 1936 and 1938, (citing Spillman and Mooers and Chenard and Walcker); and as contrary to the evidence cited in support of item (a), *supra*, and plaintiffs' Exception No. 3 *post*; and except and object to the statement and conclusion:

(d) "that the web construction of the Gulick patent differentiates from those of Spillman & Mooers and Chenard & Walcker simply in matter of design involving mechanical skill"

as contrary to the evidence; see testimony of defendants' witness Stellman, Deposition R. p. 458, R. pp. 554, 555, 556 and 566, and contrary to the evidence cited in support of items (a) and (c) *supra*, and plaintiffs' Exception No. 3 *post*; and except and object to the statement and conclusion:

(e) "that splitting of the skirts of the Franquist, Spillman & Mooers and Chenard & Walcker patents by through slotting was within the purview of one skilled in the art."

as contrary to the evidence; see testimony of defendants' witnesses Stellman R. pp. 460 and 461, 538 to 541, 544, 545 to 547, 548, 554, 555, 562, 565, 567, 570 to 573, Dorris R. p. 1077, and also contrary to the evidence cited under items (a), (b), (c), and (d) *supra* and in Exception No. 3, *post*.

EXCEPTION NO. 2.

Plaintiffs further object and except to the failure of the Master to adopt items 1 and 2 of page 22 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

That the piston described and claimed in Gulick patent, No. 1,815,733, in suit was based upon a

new and original combination of elements that, coacting together, gave rise to a new mode of operation of the resulting piston structure, and the new combination of elements described in the Gulick patent and claimed in the claims in suit of the patent provided the first piston structure embodying these elements in combination and having the same mode of operation and accomplishing the results of the Gulick patented piston, and no prior art piston exhibited to the Court has the structure, mode of operation or accomplishes the results of the piston described and claimed in the Gulick patent in suit.

as shown by the evidence; see testimony of defendants' witness Stellman, R. pp. 554 and 566, and of plaintiffs' witness Jeffries R. pp. 188, 189, 195 to 202, 203, 204, 259 and 260, and as shown by the evidence cited in support of Exception No. 1, *supra*.

EXCEPTION NO. 3.

Plaintiffs further object and except to the failure of the Master to adopt items 1, 2, 3 and 4, pages 10 and 11, of plaintiffs' proposed Findings of Fact, briefly summarized as follows:

(a) That long prior to November 1920 the beneficial properties of aluminum and aluminum alloys as a material for pistons and piston structures was well understood in the art;

as shown by the evidence; see testimony of defendants' witness Stellman, Deposition pp. 458, 459, 460, 463, Dorris R. p. 1078, and plaintiffs' witness Dr. Jeffries R. pp. 90, 91, 98 to 109; and

(b) that there existed a long felt want for such inventions which was long unsupplied;

see testimony of defendants' witnesses Stellman, Deposition R. pp. 458, 460, 480, 538 to 541, 545 to 548, Venner, R. p. 347, and plaintiffs' witness Jeffries R. pp. 67, 92, 145, 185 to 187; and

(c) that there were many prior efforts and failures to accomplish what the patentees accomplished by men of outstanding ability and experience and skill in the art;

see testimony of defendants' witnesses Stellman, Deposition R. pp. 460, 461, 463, 464, 466, 467 and R. pp. 545 to 548 and 587 to 590, Dorris R. pp. 1074, 1075, 1078, 1079 and 1080, plaintiffs' witnesses Jeffries, R. pp. 185, 205 to 206 and 936, Murphy R. pp. 657 and 662, and Burns R. p. 675; and

(d) that the problem of providing a satisfactory piston in either iron or aluminum was a very complex problem;

see testimony of defendants' witnesses Stellman, Deposition R. pp. 459, 460, 463, 469 and R. pp. 588 to 590, Dorris R. pp. 1066 to 1076, 1077, 1078 and 1081, and plaintiffs' witness Jeffries R. p. 64; and

(e) that when the inventions of the patents in suit were made known to the public they were generally and extensively adopted by the public, who, generally speaking, have acquiesced in the patents in suit;

see testimony of defendants' witness Stellman, Deposition R. pp. 461 and 462, 470 and 471, Dorris R. pp. 1073 and 1074, plaintiffs' witness Jeffries R. pp. 78, 126, 132, 135, 136, 955, 1050 and 1051, and see the license agreements plaintiffs' Exhibits 38, 39 and 40, and the piston royalty reports plaintiffs' Exhibit 13; and

(f) that automobile engines were redesigned to take advantage of aluminum pistons;

see testimony of defendants' witness Stellman, Deposition R. p. 466; and

(g) that there has been persistent infringement in the face of litigation and Sterling Products Corporation duplicated pistons made by plaintiffs' licensees and made a substantial duplicate of pistons shown in the Maynard patent, after having made efforts to produce a satisfactory piston along other lines,

see plaintiffs' Exhibits 10A, 11, 12 and 19, and testimony of defendants' witnesses Stellman, Deposition R. pp. 461, 462, 470 and 471 and Dorris R. pp. 1073 to 1074 and 2168; and

(h) that the form of piston shown in the Maynard patent with slight and immaterial changes has been the standard form of piston ever since 1920.

See testimony of defendants' witness Stellman, Deposition R. pp. 461, 462 and 470, and plaintiffs' witness Jeffries R. pp. 80 to 86, 126, 132, 135, 136, 955, 1050 and 1051.

EXCEPTION NO. 4.

Plaintiffs object and except to the following statements and conclusions in the Master's Finding of Fact No. 12 (M. R. p. 1088)

> "That by admissions of plaintiffs' witness Gulick, Gulick abandoned and had in public use in this country during the year 1911, a piston exemplified by Exhibit 48, and during the year 1914, a piston exemplified by Exhibit 51;"

as contrary to the evidence; see testimony of plaintiffs' witness Gulick, R. pp. 731, 740, 741, 745 to 748, 754, 755, 756, 757, 758, 759, 761 and 805, and see defendants' Exhibit 4-L pp. 1842, 1859 to 1863, and 1952 to 1963 inclusive, and Interference decisions, plaintiffs' Exhibits 67C p. 1539, 69A p. 1550, 70A pp. 1566 and 1569, and 70B p. 1571.

EXCEPTION NO. 5.

Plaintiffs object and except to each statement and conclusion of the Master's Finding of Fact No. 14 (M. R. p. 1098)

> "That the Gulick specification while pending in the Patent Office was broadened beyond the original disclosure while pistons were produced, used and sold by the following parties:
>
> Elmer C. Long
> Gustave C. Monckmeier
> Walter L. Schoengarth
> Albert L. Spillman
> Kant-Skore Mfg. Co.
> Stephen B. Hartog
> Frank Jardine
> Aluminum Co. of America
> Howard E. Maynard
> Maxwell Motor Co.
> Ray Day
> William E. Vapner"

as contrary to the evidence; see testimony of defendants' witness Stellman R. pp. 567, 577, 578 and 579, Jeffries

made defendants' witness on cross examination exceeding the direct, over plaintiffs' objection, R. pp. 150, 155 and 156, and plaintiffs' witness Jeffries R. p. 201; and see defendants' Exhibit 4-L, Gulick file wrapper; and as contrary to the concurring findings of the Law Examiner (plaintiffs' Exhibits 68A and 69A), the Examiner of Interferences (plaintiffs' Exhibits 67B and 69A'), the Examiners-In-Chief (plaintiffs' Exhibit 68B), the Commissioner of Patents (defendants' Exhibit 4-F), the Board of Appeals (plaintiffs' Exhibits 67C, 69B and 69B"), the Court of Appeals of the District of Columbia 17 Fed. (2d) 686 (plaintiffs' Exhibit 68C), and the Court of Customs and Patent Appeals, 47 Fed. (2d) 365 (plaintiffs' Exhibit 67D) and 47 Fed. (2d) 367 (plaintiffs' Exhibit 69C).

EXCEPTION NO. 6.

Plaintiffs further object and except to the Master's Finding of Fact No. 14 (M. R. p. 1098), quoted in Exception No. 5, *supra*, and particularly to that portion thereof which states that certain pistons were produced, used and sold by various parties therein enumerated while the Gulick application was pending in the Patent Office (erroneously said by the Master to have been broadened beyond the original disclosure) as being irrelevant and immaterial.

EXCEPTION NO. 7.

Plaintiffs further object and except to the failure of the Master to adopt Item 10, pp. 12 and 13 of Plaintiffs' proposed Findings of Fact, briefly summarized as follows:

> That claim 1 of the Gulick patent in suit was in Gulick's application when it was originally filed, as original claim 3 (defendants' Exhibit 4-L, p. 1839) and remained in the Gulick application unchanged throughout the prosecution of the application in the Patent Office.

EXCEPTION NO. 8.

Plaintiffs further object and except to the failure of the Master to adopt Item 23, p. 21 of the plaintiffs' proposed Findings of Fact, as follows:

> Gustave Monckmeier, Walter L. Schoengarth, Albert L. Spillman, Stephen D. Hartog, Frank

Jardine, Howard E. Maynard and Ray Day individually produced, used and sold no pistons while the Gulick application was pending in the Patent Office. The Kant-Skore Manufacturing Company and Aluminum Company of America produced, used and sold their pistons under license from the Plaintiff The Cleveland Trust Company, which license included the Gulick application, plaintiffs' Exhibits 38 and 39. William E. Venner produced, used and sold not more than three or four sets of pistons, the castings for which were made by Aluminum Company of America (Venner deposition p. 352). The pistons produced, used and sold by Venner or Long after the Gulick application was filed, and the Ray Day piston shown in plaintiffs' Exhibits 35 and 8, and the Jardine (Aluminum Company of America) and Maynard (Maxwell Motor Company) pistons all came within Claim 1 of the Gulick patent (Claim 3 of the Gulick application as filed) which claim has been in the application ever since it was filed and these pistons likewise came within the subject-matter which was otherwise claimed all during the prosecution of the Gulick application (See claim 1 of Gulick patent and defendants' Exhibits E, F, R and G, and plaintiffs' Exhibits 1 and 8, and Jardine and Maynard patents). Maxwell Motor Company produced, used and sold pistons licensed through Aluminum Company of America, under the patents in suit during the prosecution of the application of the patent in suit. (R. pp. 78, 126, 132, 135, 136, 955, 1050 and 1051.)

EXCEPTION NO. 9.

Plaintiffs except and object to the Master's Finding of Fact No. 15 (M. R. p. 1098) and to each and every statement and conclusion thereof, as follows:

> "That after the filing of the Gulick application, his application was materially modified, both as to the specification and claims without warrant therefor in the original disclosure"

as contrary to the evidence; see complete file wrapper and contents of Gulick application, defendants' Exhibit 4-L, and see testimony of plaintiffs' witness Jeffries, R. pp. 173, 174 and 201, and the evidence cited in support of Exception No. 5, *supra*.

EXCEPTION NO. 10.

Plaintiffs object and except to the failure of the Master to adopt item 19, page 20 of plaintiffs' proposed Findings of Fact:

> That there was no enlargment of the disclosure of the Gulick specification or claims over the original disclosure

as shown by the evidence cited in support of plaintiffs' Exceptions Nos. 5, 7, 9 and 11:

EXCEPTION NO. 11.

Plaintiffs object and except to each statement and conclusion of the Master's Finding of Fact No. 16 (M. R. p. 1099)

> "That the Gulick patent does not describe in sufficient detail to enable one skilled in the art to reproduce the same, the length and thickness of the webs required to secure flexibility"

as contrary to the evidence; see testimony of defendants' witness Stellman R. pp. 567, 578 and 579, and plaintiffs' witness Jeffries, R. pp. 173, 174 and 201, and see the concurring findings of the Courts and Patent Office tribunals, plaintiffs' Exhibits 67, 68 and 69 (17 F. (2d) 686, 47 F. (2d) 365 and 47 F. (2d) 367), and as contrary to and irreconcilable with the Master's Findings of Fact Nos. 19 and 24 (M. R. p. 1099).

EXCEPTION NO. 12.

Plaintiffs further object and except to the failure of the Master to adopt item 22 of page 14 of plaintiffs' proposed Findings of Fact in substance briefly as follows:

> That the Gulick patent in suit is not indefinite and that the disclosure of the Gulick patent in suit is sufficient to teach those skilled in the art how to practice the inventions described and claimed therein

as shown by the evidence cited in support of plaintiffs' Exception No. 11, *supra*.

EXCEPTION NO. 13.

Plaintiffs object and except to the Master's Finding of Fact No. 17 (M. R. p. 1099) and to each and every part thereof, comprising each of the following statements and conclusions:

(a) "That the Jardine patent embodies the fundamental structure of Franquist patent No. 1,153,902,"

as contrary to the evidence; see the testimony of defendants' witnesses Stellman, R. pp. 554 and 566, Dorris R. p. 1079, and Jeffries, made defendants' witness on cross examination exceeding the direct over plaintiffs' objection, R. pp. 177 and 178, and plaintiffs' witness Jeffries R. pp. 202 to 204 and 207; and see defendants' Exhibit 3-Q, piston made in accordance with the Franquist patent R. p. 178, and the tests thereof exhibited to the Master R. pp. 207 and 208; and object and except to the statement and conclusion:

(b) "that it employs essentially the slipper piston structure of the Ricardo patent No. 1,294,833; and"

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 529, 554 and 566, and Plaintiffs' witness Jeffries R. pp. 74 to 76, 188, 189, 196, 259 and 260, and see defendants' Exhibit 4-L, p. 2052 (Jardine file wrapper citing Ricardo patent); and object and except to the statement and conclusion:

(c) "that the splitting of the slippers of the Ricardo patent was within the purview of one skilled in the art;"

as contrary to the evidence; see testimony of defendants' witnesses Stellman R. pp. 538 to 541, 545 to 547, 547, 554 and 566, Dorris R. pp. 1081 and 1082, and plaintiffs' witness Jeffries R. pp. 117, 142, 144, 145, 184 to 188, 205, 206, 219, 220, 226, 228, 256 to 257, 260 and 261, and the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 14.

Plaintiffs except and object to each and every statement and conclusion of the Master's Finding of Fact No. 18 (M. R. p. 1090)

"That the Jardine patent piston differs from the piston of the Long patent 1,872,772 in matters involving mere mechanical skill."

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 529, 562, 554 and 566; and contrary to the findings of the Patent Office in allowing

the claims of the Jardine patent after extensive interferences with various Long applications, including his application that matured into Patent 1,572,772 (defendants' Exhibit 4L, pp. 2068 to 2100) and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*, and plaintiffs' Exception No. 42, *post*.

EXCEPTION NO. 15.

Plaintiffs except and object to each and every statement and conclusion of the Master's Finding of Fact No. 19 (M. R. p. 1099)

> "That the Jardine piston differs from the piston of the Gulick patent in matters involving mere mechanical skill."

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 554 and 566, and plaintiffs' witness Dr. Jeffries R. pp. 74 to 76, and the findings of the Patent Office in allowing the claims of the Jardine patent after numerous and extensive interferences with the Gulick application (defendants' Exhibit 4L, pp. 2068 to 2087) and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 16.

Plaintiffs further object and except to the failure of the Master to adopt items 1 and 2 of page 24 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

> The piston described and claimed in Jardine Patent No. 1,763,523 was based upon a new and original combination of elements that, coacting together, gave rise to a new mode of operation of the resulting piston structure and the new combination of elements described in the Jardine patent in suit and claimed in the claims in suit of the patent provided the first piston structure embodying these elements in combination and having the mode of operation and accomplished the results of the Jardine patented piston, and no prior art structure exhibited by defendants has the structure, mode of operation, or accomplishes the results of the piston described and claimed in the Jardine patent in suit.

as shown by the evidence; see testimony of defendants' witness Stellman R. p. 554, and the evidence cited in support of Exceptions Nos. 13, 14 and 15, *supra*.

EXCEPTION NO. 17.

Plaintiffs except and object to each and every statement and conclusion of the Master's Finding of Fact No. 20 (M. R. p. 1099)

> "That the Jardine patent does not describe in sufficient detail to enable one skilled in the art to reproduce the same, the length and thickness of the webs required to secure flexibility."

as contrary to the evidence; see the testimony of defendants' witness Stellman, Deposition R. pp. 461, 462 and 470, and R. p. 539, and plaintiffs' witness Jeffries R. pp. 122, 170, and see the Jardine patent in suit (plaintiffs' Exhibit 3); and as contrary to and irreconcilable with the Master's Finding of Fact No. 22 (M. R. p. 1099).

EXCEPTION NO. 18.

Plaintiffs further except to the failure of the Master to adopt item 22, page 14 of plaintiffs' proposed Findings of Fact, in substance briefly as follows:

> That the Jardine patent in suit is not indefinite and that the disclosure of the Jardine patent in suit is sufficient to teach those skilled in the art how to practice the invention described and claimed therein.

as shown by the evidence cited in support of plaintiffs' Exception No. 17.

EXCEPTION NO. 19.

Plaintiffs except and object to the Master's Finding of Fact No. 21 (M. R. p. 1099) and to each and every part of each of the following statements made therein:

> "The Maynard patent embodies the fundamental structure of the Franquist patent No. 1,153,902, and that the splitting of the skirt by through and through slotting was within the purview of one skilled in the art."

as not pleaded against this patent in defendants' answer; and as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 528, 554 and 566; and

plaintiffs' witness Jeffries R. p. 204, and the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 20.

Plaintiffs except and object to each and every statement of the Master's Finding of Fact No. 22

> "That the Maynard patent piston differs from the piston of the Jardine patent 1,763,523 in matters involving mere mechanical skill."

as contrary to the evidence; see testimony of defendants' witness Stellman, R. pp. 554 and 566, and plaintiffs' witness Jeffries, R. pp. 76 and 77; and see defendants' Exhibit 4L (file wrapper of Maynard showing extensive interferences with Jardine) and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 21.

Plaintiffs except and object to each and every statement and conclusion of the Master's Finding of Fact No. 23

> "That the Maynard patent piston differs from the piston of the Long patent 1,395,441 in matters involving mere mechanical skill."

as contrary to the evidence; see testimony of defendants' witness Stellman R. pp. 554 and 566, and the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 22.

Plaintiffs except and object to each and every statement of the Master's Finding of Fact No. 24 (M. R. p. 1099)

> "That the Maynard patent piston differs from the piston of the Gulick patent in matters involving mere mechanical skill."

as contrary to the evidence; see testimony of defendants' witness Stellman, R. pp. 554 and 566, and plaintiffs' witness Jeffries R. pp. 81 and 82, and see defendants' Exhibit 4L, pp. 1871 to 1893, (Maynard file wrapper showing extensive interferences with Gulick); and contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 23.

Plaintiffs except and object to each and every statement of the Master's Finding of Fact No. 25 (M. R. p. 1099)

> "That the Maynard patent piston differs from the piston of the Schmiedeknecht patent in matters involving mere mechanical skill."

as contrary to the evidence; see testimony of defendants' witness Stellman R. pp. 554 and 566 and see defendants' Exhibit 4L$_{11}$, p. 2219 (Maynard file wrapper showing consideration of Schmiedeknecht patent); and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 24.

Plaintiffs except and object to each and every statement of the Master's Finding of Fact No. 26 (M. R. p. 1099)

> "That the Maynard patent piston differs from the piston of the Ricardo patent 1,294,883 in matters involving mere mechanical skill."

as contrary to the evidence; see testimony of defendants' witness Stellman R. pp. 554, 555, 566 and 574, and plaintiffs' witness Jeffries R. p. 188, and see defendants' Exhibit 4L$_{4}$, p. 2155 (Maynard file wrapper showing consideration of Ricardo patent); and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 25.

Plaintiffs except and object to each and every statement of the Master's Finding of Fact No. 27 (M. R. p. 1099)

> "That the Maynard patent piston differs from the piston of the Hives patent No. 140,996 in matters involving mere mechanical skill."

as not pleaded in defendants' answer, and as contrary to the evidence; see the testimony of defendants' witness Stellman, R. p. 554, plaintiffs' witness Jeffries, R. p. 940, and see defendants' Exhibit 4L$_{11}$, page 2168, (Maynard file wrapper showing consideration of Hives patent); and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 26.

Plaintiffs further except and object to the failure of the Master to adopt items 1 and 2, page 25 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

> The piston described and claimed in Maynard patent, No. 1,053,962, in suit was based upon a new and original combination of elements that, coacting together, gave rise to a new mode of operation of the resulting piston structure and the new combination of elements described in the Maynard patent and claimed in the claims in suit of the patent provided the first piston structure embodying these elements in combinations, and having the mode of operation and accomplishing the results of the Maynard patented piston, and no prior art piston exhibited to the Court has the structure, mode of operation, or accomplished the results of the piston described and claimed in the Maynard patent in suit.

as shown by the evidence; see evidence relied upon in support of plaintiffs' Exceptions Nos. 19, 20, 21, 22, 23, 24 and 25.

EXCEPTION NO. 27.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 28 (M. R. p. 1060)

> "That the Moqers patent embodies the fundamental structure of the Franquist patent No. 1,153,902 and that the employment of narrow connectors was within the purview of one skilled in the art."

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 554 and 574, and Jeffries, made defendants' witness by cross examination exceeding direct over plaintiffs' objection, R. pp. 168 and 175 to 178, and plaintiffs' witness Jeffries, R. pp. 202, 204 and 205; and see defendants' Exhibit 4L, p. 1988 (file history of Moqers showing consideration of Franquist patent) and as contrary to the evidence cited in support of Exception No. 3, *supra*.

EXCEPTION NO. 28.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 29 (M. R. p. 1100)

> "That the Moocrs patent piston differs from the piston of the Spillman & Moocrs patent No. 1,092,870 in suit in matters involving mere mechanical skill."

as contrary to the evidence; see the testimony of defendants' witness Stellman, R. pp. 554, 560 and 561, and Jeffries, made defendants' witness on cross examination exceeding direct over plaintiffs' objection, R. pp. 108 to 109, and plaintiffs' witness Jeffries R. pp. 197, 198 and 204; and see face of Moocrs patent citing Spillman & Moocrs; and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 29.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 30 (M. R. p. 1100)

> "That the Moocrs patent piston differs from the piston of the Chenard & Walcker patent No. 468,595 in matters involving mere mechanical skill."

as contrary to the evidence; see testimony of defendants' witness Stellman, R. pp. 554, 560, 561 and 562, and plaintiffs' witness Jeffries R. pp. 947 and 948; and see defendants' Exhibit 4L,, page 1988, (Moocrs file wrapper showing consideration of Chenard & Walcker patent); and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 30.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 31 (M. R. p. 1100)

> "That the Moocrs patent piston differs from the piston of the Gulick 1911 and 1914 pistons (Exhibits 48 and 51) in matters involving mere mechanical skill."

as contrary to the evidence; see the testimony of defendants' witness Stellman, R. p. 554; and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 31.

Plaintiffs further object and except to the failure of the Master to adopt items 1 and 2 of page 27 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

> That the piston described and claimed in Mooers patent No. 1,402,309 was based upon a new and original combination of elements that, coacting together, gave rise to a new mode of operation of the resulting piston structure and the new combination of elements described in the Mooers patent in suit and claimed in the claims in suit of his patent provided the first piston structure embodying these elements in combination having the mode of operation and accomplishing the results of the Mooers patented piston, and no prior art structure exhibited by defendants had the structure, mode of operation or accomplished the results of the piston described and claimed in the Mooers patent in suit.

as shown by the evidence cited in support of plaintiffs' Exceptions Nos. 27, 28, 29 and 30, *supra*.

EXCEPTION NO. 32.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 32 (M. R. p. 1100)

> "That after the filing of the Mooers application, his application was materially modified both as to specification and claims without warrant therefore in the original disclosure."

as contrary to the evidence; see testimony of defendants' witness Stellman R. p. 517, and plaintiffs' witness Jeffries R. pp. 78 to 79.

EXCEPTION NO. 33.

Plaintiffs further object and except to the failure of the Master to find:

> That there was no enlargement of the disclosure of the Mooers specification or claims over the original disclosure.

as shown by defendants' Exhibit $4L_1$ (file wrapper of the Mooers patent), offered R. p. 591, and the affidavits appearing therein on pages 16, 37 and 38.

EXCEPTION NO. 34.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 33 (M. R. p. 1100) comprising the statement and conclusion

(a) "That the Schmiedeknecht patent involves the fundamental structure of the Franquist patent No. 1,153,909 or of any trunk piston;"

as not pleaded against this patent in defendants' answer; as contrary to the evidence; see the testimony of defendants' witness Stellman, R. pp. 554, 552, 553 and 522; and plaintiffs' witness Jeffries, R. pp. 114 and 205; and as irreconcilable and inconsistent with the Master's holding (M. R. p. 1119); and excepts to the statement and conclusion:

(b) "that it employs essentially the construction and arrangement of webs and mounting of wrist pin bosses of the Pugh British patent 17,256 of 1907 and the arrangement of the webs of the Ferry British patent 12,772 of 1914; and that the construction of the Schmiedeknecht patent differs from those of Pugh and Ferry patents and from a trunk piston in matters of design involving mere mechanical skill."

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 513, 515, and 516, and plaintiffs' witness Jeffries R. pp. 114 to 115, 950 and 951, and see defendants' Exhibit 4L., (the Schmiedeknecht file wrapper showing consideration of the Pugh and Ferry patents); and as contrary to the evidence cited in support of plaintiffs' Exception No. 3, *supra*.

EXCEPTION NO. 35.

Plaintiffs further object and except to the failure of the Master to adopt items 1 and 2 of page 26 of plaintiffs' proposed Findings of Fact;

That the piston described and claimed in Schmiedeknecht patent No. 1,256,265 was based upon a new and original combination of elements that, coacting together, gave rise to a new mode of operation of the resulting piston structure, and the new combination of elements described in the Schmiedeknecht patent in suit and claimed in the claims in suit of the Schmiedeknecht pat-

ent provided the first piston structure embodying those elements in combination and having the mode of operation and accomplishing the results of the Schmiedeknecht patented piston, and no prior art piston structure exhibited by defendants has the structure, mode of operation or accomplished the results of the piston described and claimed in the Schmiedeknecht patent in suit.

as shown by the evidence cited in support of plaintiffs' Exception No. 34, *supra*.

EXCEPTION NO. 36

Plaintiffs object and except to the Master's Finding of Fact No. 34 (M. R. p. 1100) in the Master's use of the word "admission" in line 1 thereof as erroneously characterizing the whole direct Gulick testimony, R. pp. 699 to 730; and object and except to the statement and conclusion:

(a) "that such piston like Ex. 51 was not given a block test for the reason given by Gulick that he was satisfied with the previous tests * * *;"

as contrary to evidence of plaintiffs' witness Gulick R. p. 734; and object and except to the statement and conclusion:

(b) "that no effort was made to place the embodiments of the 1911 and 1914 pistons in the application of the Gulick patent;"

as contrary to the evidence cited in support of plaintiffs' Exception No. 7, *supra*, and as contrary to and irreconcilable with that part of the Master's Finding of Fact No. 12 (M. R. p. 1098) stating:

(c) "that by admission of plaintiffs' counsel, both pistons (the 1911 and 1914 pistons) embody the subject matter of claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 42 and 43 and Ex. 51 (the 1914 piston) additionally of claim 38." (Parenthetical inserts ours)

EXCEPTION NO. 37.

Plaintiffs object and except to the failure of the Master to find from the evidence:

(a) That the piston is the heart and vital spot of the motor and it is essential that pistons be rugged and durable;

see testimony of defendants' witnesses Stellman, R. pp. 588 to 590, Dorris R. p. 1077, plaintiffs' witness Jeffries R. pp. 61, 62, 915, 936 and 962; and object and except to his failure to find:

(b) That only many thousands of miles of testing over much time can prove durability of pistons;

see defendants' deposition Exhibits D and H, and plaintiffs' Exhibit 42c, and the testimony of defendants' witness Stellman, Deposition R. pp. 451 to 457, and plaintiffs' witnesses Gulick R. pp. 802 to 810, Burns R. p. 677, Jeffries R. pp. 915, 959, 960 and 963; and object and except to his failure to find:

(c) That in 1911 and 1914 pistons were block tested and road tested in automobiles operated by engineers in the ordinary course of their business and pleasure, for many thousands of miles and over long periods of time;

see testimony of defendants' witness Stellman, Deposition R. pp. 451 to 457, and R. p. 473, Dorris R. pp. 1075 to 1076, 1082, 1083, and 1086 to 1089, and see defendants' deposition Exhibits D and H, and plaintiffs' Exhibit 42c, and the testimony of plaintiffs' witnesses Murphy R. pp. 653 and 654, Burns R. pp. 674, 676, 677, 691, to 692, Gulick R. pp. 803 to 810 and 822 to 823, and Jeffries R. pp. 914, 916 and 976, and object and except to his failure to find:

(d) That external observation of the motor, listening to the motor, observing behavior of the motor under different conditions was the common method of testing pistons in 1911 and 1914;

see testimony of Burns R. pp. 686, 691 and 692, Gulick R. pp. 809 and 810, and see Franklin Company Experimental Records, defendants' Exhibits D and H, and plaintiffs' Exhibit 42c; and object and except to his failure to find:

(e) That experimentation concludes only when pistons go into production;

see testimony of defendants' witness Dorris R. p. 1076.

EXCEPTION NO. 38.

Plaintiffs object and except to the Master's Finding of Fact No. 35 (M. R. p. 1102) and to each and every statement and conclusion thereof, comprising each of the following statements:

(a) "That the Monckmeier pistons, Exs. 3-V and 3-W, were in use by Gustave C. Monckmeier in this country in his automobile for more than two years prior to the Gulick application for patent; that such pistons embodied a T-slot disposed intermediate the wrist pin bosses with the horizontal of the T below the bottom ring land and with the vertical of the T intermediate the bosses;"

as not pleaded in defendants' answer, as immaterial and irrelevant; and as not proved beyond a reasonable doubt; see testimony of plaintiffs' witnesses, Sweet R. pp. 833, 834 and 835, Henderson R. pp. 847, 848 and 849, and Jeffries R. pp. 923 and 924, and defendants' witness D'Vorsky R. p. 332; and plaintiffs object and except to the statement and conclusion:

(b) "that such T-slotting functioned to compensate for expansion; that any reduction in head diameter to the horizontal slot involved mere mechanical skill;"

as contrary to the evidence; see testimony of defendants' witnesses Monckmeier R. pp. 305, 306 and 311, D'Vorsky R. pp. 336 and 343, and Stellman R. pp. 481, 556, 557 and 558; and see defendants' Exhibit 4-P; and the testimony of plaintiffs' witness Jeffries R. pp. 922, 923 and 924; and plaintiffs object and except to the statement and conclusion:

(c) "that such use of the Monckmeier pistons more than two years prior to the application of the Gulick patent in suit was open and not in secret but known to others and in fact public;"

as not proved beyond a reasonable doubt; see testimony of defendants' witness Monckmeier R. pp. 300, 303 and 319; and plaintiffs object and except to the statement:

(d) "that the testimony of Monckmeier and his corroborating witnesses is reasonably satisfactory and reliable."

as contrary to the evidence; see the testimony of plaintiffs' witnesses, Jeffries R. pp. 921 to 924, Sweet R. pp. 834, 835, 847 and 848 (as to splits in the Monckmeier pistons) and R. pp. 833 and 834 (as to the date of change from iron to aluminum) and Henderson R. pp. 848 and 849 (as to splits in the Monckmeier pistons) and R. pp.

848 and 849 (as to date of change from iron to aluminum pistons) and Jeffries R. pp. 921 to 924; and see the sketch defendants' Exhibit 4-Q (made by D'Voraky when he saw only the aluminum pistons defendants' Exhibit 3-W, R. p. 334).

EXCEPTION NO. 39.

Plaintiffs object and except to the failure of the Master to adopt items 1 to 8 inclusive, of pages 29 to 31 inclusive, of plaintiffs' Proposed Findings of Fact, summarized briefly as follows:

> That the evidence does not establish beyond a reasonable doubt that Monckmeier had a split skirt piston like defendants' Exhibits 3-V and 3-W, or had such pistons in public use more than two years prior to Gulick's filing date; and that such pistons as Monckmeier may have made, which he claims were split, were only experimental and were abandoned; and that there is no contemporaneous documentary evidence showing that Monckmeier ever had a split skirt piston or publicly used any split skirt piston;

see evidence cited in support of plaintiffs' Exception No. 38, *supra*.

EXCEPTION NO. 40.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 36 (M. R. p. 1102)

> "That for more than two years prior to the application of the patent in suit, Walter L. Schoengarth made and sold at Ironwood, Michigan, pistons of the construction shown and described in the Schoengarth patent 1,174,902 but omitting the adjusting device; that such pistons functioned to compensate for expansion; that any reduction of head diameter to circumferential slot was a matter within the purview of a skilled mechanic; and that the Schoengarth pistons were publicly used and sold in this country more than two years prior to Gulick's application for patent. That for more than two years prior to the application of the patent in suit, Walter L. Schoengarth made and sold at Ironwood, Michigan, pistons of the construction shown and de-

scribed in the Schoengarth patent 1,174,092. That the testimony of Schoengarth is reasonably corroborated, satisfactory and reliable. That the omission of the adjusting devices is within the purview of any skilled mechanic."

as immaterial and irrelevant, as not proved beyond a reasonable doubt, and as contrary to the evidence; see the testimony of defendants' witnesses Schoengarth R. pp. 900, 908 and 910, Stellman, R. p. 560, and plaintiffs' witness Dr. Jeffries, R. pp. 915 to 917, 1063 and 1054.

EXCEPTION NO. 41.

Plaintiffs object and except to the failure of the Master to adopt all of plaintiffs' Proposed Findings of Fact, pages 32 and 33, briefly summarized as follows:

That this piston described in the Schoengarth patent does not have the structure, mode of operation, or results of any patent in suit and only operates like and only accomplishes the results of a conventional trunk type piston; that the piston described in the Schoengarth patent, with the adjusting device omitted, does not have the structure, mode of operation or accomplish the results of any patent in suit;

as shown by the evidence; see the testimony of defendants' witness Dorris R. p. 1078 and plaintiffs' witness Jeffries R. pp. 915 to 917, and

that Schoengarth did not prove either public use or sale of any piston like that shown in his patent more than two years before the filing date of any patent in suit;

as shown by the evidence; see the testimony of defendants' witness Schoengarth R. pp. 900, 908 and 909.

EXCEPTION NO. 42.

Plaintiffs object and except to the following statements and conclusions in the Master's Finding of Fact No. 37 (M. R. pp. 1162 and 1163)

"That one Elmer C. Long, in March, 1916 exhibited to Louis Stellman and William Venner at Syracuse, New York, a six slotted piston of the construction shown by Exs. Y and A re-

spectively. That six slotted pistons of the construction shown in Exhibit A and also in Exhibit F were sold by Long to Venner while Venner was at South Bend, Indiana, as early as 1917, and that during the year, 1917, Venner sold such pistons as replacements in Franklin automobiles; and that Venner continued to sell such pistons furnished him by Long and of the construction shown in Exs. E, F and G from 1918 to 1926. That a piston of the construction shown in the Long patent 1,395,441 with a T-slot was tested at Franklin Automobile Co., at Syracuse, New York, July, 1918 as admitted by plaintiff's witness, Burns. That during the year 1918, Elmer C. Long manufactured and sold six-slotted pistons of the construction shown in Exs. E, F, G and R for replacement in automobiles and that such pistons were actually used during the year, 1918 in automobiles; * * *" and

* * * * *

"That the Long pistons of 1917-1926 were successful pistons and from 1917 to 1922 were the only commercial pistons which automatically compensated for expansion."

as immaterial, as not proved beyond a reasonable doubt, as unsupported by any contemporaneous documentary evidence; and as contrary to the evidence; see testimony of defendant's witness Stellman, Deposition R. pp. 458, 459, 456, 562, 570, and Venner Deposition R. pp. 360, 361; and plaintiff's witness Murphy, R. p. 653; also see plaintiff's Exhibits Nos. 42, 43, 44 and 45; and see interference decisions plaintiff's Exhibits 67-B, pp. 1536 and 1537, 67-C, p. 1539, 69-A, p. 1550, 70-A, pp. 1566 and 1569, 70-B, p. 1571.

EXCEPTION NO. 43.

Plaintiffs object and except to the Master's failure to adopt items 1 to 3, inclusive, of page 35 of plaintiff's proposed Findings of Fact, summarized briefly as follows:—

That the evidence does not establish beyond a reasonable doubt that Long ever had any pistons like Exhibits E, F, G, R or 3-F or like the

pistons shown in his patents 1,395,441 or 1,872,772, prior to Gulick's filing date or prior to Gulick's invention or prior to Schmiedeknecht or Mooers; that priority as between Gulick and Long on issues the same as made up here was decided by all the tribunals of the Patent Office and of the courts reviewing those decisions in favor of Gulick; and that the great majority of the commercially used Long pistons were made under license under the applications from which the patents in suit eventuated.

as shown by the evidence cited in support of plaintiff's Exceptions Nos. 2, item (e) and 42.

EXCEPTION NO. 44.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 38 (M. R. p. 1104)

"That defendants' pistons, Ex. 1, BBB, CCC, 3-J, 3-O and 8 do not embody the structure, function and mode of operation of the Gulick patent in suit."

as contrary to the evidence; see testimony of defendants' witnesses Stellman, R. pp. 526, 527, 530, 536, 566, 567, 568, 579 and 580, Dorris, R. pp. 1070 to 1072, and Dr. Jeffries, made defendants' witness on cross examination exceeding the direct over plaintiffs' objection, R. pp. 124 and 174 as to Exhibit BBB, and plaintiffs' witness Jeffries R. pp. 82, 83, 84 and 158 to 160 as to Exhibit 1, R. pp. 124 and 190 as to Exhibit BBB, R. pp. 199 and 200 as to Exhibit CCC, R. p. 955 as to Exhibit 3-J, R. p. 956 as to Exhibit 3-O, and R. pp. 85 and 161 as to Exhibit 8.

EXCEPTION NO. 45.

Plaintiffs object and except to the failure of the Master to adopt items 3 to 8, inclusive, pages 22 and 23 of plaintiffs' Proposed Findings of Fact, summarized briefly as follows:

That each of defendants' pistons, defendants' Exhibits 1, BBB, CCC, 3-J, 3-O and 8 embody the invention claimed in each of the claims of the Gulick patent upon which plaintiffs rely and

each of said defendants' pistons have the same or substantially the same structure, function and mode of operation and accomplish the same or substantially the same results as the Gulick patented piston as defined by said claims;

as shown by the evidence cited in support of plaintiffs' Exception No. 44.

EXCEPTION NO. 46.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 39 (M. R. p. 1104)

"That defendants' pistons, Exhibits 1, BBB, CCC and 8 do not embody the structure, function and mode of operation of the Jardine patent in suit."

as contrary to the evidence; see the testimony of defendants' witness Stellman, R. pp. 566, 530, 552, 553, 579, 580, 581, 567 and 568, and Jeffries, made defendants' witness on cross examination exceeding the direct over plaintiffs' objection R. pp. 123, 124 and 173 to 175 as to Exhibit BBB, and plaintiffs' witness Jeffries, R. pp. 81 to 84 as to Exhibit 1, R. pp. 190 and 199 as to Exhibit BBB, R. p. 198 as to Exhibit CCC, and R. pp. 84 to 86 as to Exhibit 8.

EXCEPTION NO. 47.

Plaintiffs object and except to the failure of the Master to adopt items 3 to 6 inclusive, page 24 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

That each of defendants' pistons, defendants' Exhibits 1, BBB, CCC, and 8 embody the invention claimed in each of the claims of the Jardine patent upon which plaintiffs rely and each of said defendants' pistons have the same or substantially the same structure, function and mode of operation and accomplish the same or substantially the same results as the Jardine patented piston as defined by said claims.

as shown by the evidence cited in support of plaintiffs' Exception No. 46.

EXCEPTION NO. 48.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 40 (M. R. p. 1104)

> "That defendants' pistons, Exs. 1, BBB, CCC do not embody the structure, function and mode of operation of the Maynard patent in suit."

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. [illegible], and Dr. Jeffries, made defendants' witness on cross examination, exceeding the direct over plaintiffs' objection, R. pp. 124 and 174 as to Exhibit BBB, and plaintiffs' witness Jeffries, R. pp. 80 to 82, 84 and 122 to 124 as to Exhibit 1, R. p. 190 as to Exhibit BBB, and R. p. 200 as to Exhibit CCC.

EXCEPTION NO. 49.

Plaintiffs object and except to the failure of the Master to adopt items 3 to 6 inclusive, page 25, of plaintiffs' Proposed Findings of Fact, summarized briefly as follows:

> That each of defendants' pistons, defendants' Exhibits 1, BBB, CCC embody the invention claimed in each of the claims of the Maynard patent upon which plaintiffs rely and each of said defendants' pistons have the same or substantially the same structure, function and mode of operation and accomplish the same or substantially the same results as the Maynard patented piston as defined by said claims.

as shown by the evidence cited in support of plaintiffs' Exception No. 48.

EXCEPTION NO. 50.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 41 (M. R. p. 1104)

> "That defendants' pistons, Exs. 1, BBB, CCC, 3-C, 8 and 9 do not embody the structure, function and mode of operation of the Mocers patent in suit."

as contrary to the evidence; see testimony of defendants' witnesses Stellman R. pp. 517, 518, 525 and 526,

Dorris R. pp. 1071 and 1072, and Jeffries, made defendants' witness on cross examination exceeding the direct over plaintiffs' objection, R. pp. 109 and 110 as to Exhibit BBB, and plaintiffs' witness Jeffries R. pp. 83, 84, 111 and 128 as to Exhibit 1, R. pp. 199 and 234 as to Exhibit BBB, R. pp. 199, 200 and 234 as to Exhibit CCC, R. pp. 966 and 967 as to Exhibit 3-O, and R. pp. 85, 86 and 112 and 113 as to Exhibits 8 and 9.

EXCEPTION NO. 51.

Plaintiffs object and except to the failure of the Master to adopt items 3 to 8 inclusive, pages 27 and 28 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

> That each of defendants' pistons, Exhibits 1, BBB, CCC, 3-O, 8 and 9 embody the invention claimed in each of the claims of the Mooers patent upon which plaintiffs rely and each of said defendants' pistons have the same or substantially the same structure, function and mode of operation and accomplish the same or substantially the same results as the Mooers patented piston as defined by said claims.

as shown by the evidence cited in support of plaintiffs' Exception No. 50.

EXCEPTION NO. 52.

Plaintiffs object and except to each and every statement and conclusion of the Master's Findings of Fact No. 42 (M. R. p. 1194)

> "That defendants' piston, Ex. 1 does not embody the structure, function and mode of operation of the Schmiedeknecht patent in suit."

as contrary to the evidence; see the testimony of plaintiffs' witness Jeffries R. pp. 83, 84, 115, 116 and 117.

EXCEPTION NO. 53.

Plaintiffs object and except to the failure of the Master to adopt item 3 page 26 of plaintiffs' proposed Findings of Fact, summarized briefly as follows:

> That defendants' piston, plaintiffs' Exhibit 1 embodies the invention claimed in each of the

claims of the Schmiedeknecht patent upon which plaintiffs rely and said defendants' piston has the same or substantially the same structure, function and mode of operation and accomplish the same or substantially the same results as the Schmiedeknecht patented piston as defined by said claims;

as shown by the evidence cited in support of plaintiffs' Exception No. 52.

EXCEPTION NO. 54.

Plaintiffs object and except to each and every part of each of the following statements and conclusions of the Master's Finding of Fact No. 43 (M. R. p. 1104)

(a) "That the prior art requires restriction of the (Gulick) patent to the employment of webs which are of sufficient length and thinness to permit flaring of those webs at the top of the skirt;"

as contrary to the evidence; see testimony of defendants' witness Stellman R. p. 566 and plaintiffs' witness Jeffries R. p. 952; and defendants' Exhibit 4-L, the Gulick file wrapper showing consideration of the same prior art patents here relied upon; and see plaintiffs' Exhibits 67 to 70 and 84, showing contrary findings by the Tribunals of the Patent Office and the Courts of the District of Columbia on substantially the same prior art; and see evidence cited in support of plaintiffs' Exceptions Nos. 1 and 2, *supra*, and excepts and objects to the following statement and conclusion:

(b) "that Exhibit 1 does not employ such characteristic webs;"

as contrary to the evidence; see testimony of defendants' witness Stellman R. p. 526, and plaintiffs' witness Jeffries R. pp. 81, 82, 84, 158 to 160; and contrary to the demonstrations of the flexibility of the webs of Exhibit 1 piston before the Court by plaintiffs' witness Jeffries R. p. 954; and see evidence cited in support of plaintiffs' Exception No. 44, *supra*, and objects and excepts to the statements and conclusion:

(c) "that Exhibit 3 does not employ such characteristic webs; and"

as contrary to the evidence; see the testimony of defendants' witness Stellman R. p. 580 and plaintiffs' witness

Jeffries R. pp. 84, 85 and 161; and contrary to the Findings of the Patent Office in the Interferences shown in plaintiffs' Exs. 67 to 70 and 84 that the Gulick patent and the Ray Day application plaintiffs' Exhibit 85 embodied the same invention, see defendants' Exhibit 4-L, pp. 1886 to 1918 and see evidence cited in support of plaintiffs' Exception No. 44, *supra*; and objects and excepts to the statement and conclusion:

(d) "that Exhibits BBB and CCC * * * employ no webs at all."

as contrary to the evidence cited in support of plaintiffs' Exception No. 44, *supra*.

EXCEPTION NO. 55.

Plaintiffs object and except to each and every part of each of the following statements and conclusions of the Master's Finding of Fact No. 44 (M. R. p. 1104)

(a) "that the prior art requires restriction of the patent (Jardine) to the employment of webs which are of sufficient lengths and thinness to permit fixing of these webs at the top of the skirt;"

as contrary to the evidence; see testimony cited in support of plaintiffs' Exception No. 16; and excepts to the statement and conclusion.

(b) "that Ex. 1 does not employ such characteristic webs;"

as contrary to the evidence cited under item (b) of plaintiffs' Exception No. 54, *supra*; and excepts to the statement that

(c) "that Ex. 8 does not employ such characteristic webs;"

as contrary to the Master's holding (M. R. p. 1104) and as contrary to the evidence cited under item (c) of plaintiffs' Exception No. 54, *supra*; and excepts to the statement

(d) "that Exs. BBB and CCC * * * employ no webs at all."

as contrary to the evidence cited under (d) of plaintiffs' Exception No. 54, *supra*.

EXCEPTION NO. 56.

Plaintiffs object and except to the Master's Finding of Fact No. 45 (M. R. p. 1104)

> "That the Maynard patent in suit describes a piston structure in which automatic compensation is not secured unless the groove E is cut into the webs F sufficiently and beyond the inside of the piston head flange to secure web extensions at the top of sufficient length and thinness to permit flexing of these web extensions at the top of the skirt;"

as contrary to the evidence cited in support of plaintiffs' Exception No. 26, *supra*; and excepts to the statement and conclusion:

> "that Ex. 1 does not employ such characteristic webs;"

as contrary to the evidence cited in item (b) of plaintiffs' Exception No. 54, *supra*; and excepts to the statement and conclusion:

> "that Exs. BBB and CCC employ no webs at all."

as contrary to the evidence cited in item (d) of plaintiffs' Exception No. 54, *supra*.

EXCEPTION NO. 57.

Plaintiffs object and except to each of the following statements and conclusions of the Master's Finding of Fact No. 46 (M. R. p. 1105)

> "* * * that the prior art requires such a restriction;"

as contrary to the evidence cited in support of plaintiffs' Exception No. 31, *supra*; and plaintiffs except to the statement and conclusion:

> "that in Exs. 1, BBB, CCC, 3-O, 8 and 9 the connectors are heavy and not of a structure as described in the Mooers patent and"

as contrary to the evidence cited in support of plaintiffs' Exception No. 50, *supra*.

EXCEPTION NO. 58.

Plaintiffs object and except to the statement and conclusion of the Master in his Finding of Fact No. 47 (M. R. p. 1105)

"that in Ex. 1 each wrist pin boss is supported intermediate its ends on the web and not as described and claimed in the Schmiedeknecht patent."

as contrary to the evidence cited in support of plaintiffs' Exception No. 52, *supra*.

EXCEPTION NO. 59.

Plaintiffs object and except to each and every part of the following statement and conclusion of the Master's Finding of Fact No. 48 (M. R. p. 1105)

"That in Ex. 1 automatic compensation is accomplished by what has been termed the 'Keystone relief' and not by any web flexibility at the top;"

as contrary to the evidence cited under plaintiffs' Exceptions Nos. 44, 46, 48 and 50.

EXCEPTION NO. 60.

Plaintiffs object and except to each and every part of the following statement and conclusion of the Master's Finding of Fact No. 49 (M. R. p. 1105)

"that such construction and arrangement does not secure the mode of operation contemplated by the Gulick and Jardine patents."

as contrary to the evidence cited in support of plaintiffs' Exceptions Nos. 44 and 46, *supra*.

EXCEPTION NO. 61.

Plaintiffs object and except to each of the following statements and conclusions of the Master's Finding of Fact No. 50 (M. R. p. 1105)

"That Exs. BBB and CCC do not employ any webs connecting the head with the skirt and, therefore, no webs of such flexibility as contemplated by the Gulick, Jardine and even Maynard patents, if the latter has such webs having such characteristics."

as contrary to the evidence cited in support of plaintiffs' Exceptions Nos. 44, 46, 48, 50, 54, 55 and 56.

EXCEPTION NO. 62.

Plaintiffs object and except to each and every statement and conclusion of the Master's Finding of Fact No. 51 (M. R. p. 1105)

> "That defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O, 8 and 9 employ the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent No. 1,153,902 and Exs. 8 and 9, also the Chenard & Walcker French patent No. 468,595"

as contrary to the evidence; see the testimony of defendants' witness Stellman R. pp. 529, 530, 531, 552, 553, 584, 585 and 590 as to Exhibit 1; R. pp. 567 and 568 as to Exhibit BBB; and R. p. 528 as to Exhibit CCC and plaintiffs' witness Jeffries made defendants' witness on cross examination exceeding direct over plaintiff's objection R. pp. 109 and 110 and plaintiffs' witness Jeffries R. pp. 207, 208, 222 and 248.

EXCEPTIONS NOS. 63 TO 97 INC.

Plaintiffs object and except separately to each and every one of the Master's Conclusions of Law Nos. 11 to 42 inclusive, and Nos. 44 to 46, and except and object to each and every statement and conclusion therein contained and set forth as follows:

Plaintiffs' Exception No.	
63	"11 That the Gulick patent is invalid and void as to all claims in issue.
64	"12 That the Gulick patent is invalid and void as to all claims in issue for want of invention.
65	"13 That the Gulick patent is invalid and void as to claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 38, 42 and 43, because (a) of abandonment—at large—by Gulick and plaintiff and intervening privities in title, and (b) of public use by Gulick in this country for more than two years prior to his application for patent.
66	"14 That the Gulick patent is invalid and void as to all claims in issue, additional to those recited in conclusion 13, (a) for want of invention over the pistons abandoned by Gulick and plaintiffs and intervening privities in title for want of invention, and (b) over the

Plaintiffs' Exception No.

pistons in public use by Gulick more than two years prior to his application for patent.

67 "15 That the Gulick patent is destroyed and invalid *in toto*, because (a) of the attempt to broaden the original application as against intervening rights, (b) of material changes in the specification and claims after filing, and (c) of failure to describe and claim as required by R. S. Sec. 4888.

68 "16 That the Gulick patent is invalid and void as to claims 1, 4, 15, 25, 27, 28, 34, 36, 38, 42 and 43 because (a) the subject matter thereof was in public use in this country by Gustave C. Monckmeier more than two years prior to Gulick's application for patent and (b) the subject matter thereof was in public use and on sale in this country by Walter L. Schoengarth more than two years prior to Gulick's application for patent.

69 "17 That the Gulick patent is invalid and void as to all claims in issue additional to those recited in conclusion 16, for want of invention over pistons (a) in public use in this country by Gustave C. Monckmeier more than two years prior to Gulick's application for patent, and (b) in public use and on sale in this country by Walter L. Schoengarth more than two years prior to Gulick's application for patent.

70 "18 That the Jardine patent is invalid and void as to all claims in issue.

71 "19 That the Jardine patent is invalid and void as to all claims in issue for want of invention over the prior art.

72 "20 That the Jardine patent is invalid as to all claims in issue because of failure to describe and claim as required by R. S. Sec. 4888.

73 "21 That the Maynard patent is invalid and void as to all claims in issue.

74 "22 That the Maynard patent is invalid and void as to all claims in issue for want of invention over the prior art.

Plaintiffs' Exception No.	
75	"23 That the Maynard patent is invalid as to all claims in issue because of failure to describe and claim as required by R. S. Sec. 4888.
76	"24 That the Mocers patent is invalid and void as to all claims in issue.
77	"25 That the Mocers patent is invalid and void as to all claims in issue for want of invention over the prior art.
78	"26 That the Mocers patent is destroyed and invalid *in toto* because (a) of the attempt to broaden the original application as against intervening rights, (b) of material changes in the specification and claims after filing, and (c) of failure to describe and claim as required by R. S. Sec. 4888.
79	"27 That the Schmiedeknecht patent is invalid and void as to all claims in issue.
80	"28 That the Schmiedeknecht patent is invalid and void as to all claims in issue for want of invention over the prior art.
81	"29 That the Gulick 1911 piston, Ex. '48 was abandoned to the public by Gulick, plaintiff and intervening privities in title.
82	"30 That the Gulick 1914 piston, Ex. 51 was abandoned to the public by Gulick, plaintiff and intervening privities in title.
83	"31 That the Gulick 1911 piston, Ex. 48, was in public use in this country by Gulick for more than two years prior to his application for patent.
84	"32 That the Gulick 1914 piston, Ex. 51, was in public use in this country by Gulick for more than two years prior to his application for patent.
85	"33 That the Monckmeier pistons, Exs. 3-V and 3-W were in public use in this country for more than two years prior to Gulick's application for patent.
86	"34 That the piston disclosure in the Schoengarth patent 1,174,092 was in public use and on sale in this country for more than two years prior to Gulick's application for patent.

Plaintiffs' Exception No.

87 "35 That a piston of the construction disclosed in the Schoengarth patent 1,174,092, but without the adjusting devices, was in public use and on sale in this country for more than two years prior to Gulick's application for patent.

88 "36 That the sale and use of pistons and activities in the production and development of pistons by the following parties constitute adverse and intervening rights as against Gulick, plaintiff and intervening privities in title of the Gulick patent in suit, Elmer C. Long, Gustave C. Monckmeier, Walter L. Schoengarth, Albert L. Spillman and Kant-Skore Mfg. Co., Stephen D. Hartog, Frank Jardine and Aluminum Company of America, Howard E. Maynard and Maxwell Motor Co., Ray Day, William E. Venner, W. K. Weems and Charles Chadwick.

89 "37 That defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O and 8 do not infringe the Gulick patent in suit.

90 "38 That defendants' pistons, Exs. 1, BBB, CCC, and 8 do not infringe the Jardine patent in suit.

91 "39 That defendants' pistons, Exs. 1, BBB and CCC do not infringe the Maynard patent in suit.

92 "40 That defendants' pistons, Exs. 1, BBB, CCC, 3-O, 8 and 9 do not infringe the Mooers patent in suit.

93 "41 That defendants' piston, Ex. 1, does not infringe the Schmiedeknecht patent in suit.

94 "42 That prior art not cited in the answer may be used to show want of invention, particularly as to use of expedients.

95 "44 That plaintiff is not entitled to the relief prayed for in the Bills of Complaint, or any part thereof.

96 "45 That said Bills of Complaint be dismissed.

97 "46 That defendants have and recover against the plaintiff the costs of suit."

and object and except to each of the foregoing Conclusions of Law as based upon erroneous findings of fact as hereinbefore specifically pointed out and as based on erroneous conclusions from the evidence referred to in the foregoing Exceptions, and as based on erroneous application of the law to the facts established by the evidence, and as based on erroneous applications of the law to the Master's Findings of Fact to which plaintiff has heretofore taken specific objections and exceptions.

EXCEPTION NO. 98.

Plaintiffs object and except to the failure of the Master to conclude as a matter of law that the acts testified to by Mönckmeier with regard to the pistons, defendants' Exhibits 3-V and 3-W, constituted no more than an abandoned experiment and did not constitute any public use within the meaning or intent of the statute prior to Gulick's filing date. (For evidence see plaintiffs' Exception No. 38.)

EXCEPTION NO. 99.

Plaintiffs object and except to the failure of the Master to conclude as a matter of law that the acts testified to by Schoengarth constituted no more than an abandoned experiment and did not constitute any public use within the meaning and intent of the statute prior to Gulick's filing date. (For evidence see plaintiffs' Exception No. 40.)

EXCEPTION NO. 100.

Plaintiffs object and except to the failure and refusal of the Master to adopt as his conclusion of law, the substance of Item 6 of page 5, of plaintiffs' proposed Conclusions of Law, in that defendants are bound by the testimony of Gulick on the cross examination, exceeding the direct examination over plaintiffs' objection, that Gulick's work prior to his filing date was experimental and never amounted to public use of any piston covered by his patent in suit. (For evidence see R. pp. 754, 755 and 768.)

EXCEPTION NO. 101.

Plaintiffs object and except to the failure and refusal of the Master to conclude as proposed by plaintiffs in Items 11, 12 and 13 on page 6, plaintiffs' proposed con-

clusions of law that Gulick was the original, first and sole inventor of the invention described and claimed in the Gulick patent No. 1,815,733, and that said patent is valid and sufficient in law particularly as to claims 1, 4, 11, 12, 13, 15, 18, 22, 27, 28, 29, 30, 33, 34, 35, 36, 37, 38, 41, 42 and 43, and the Gulick patent, describing and claiming a pioneer invention, is entitled to a liberal interpretation and a broad range of equivalents. (For evidence, see that cited in Exceptions Nos. 1 to 12 inc., *supra*.)

EXCEPTION NO. 102.

Plaintiffs object and except to the failure and refusal of the Master to adopt plaintiffs' proposed conclusions of law set forth in Items 14 to 19 inclusive, pages 6 and 7 thereof, in substance that defendants have infringed the Gulick patent by the manufacture, use or sale of pistons like Defendant's Exhibits 1, 8, BBB, CCC, 3-J, 3-O, and the particular claims of the Gulick patent with reference to each exhibit as specifically set forth in plaintiffs' proposed conclusions. (For evidence, see that cited in Exceptions Nos. 44, 54, 59, 60 and 61, *supra*.)

EXCEPTION NO. 103.

Plaintiffs object and except to the Master's failure and refusal to adopt the conclusion of law proposed by plaintiffs in items 1 and 2 of page 8 of their proposed conclusions of law, in substance that Jardine was the original, first, and sole inventor of the invention disclosed and claimed in Jardine patent No. 1,763,523 and that the said Jardine patent is valid and sufficient in law particularly as to claims 1 and 2 and claims 4 to 11 inclusive thereof. (For evidence, see that cited in Exceptions Nos. 3 and 14 to 18 inc., *supra*.)

EXCEPTION NO. 104.

Plaintiffs object and except to the Master's failure and refusal to adopt the conclusion of law proposed by plaintiffs in items 3 to 6 inclusive on page 8 of their proposed conclusions, in substance that the defendants have infringed the Jardine patent No. 1,763,523 by making, using and selling, pistons like defendants' Exhibits 1, 8, BBB and CCC with respect to the claims of said patent specifically set forth with relation to each exhibit in said items of plaintiffs' proposed conclusions. (For evidence, see that cited in Exceptions Nos. 46, 55, 59, 60 and 61, *supra*.)

EXCEPTION NO. 105.

Plaintiffs object and except to the Master's failure and refusal to adopt as his conclusion of law items 1 and 2 on page 9 of plaintiffs' proposed conclusions of law, in substance that Maynard was the original, first, and sole inventor of the invention described and claimed in the Maynard patent No. 1,655,968 and that the said Maynard patent is valid and sufficient in law as to all the claims thereof. (For evidence, see that cited in Exceptions Nos. 3 and 19 to 26 Inc., *supra*.)

EXCEPTION NO. 106.

Plaintiffs object and except to the Master's failure and refusal to adopt as a conclusion of law items 3 to 5 inclusive on page 9 of plaintiffs' proposed conclusions of law, in substance that defendants infringed the Maynard patent No. 1,655,968 by making, using and selling, pistons like defendants' Exhibits 1, BBB and CCC with respect to the claims of said patent specifically set out with relation to each exhibit in the said items of plaintiffs' proposed conclusions. (For evidence, see that cited in Exceptions Nos. 48, 56, 59 and 61, *supra*.)

EXCEPTION NO. 107.

Plaintiffs object and except to the Master's failure and refusal to adopt as his conclusion of law items 1 and 2 of page 10 of plaintiffs' proposed conclusions of law, in substance that Mooers was the original, first, and sole inventor of the invention described and claimed in the Mooers patent No. 1,402,309 and that the said Mooers patent is valid and sufficient in law as to claims 1 to 4 inclusive and 6, 8, 10 and 11 thereof. (For evidence, see that cited in Exceptions Nos. 3 and 27 to 33 Inc., *supra*.)

EXCEPTION NO. 108.

Plaintiffs object and except to the Master's failure and refusal to adopt as a conclusion of law items 3 to 8 inclusive of page 10 of plaintiffs' proposed conclusions of law, in substance that defendants infringed the Mooers patent No. 1,402,309 by making, using and selling, pistons like defendants' Exhibits 1, 6, 9, BBB, CCC and 3-O with respect to the claims of said patent specifically set out with relation to each exhibit in the said items of plaintiffs' proposed conclusions. (For evidence, see that cited in Exceptions Nos. 50 and 57, *supra*.)

EXCEPTION NO. 109.

Plaintiffs object and except to the failure and refusal of the Master to adopt as his conclusion of law the substance of Items 1 and 2 on page 11 of Plaintiffs' Proposed Conclusions of Law to the effect that Schmiedeknecht was the original, first and sole inventor of the invention described and claimed in the Schmiedeknecht patent No. 1,256,265, and that the said patent is valid and sufficient in law, particularly as to claims 1 and 3 thereof. (For evidence, see that cited in Exceptions Nos. 3, 34 and 35, *supra*.)

EXCEPTION NO. 110.

Plaintiffs object and except to the Master's failure and refusal to adopt as his conclusion of law the substance of Item 3 on page 11 of Plaintiffs' Proposed Conclusions of Law to the effect that defendants have infringed claims 1 and 3 of the Schmiedeknecht patent in suit by making, using, and selling pistons like defendants' Exhibit 1. (For evidence, see that cited in Exceptions Nos. 52 and 58, *supra*.)

EXCEPTION NO. 111.

Plaintiffs object and except to the failure and refusal of the Master to adopt as his conclusion of law that the plaintiffs are entitled to the relief prayed for in each Bill of Complaint, and their costs in these suits to be taxed.

And plaintiffs file their foregoing Exceptions this 26th day of February, 1934.

Service of a copy of the foregoing, Plaintiffs' Exceptions to the Report of the Special Master, acknowledged this 26th day of February, 1934.

KWIS, HUDSON & KENT,
Solicitors for Defendants.

MEMORANDUM ON EXCEPTIONS TO MASTER'S REPORT.

(Filed July 6, 1934.)

[Case No. 4045.]

JONES, *J.*:

Upon due consideration and review of the issues and matters involved and heard before the Master in these three cases, and from a consideration of the full report of the Master, and the more than ample briefs of the parties, it is the judgment of the Court that the exceptions to the report of the Master be overruled; that the findings and conclusions of the Master be approved and adopted as those of the Court; and that the report of the Master be confirmed.

The principle reasserted in the opinion of the Supreme Court in *Radio Corporation of America vs. Radio Engineering Laboratories, Inc.*, 54 Supreme Court 752, has been noted in considering the weight to be given the earlier decisions of the Patent Office tribunals in respect of some phases of prior invention and public use. If the application of such principle is thought to be pertinent here and persuasive as against the Master's report, the eye, the understanding, and the record in the cases, in my opinion, supply the necessary weight to overcome the heavy burden cast upon the defendants.

Due exceptions may be entered for the plaintiffs, and findings and conclusions in accordance with the Master's report may be prepared and presented.

JONES,

U. S. District Judge.

July 6th, 1934.

FINAL DECREE.

(Filed July 27, 1934.)

[Case No. 4045.]

This cause having been referred to Wm. B. Woods, Esquire, of Cleveland, Ohio, as Special Master, by an Order of this Court made September 14, 1932; said cause having come to be heard before said Special Master on the pleadings and proofs and after oral arguments made and briefs submitted by counsel for plaintiffs and counsel for defendant, said Special Master having, on January 27, 1934, reported to this Court his Findings of Fact, Conclusions of Law, and his Memorandum; and plaintiffs having filed their exceptions to the Report of the Special Master and briefs having been submitted by counsel for plaintiffs and counsel for defendant;

Thereupon, upon due consideration and review of the issues, and matters involved and heard before the Master, and from a consideration of the full Report of the Master and the briefs of the parties;

IT IS ORDERED, ADJUDGED and DECREED as follows:

I.

That Plaintiffs' Exceptions to the Report of the Master be overruled; that the Findings of Fact and Conclusions of Law of the Master be approved and adopted as those of this Court, and that the Report of the Master be in all respects confirmed; but that due exceptions be entered for the plaintiffs.

That the Bill of Complaint in this cause filed by plaintiffs against defendant be, and the same hereby is, dismissed on the merits for want of equity as to each and all of the patents in suit and at plaintiffs' costs, that the costs be taxed by this Clerk of this Court and that defendant have execution therefor as at law.

JONES,
United States District Judge.

Cleveland, Ohio
July 26, 1934.

Approved as to form.

PETITION FOR APPEAL.

(Filed October 17, 1934.)

[Case No. 4045.]

Your petitioners, the above named Plaintiffs, The Cleveland Trust Company and Chrysler Corporation, each feeling itself aggrieved by the decree made and entered herein on the 27th day of July, 1934, dismissing the above entitled cause, do hereby severally and do hereby jointly appeal from said decree to the United States Circuit Court of Appeals for the Sixth Circuit for the reasons specified in the assignment of errors which is filed herewith, and each and both pray that such appeal be allowed and that a citation issue as provided by law and that a transcript of the record, proceedings, documents and exhibits upon which said decree was based, be duly authenticated and transmitted to the United States Circuit Court of Appeals for the Sixth Circuit.

Your petitioners further pray that the amount of security to be furnished by the plaintiffs may be fixed by the order allowing this appeal.

WM. C. McCOY,
F. O. RICHEY,

Solicitors for Plaintiffs, The Cleveland Trust Company, and Chrysler Corporation.

Service of the above petition and of the accompanying assignment of errors, and receipt of copies of the same, is acknowledged this 17th day of October, 1934.

KWIS, HUDSON & KENT,

Solicitors for Defendant.

ORDER ALLOWING APPEAL.

(Entered October 17, 1934 by Paul Jones, Judge.)

[Case No. 4045.]

On petition by Plaintiffs, The Cleveland Trust Company and Chrysler Corporation, for allowance of appeal to the United States Circuit Court of Appeals for the Sixth Circuit from the decree entered in the above entitled cause on the 27th day of July, 1934, the petition is

granted and it is ordered that the appeal be and the same is hereby allowed, upon giving a bond as required by law, and that a certified transcript of the record be forthwith transmitted to the United States Circuit Court of Appeals for the Sixth Circuit.

It is further ordered that the bond on appeal be fixed at the sum of $500.00.

JONES,
U. S. District Judge.

Cleveland, Ohio,
October ..., 1934.

Service of the above order and receipt of a copy of the same is acknowledged this .... day of October, 1934.

Solicitors for Defendant.

ASSIGNMENT OF ERRORS.

(Filed October 17, 1934.)

[Case No. 4045.]

Now come plaintiffs, The Cleveland Trust Company and Chrysler Corporation, and present with their accompanying petition for appeal from the final decree entered herein, the following assignment of errors, which are hereinafter grouped with respect to subject matter:

GROUP A.

Assignment of errors relating to the validity of Gulick patent No. 1,815,733.

1. The Court erred in failing to find and hold the Gulick patent No. 1,815,733 good and valid in law, particularly as to claims 1, 11, 12, 13, 15, 18, 30, 33, 35, 38,

41, 42 and 43 thereof, and in failing to sustain plaintiffs' exceptions Nos. 2, 3 and 101.

2. The Court erred in approving and adopting the Special Master's finding of fact No. 11, and in not sustaining plaintiffs' exception (No. 1) to the following statements in the said finding of fact No. 11:

(a) "That the pistons of the Gulick patent embodies the fundamental structure of the Franquist patent No. 1,153,902

(b) and that the piston of the Franquist patent is operative to substantially compensate for expansion

(c) that the piston of the Gulick patent employs essentially the webs of the Spillman & Mooers patent No. 1,092,870 and of the Chenard & Walcker French patent No. 468,595 . . .

(d) that the web construction of the Gulick patent differentiates from those of Spillman & Mooers and Chenard & Walcker simply in matter of design involving mechanical skill

(e) that splitting of the skirts of the Franquist, Spillman & Mooers and Chenard & Walcker patents by through slotting was within the purview of one skilled in the art."

3. The Court erred in approving and adopting the Special Master's conclusion of law No. 12,

"That the Gulick patent is invalid and void as to all claims in issue for want of invention."

and in not sustaining plaintiffs' exception No. 64 to the aforesaid conclusion of law.

4. The Court erred in approving and adopting the Special Master's conclusion of law No. 34,

"That the piston disclosure in the Schoengarth patent 1,174,092 was in public use and on sale in this country for more than two years prior to Gulick's application for patent."

and in not sustaining plaintiffs' exception (No. 86) to the aforesaid conclusion of law No. 34.

5. The Court erred in approving and adopting the Special Master's conclusion of law No. 35,

"That a piston of the construction disclosed in the Schoengarth patent 1,174,092, but without

the adjusting devices, was in public use and on sale in this country for more than two years prior to Gulick's application for patent."

and in not sustaining plaintiffs' exception (No. 37) to the aforesaid conclusion of law No. 35.

6. The Court erred in approving and adopting the Special Master's conclusions of law Nos. 16 and 17, that the Gulick patent is invalid and void as to all claims in issue because of pistons

"* * * (b) in public use and on sale in this country by Walter L. Schoengarth, more than two years prior to Gulick's application for patent,"

and for want of invention over such pistons, and in not sustaining plaintiffs' exceptions (Nos. 68 and 69) to the aforesaid conclusions of law Nos. 16 and 17.

7. The Court erred in approving and adopting the Special Master's finding of fact No. 36,

"That for more than two years prior to the application of the patent in suit, Walter L. Schoengarth made and sold at Ironwood, Michigan, pistons of the construction shown and described in the Schoengarth patent 1,174,092 but omitting the adjusting device; that such pistons functioned to compensate for expansion; that any reduction of head diameter to circumferential slot was a matter within the purview of a skilled mechanic; and that the Schoengarth pistons were publicly used and sold in this country more than two years prior to Gulick's application for patent. That for more than two years prior to the application of the patent in suit, Walter L. Schoengarth made and sold at Ironwood, Michigan, pistons of the construction shown and described in the Schoengarth patent 1,174,092. That the testimony of Schoengarth is reasonably corroborated, satisfactory and reliable. That the omission of the adjusting devices is within the purview of any skilled mechanic."

and in not sustaining plaintiffs' exception (No. 40) to the aforesaid finding of fact No. 36.

8. The Court erred in approving and adopting the Special Master's finding of fact No. 35 and in not sustaining plaintiffs' exception (No. 38) to the following statements in the aforesaid finding of fact No. 35:

(a) "That the Monckmeier pistons, Exhibits 3-V and 3-W, were in use by Gustave C. Monckmeier in this country in his automobile, for more than two years prior to the Gulick application for patent; that such pistons embodied a T-slot disposed intermediate the wrist pin bosses with the horizontal of the T below the bottom ring land and with the vertical of the T intermediate the bosses.

(b) that such T-slotting functioned to compensate for expansion; that any reduction in head diameter to the horizontal slot involved mere mechanical skill;

(c) that such use of the Monckmeier pistons more than two years prior to the application of the Gulick patent in suit was open and not in secret but known to others and in fact public; and

(d) that the testimony of Monckmeier and his corroborating witnesses is reasonably satisfactory and reliable."

9. The Court erred in approving and adopting the Special Master's conclusion of law No. 33:

"That the Monckmeier pistons, Exs. 3-V and 3-W were in public use in this country for more than two years prior to Gulick's application for patent."

and in not sustaining plaintiffs' exception (No. 85) to the aforesaid conclusion of law No. 33.

10. The Court erred in approving and adopting the Special Master's conclusions of law Nos. 16 and 17, that the Gulick patent is invalid and void as to all claims in issue because of pistons

"* * * (a) in public use in this country by Gustave C. Monckmeier more than two years prior to Gulick's application for patent * * *"

and for want of invention over such pistons, and in not sustaining plaintiffs' exceptions Nos. 68 and 69 to the aforesaid conclusions of law Nos. 16 and 17.

11. The Court erred in approving and adopting the Special Master's finding of fact No. 12, and in not sustaining plaintiff's exception (No. 4) to the following statements and conclusions contained in the aforesaid finding of fact No. 12,

"That by admissions of plaintiffs' witness Gulick, Gulick abandoned and had in public use in this country during the year 1911, a piston exemplified by Exhibit 48, and during the year 1914, a piston exemplified by Exhibit 51; * * *."

12. The Court erred in approving and adopting the Special Master's conclusion of law No. 31,

"That the Gulick 1911 piston, Ex. 48, was in public use in this country by Gulick for more than two years prior to his application for patent."

and in not sustaining plaintiffs' exception (No. 83) to the aforesaid conclusion of law No. 31.

13. The Court erred in approving and adopting the Special Master's conclusion of law No. 32,

"That the Gulick 1914 piston, Ex. 51, was in public use in this country by Gulick for more than two years prior to his application for patent."

and in not sustaining plaintiffs' exception (No. 84) to the aforesaid conclusion of law No. 32.

14. The Court erred in approving and adopting the statements in the Special Master's conclusions of law Nos. 13 and 14, that the Gulick patent is invalid and void as to claims 1, 4, 15, 25, 27, 28, 33, 34, 36, 38, 42 and 43, because

"* * * (b) of public use by Gulick in this country more than two years prior to his application for patent."

and as to all other claims in issue for want of invention over such pistons, and in not sustaining plaintiffs' exceptions (Nos. 65 and 66) to the aforesaid conclusions of law Nos. 13 and 14.

15. The Court erred in approving and adopting the Special Master's finding of fact No. 34 and in not sustaining plaintiffs' exception (No. 36) to the Special Master's use of the word "admission" in his finding of fact No. 34, and to the following statement and conclusion contained in said finding of fact No. 34,

(a) "* * * that the piston Exhibit 51 was not given a block test for the reason given by Gulick that he was satisfied with previous tests. * * *"

16. The Court erred in approving and adopting the Special Master's conclusion of law No. 15 and in not sus-

taining plaintiffs' exception (No. 67) to the following statement in the Special Master's conclusion of law No. 15:

"That the Gulick patent is destroyed and invalid in toto, because * * * (c) of failure to describe and claim as required by Sec. 4888 R. S."

17. The Court erred in approving and adopting the Special Master's finding of fact No. 16,

"That the Gulick patent does not describe in sufficient detail to enable one skilled in the art to reproduce the same, the length and thickness of the webs required to secure flexibility."

and in not sustaining plaintiffs' exception (No. 11) to the aforesaid finding of fact No. 16.

18. The Court erred in approving and adopting the Special Master's conclusion of law No. 15,

"That the Gulick patent is destroyed and invalid in toto, because (a) of the attempt to broaden the original application as against intervening rights, * * *"

and in not sustaining plaintiffs' exception (No. 67) to the aforesaid conclusion of law No. 15.

19. The Court erred in approving and adopting the Special Master's finding of fact No. 34 and in not sustaining plaintiffs' exception (No. 36) to the following statement and conclusion embodied in the aforesaid finding of fact No. 34,

(b) "* * * that no effort was made to place the embodiments of the 1911 and 1914 pistons in the application of the Gulick patent. * * *"

20. The Court erred in approving and adopting the Special Master's conclusion of law No. 29,

"That the Gulick 1911 piston, Ex. 48, was abandoned to the public by Gulick, plaintiff and intervening privities in title."

and in not sustaining plaintiffs' exception (No. 81) to the aforesaid conclusion of law No. 29.

21. The Court erred in approving and adopting the Special Master's conclusion of law No. 30:

"That the Gulick 1914 piston, Ex. 51, was abandoned to the public by Gulick, plaintiff and intervening privities in title."

and in not sustaining plaintiffs' exception (No. 82) to the aforesaid conclusion of law No. 30.

22. The Court erred in approving and adopting the Special Master's conclusions of law Nos. 13 and 14 and in not sustaining plaintiffs' exceptions (Nos. 65 and 66) to the statements in the Special Master's conclusions of law Nos. 13 and 14, in substance that the Gulick patent is invalid and void as to the claims in issue because the Gulick invention was abandoned—at large—to the public by Gulick and plaintiffs and intervening privities in title and for want of invention over pistons abandoned by Gulick and plaintiffs and intervening privities in title.

23. The Court erred in approving and adopting the Special Master's finding of fact No. 15,

> "That after the filing of the Gulick application, his application was materially modified, both as to the specification and claims without warrant therefor in the original disclosure."

and in not sustaining plaintiffs' exception (No. 9) to the aforesaid finding of fact No. 15.

24. The Court erred in approving and adopting the Special Master's conclusion of law No. 15 and in not sustaining plaintiffs' exception (No. 67) to the following holding in the Special Master's conclusion of law No. 15:

> "That the Gulick patent is destroyed and invalid in toto because, * * * (b) of material changes in the specification and claims after filing, * * *."

25. The Court erred in approving and adopting the Special Master's finding of fact No. 14,

> "That the Gulick specification, while pending in the Patent Office, was broadened beyond the original disclosure while pistons were produced, used, and sold by the following parties:
>
> Elmer C. Long
> Gustave C. Mendtmeier
> Walter L. Schoemgarth
> Albert L. Spillman
> Kant-Shore Mfg. Co.
> Stephen D. Hartog
> Frank Jardine
> Aluminum Co. of America
> Howard E. Maynard
> Maxwell Motor Co.
> Ray Day
> William E. Venner"

and in not sustaining plaintiffs' exceptions (Nos. 5 and 6) to the aforesaid finding of fact No. 14.

26. The Court erred in approving and adopting the Special Master's conclusion of law No. 36,

> "That the sale and use of pistons and activities in the production and development of pistons by the following parties constitute adverse and intervening rights as against Gulick, plaintiffs and intervening privities in title of the Gulick patent in suit: Elmer C. Long, Gustave C. Monckmeier, Walter L. Schoengarth, Albert L. Spillman and Kant-Skore Mfg. Co., Stephen D. Hartog, Frank Jardine and Aluminum Company of America, Howard E. Maynard and Maxwell Motor Co., Ray Day, William E. Venner, W. K. Weems and Charles Chadwick."

and in not sustaining plaintiffs' exception (No. 88) to the aforesaid conclusion of law No. 36.

27. The Court erred in approving and adopting the Special Master's finding of fact No. 37 and in not sustaining the plaintiffs' exception (No. 42) to the following statements and conclusions in the Special Master's finding of fact No. 37:

> "That one Elmer C. Long, in March, 1916 exhibited to Louis Stellman and William Venner at Syracuse, New York, a six slotted piston of the construction shown by Exhibits Y and A respectively. That six slotted pistons of the construction shown in Exhibit A and also in Exhibit F were sold by Long to Venner while Venner was at South Bend, Indiana, as early as 1917, and that during the year 1917 Venner sold such pistons as replacements in Franklin automobiles; and that Venner continued to sell such pistons furnished him by Long and of the construction shown in Exhibits E, F and G from 1918 to 1926. That a piston of the construction shown in the Long patent 1,395,441 with a T-slot was tested at Franklin Automobile Co., at Syracuse, New York, July, 1918 as admitted by plaintiffs' witness, Burns. That during the year 1918, Elmer C. Long manufactured and sold six-slotted pistons of the construction shown in Exhibits E, F, G and R for replacement in automobiles and that such pistons were actually

used during the year 1918 in automobiles; * * * That the Long pistons of 1917-1926 were successful pistons and from 1917 to 1922 were the only commercial pistons which automatically compensated for expansion. * * *"

GROUP B.

Assignment of errors relating to infringement of the Gulick patent in suit.

28. The Court erred in not holding that defendant has infringed the Gulick patent No. 1,815,733, particularly as to claims 1, 11, 12, 13, 15, 18, 30, 33, 35, 38, 41, 42 and 43 thereof, and in failing to sustain plaintiffs' exceptions Nos. 45 and 102.

29. The Court erred in approving and adopting the Special Master's finding of fact No. 38,

"That defendants' pistons, Ex. 1, * * * do not embody the structure, function and mode of operation of the Gulick patent in suit."

and in not sustaining plaintiffs' exception (No. 44) to the aforesaid finding of fact No. 38.

30. The Court erred in approving and adopting the Special Master's finding of fact No. 43 and in not sustaining plaintiffs' exception (No. 54) to the following statements and conclusions in the aforesaid finding of fact No. 43:

(a) " * * that the prior art requires restriction of the (Gulick) patent to the employment of webs which are of sufficient length and thinness to permit flexing of those webs at the top of the skirt; and

(b) that Exhibit 1 does not employ such characteristic webs * * *"

31. The Court erred in approving and adopting the Special Master's finding of fact No. 46,

"That in Ex. 1 automatic compensation is accomplished by what has been termed the 'Keystone relief' and not by any web flexibility at the top; * * * and that such a construction and arrangement does not secure the operation contemplated by the Gulick, Jardine and Maynard patents."

and in not sustaining plaintiffs' exception (No. 59) to the aforesaid finding of fact No. 48.

32. The Court erred in approving and adopting the Special Master's finding of fact No. 51,

> "That defendants' pistons, Exs. 1, * * * employ the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent No. 1,153,902 and Exs. 8 and 9, also the Chenard & Walcker French patent No. 468,595."

and in not sustaining plaintiffs' exception (No. 62) to the aforesaid finding of fact No. 51.

33. The Court erred in approving and adopting the Special Master's conclusion of law No. 37,

> "that defendant's pistons, Exs. 1, * * * do not infringe the Gulick patent in suit."

and in not sustaining plaintiffs' exception (No. 89) to the aforesaid conclusion of law.

GROUP C.

Assignment of errors relating to validity of the Jardine patent No. 1,763,523.

34. The Court erred in failing to find and hold the Jardine patent No. 1,763,523 good and valid in law, particularly as to claims 1, 2, and 4 to 11, inclusive, thereof, and in failing to sustain plaintiffs' exceptions Nos. 16 and 103.

35. The Court erred in approving and adopting the Special Master's finding of fact No. 17 and in not sustaining plaintiffs' exception (No. 13) to the following statements in the Special Master's finding of fact No. 17:

(a) "That the Jardine patent embodies the fundamental structure of Franquist patent No. 1,153,902,

(b) that it employs essentially the slipper piston structure of the Ricardo patent No. 1,294,633, and

(c) that the splitting of the slippers of the Ricardo patent was within the purview of one skilled in the art."

36. The Court erred in approving and adopting the Special Master's finding of fact No. 18,

"That the Jardine patent piston differs from the piston of the Long patent No. 1,872,772 in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 14) to the aforesaid finding of fact No. 18.

37. The Court erred in approving and adopting the Special Master's finding of fact No. 19,

"That the Jardine piston differs from the piston of the Gulick patent in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 15) to the aforesaid finding of fact No. 19.

38. The Court erred in approving and adopting the Special Master's conclusion of law No. 19,

"That the Jardine patent is invalid as to all claims in issue for want of invention over the prior art."

and in not sustaining plaintiffs' exception (No. 71) to the aforesaid conclusion of law No. 19.

39. The Court erred in approving and adopting the Special Master's finding of fact No. 20,

"That the Jardine patent does not describe in sufficient detail to enable one skilled in the art to reproduce the same, the length and thickness of the webs required to secure flexibility."

and in not sustaining plaintiffs' exception (No. 17) to the aforesaid finding of fact No. 20.

40. The Court erred in approving and adopting the Special Master's conclusion of law No. 20,

"That the Jardine patent is invalid as to all claims in issue because of failure to describe and claim as required by Sec. 4888 R. S."

and in not sustaining plaintiffs' exception (No. 72) to the aforesaid conclusion of law No. 20.

GROUP D.

Assignment of errors relating to infringement of Jardine patent in suit.

41. The Court erred in not holding that defendant has infringed the Jardine patent No. 1,763,523, particu-

larly as to claims 1, 2 and 4 to 11, inclusive, thereof, and in failing to sustain plaintiffs' exceptions Nos. 47 and 104.

42. The Court erred in approving and adopting the Special Master's finding of fact No. 39,

> "That defendant's pistons, Exhibit 1, * * * do not embody the structure, function and mode of operation of the Jardine patent in suit."

and in not sustaining plaintiffs' exception (No. 46) to the aforesaid finding of fact No. 39.

43. The Court erred in approving and adopting the Special Master's finding of fact No. 44 and in not sustaining plaintiffs' exception (No. 55) to the following statements and conclusions in finding of fact No. 44:

(a) "* * * that the prior art requires restriction of the patent (Jardine) to the employment of webs which are of sufficient lengths and thinness to permit flexing of these webs at the top of the skirt;" and

(b) that Ex. 1 does not employ such characteristic webs."

44. The Court erred in approving and adopting the Special Master's conclusion of law No. 38,

> "That defendants' pistons, Exs. 1, * * * do not infringe the Jardine patent in suit."

and in not sustaining plaintiffs' exception (No. 90) to the aforesaid conclusion of law No. 38.

GROUP E.

Assignment of errors relating to validity of the Maynard patent No. 1,655,968.

45. The Court erred in failing to find and hold the Maynard patent No. 1,655,968 good and valid in law as to all claims thereof, and in failing to sustain plaintiffs' exceptions Nos. 26 and 105.

46. The Court erred in approving and adopting the Special Master's finding of fact No. 21 and in not sustaining plaintiffs' exception (No. 19) to the following statements in the Special Master's finding of fact No. 21:

> "The Maynard patent embodies the fundamental structure of the Franquist patent No. 1,153,902, and that the splitting of the skirt by through

and through slotting was within the purview of one skilled in the art."

47. The Court erred in approving and adopting the Special Master's finding of fact No. 22,

"That the Maynard patent differs from the piston of the Jardine patent 1,763,523 in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 20) to the aforesaid finding of fact No. 22.

48. The Court erred in approving and adopting the Special Master's finding of fact No. 23,

"That the Maynard patent piston differs from the piston of the Long patent 1,395,441 in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 21) to the aforesaid finding of fact No. 23.

49. The Court erred in approving and adopting the Special Master's finding of fact No. 24,

"That the Maynard patent piston differs from the piston of the Gulick patent in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 22) to the aforesaid finding of fact No. 24.

50. The Court erred in approving and adopting the Special Master's finding of fact No. 25,

"That the Maynard patent piston differs from the piston of the Schmiedeknecht patent in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 23) to the aforesaid finding of fact No. 25.

51. The Court erred in approving and adopting the Special Master's finding of fact No. 26,

"That the Maynard patent piston differs from the piston of the Ricardo patent No. 1,294,883 in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 24) to the aforesaid finding of fact No. 26.

52. The Court erred in approving and adopting the Special Master's finding of fact No. 27,

"That the Maynard patent piston differs from the piston of the Hives patent 140,998 in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 25) to the aforesaid finding of fact No. 27.

53. The Court erred in approving and adopting the Special Master's conclusion of law No. 22,

"That the Maynard patent is invalid and void as to all claims in issue for want of invention over the prior art."

and in not sustaining plaintiffs' exception (No. 74) to the aforesaid conclusion of law No. 22.

54. The Court erred in approving and adopting the Special Master's conclusion of law No. 23,

"That the Maynard patent is invalid as to all claims in issue because of failure to describe and claim as required by R. S. Sec. 4888,"

and in not sustaining plaintiffs' exception (No. 75) to the aforesaid conclusion of law No. 23.

GROUP F.

Assignment of errors relating to infringement of Maynard patent in suit.

55. The Court erred in failing to find and hold that defendant has infringed the Maynard patent No. 1,655,968, and in failing to sustain plaintiffs' exceptions Nos. 49 and 106.

56. The Court erred in approving and adopting the Special Master's finding of fact No. 40,

"That defendant's pistons, Ex. 1, * * * do not embody the structure, function and mode of operation of the Maynard patent in suit."

and in not sustaining plaintiffs' exception (No. 48) to the aforesaid finding of fact No. 40.

57. The Court erred in approving and adopting the Special Master's finding of fact No. 45 and in not sustaining plaintiffs' exception (No. 56) to the following statements in the Special Master's finding of fact No. 45:

(a) "That the Maynard patent in suit describes a piston structure in which automatic compensation is not secured unless the groove E is cut into the webs F sufficiently and beyond the inside of

the piston head flange to secure web extensions at the top of sufficient length and thinness to permit flexing of these web extensions at the top of the skirt; and

(b) that Ex. 1 does not employ such characteristic webs."

58. The Court erred in approving and adopting the Special Master's conclusion of law No. 39,

"That the defendant's pistons, Ex. 1, * * * do not infringe the Maynard patent in suit."

and in not sustaining plaintiffs' exception (No. 91) to the aforesaid conclusion of law No. 39,

GROUP G.

Assignment of errors relating to validity of Mooers patent No. 1,402,309.

59. The Court erred in failing to find and hold that Mooers patent No. 1,402,309 is good and valid in law, particularly as to claims 1 to 4 inclusive, 6, 8, 10 and 11 thereof, and in failing to sustain plaintiffs' exceptions Nos. 31 and 107.

60. The Court erred in approving and adopting the Special Master's finding of fact No. 28,

"That the Mooers patent embodies the fundamental structure of the Franquist patent No. 1,153,902 and that the employment of narrow connectors was within the purview of one skilled in the art."

and in not sustaining plaintiffs' exception (No. 27) to the aforesaid finding of fact No. 28.

61. The Court erred in approving and adopting the Special Master's finding of fact No. 29,

"That the Mooers patent piston differs from the piston of the Spillman & Mooers patent No. 1,092,870 in suit in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 28) to the aforesaid finding of fact No. 29.

62. The Court erred in approving and adopting the Special Master's finding of fact No. 30,

"That the Mooers patent piston differs from the piston of the Chenard & Walcker patent No.

468,595 in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 29) to the aforesaid finding of fact No. 30.

63. The Court erred in approving and adopting the Special Master's finding of fact No. 31;

"That the Mooers patent piston differs from the piston of the Gulick 1911 and 1914 pistons (Exhibits 48 and 51) in matters involving mere mechanical skill."

and in not sustaining plaintiffs' exception (No. 30) to the aforesaid finding of fact No. 31.

64. The Court erred in approving and adopting the Special Master's conclusion of law No. 25,

"That the Mooers patent is invalid and void as to all claims in issue for want of invention over the prior art."

and in not sustaining plaintiffs' exception (No. 77) to the aforesaid conclusion of law No. 25.

65. The Court erred in approving and adopting the Special Master's finding of fact No. 32,

"That after the filing of the Mooers application, his application was materially modified both as to specification and claims without warrant therefor in the original disclosure."

and in not sustaining plaintiff's exception (No. 32) to the aforesaid finding of fact No. 32.

66. The Court erred in approving and adopting the Special Master's conclusion of law No. 26, which is as follows:

"That the Mooers patent is destroyed and invalid in toto because (a) of the attempt to broaden the original application as against intervening rights, (b) of material changes in the specification and claims after filing, and (c) of failure to describe and claim as required by Sec. 4888 R. S."

and in not sustaining plaintiffs' exception (No. 78) to the aforesaid conclusion of law No. 26.

GROUP H.

Assignment of errors relating to infringement of Mooers patent in suit.

67. The Court erred in failing to find and hold that defendant has infringed the Mooers patent No. 1,402,309, and in failing to sustain plaintiffs' exceptions Nos. 51 and 108.

68. The Court erred in approving and adopting the Special Master's finding of fact No. 41,

> "That defendant's pistons, Ex. 1, * * * do not embody the structure, function and mode of operation of the Mooers patent in suit."

and in not sustaining plaintiffs' exception (No. 50) to the aforesaid finding of fact No. 41.

69. The Court erred in approving and adopting the Special Master's finding of fact No. 46 and in not sustaining plaintiffs' exception (No. 57) to the following statements and conclusions included in the Special Master's finding of fact No. 46:

(a) "* * * that the prior art requires such a restriction; (of the connectors from the head to the top of the skirt in the Mooers patent to narrow connectors of restricted cross sections);

(b) that in Ex. 1 * * * the connectors are heavy and not of a structure as described in the Mooers patent * * *"

70. The Court erred in approving and adopting the Special Master's conclusion of law No. 40,

> "That defendant's pistons, Ex. 1, * * * do not infringe the Mooers patent in suit."

and in not sustaining plaintiffs' exception (No. 92) to the aforesaid conclusion of law No. 40.

GROUP I.

Assignment of errors relating to the validity of Schmiedeknecht patent No. 1,256,265.

71. The Court erred in failing to find and hold the Schmiedeknecht patent No. 1,256,265 good and valid in law particularly as to claims 1 and 3 thereof, and in failing to sustain plaintiffs' exceptions Nos. 35 and 109.

72. The Court erred in approving and adopting the Special Master's finding of fact No. 33 and in not sus-

taining plaintiffs' exception (No. 34) to the following statements in the Special Master's finding of fact No. 33:

(a) "That the Schmiedeknecht patent involves the fundamental structure of the Franquist patent No. 1,153,902 or of any trunk piston; and

(b) that it employs essentially the construction and arrangement of webs and mounting of wrist pin bosses of the Pugh British patent 17,256 of 1907 and the arrangement of the webs of the Ferry British patent No. 12,772 of 1914; and that the construction of the Schmiedeknecht patent differs from those of Pugh and Ferry patents and from a trunk piston in matters of design involving mere mechanical skill."

73. The Court erred in approving and adopting the Special Master's conclusion of law No. 38,

"That the Schmiedeknecht patent is invalid and void as to all claims in issue for want of invention over the prior art."

and in not sustaining plaintiffs' exception (No. 80) to the aforesaid conclusion of law No. 28.

GROUP J.

Assignment of errors relating to infringement of the Schmiedeknecht patent in suit.

74. The Court erred in failing to find and hold that defendant has infringed the Schmiedeknecht patent No. 1,256,265, particularly as to claims 1 and 3 thereof, and in failing to sustain plaintiffs' exceptions Nos. 53 and 110.

75. The Court erred in approving and adopting the Special Master's finding of fact No. 42,

"That defendants' piston, Ex. 1, does not embody the structure, function and mode of operation of the Schmiedeknecht patent in suit."

and in not sustaining plaintiffs' exception (No. 52) to the aforesaid finding of fact No. 42.

76. The Court erred in approving and adopting the Special Master's finding of fact No. 47, and in not sustaining plaintiffs' exception (No. 58) to the following statements and conclusions in the aforesaid finding of fact No. 47:

"* * * that in Ex. 1 each wrist pin boss is supported intermediate its ends on the web and not as described and claimed in the Schmiedeknecht patent."

77. The Court erred in approving and adopting the Special Master's conclusion of law No. 41,

"That defendant's piston, Ex. 1, does not infringe the Schmiedeknecht patent in suit."

and in not sustaining plaintiffs' exception (No. 93) to the aforesaid conclusion of law No. 41.

GROUP K.

GENERAL ASSIGNMENT OF ERRORS.

78. The Court erred in confirming the Report of the Special Master.

79. The Court erred in not granting plaintiffs the relief prayed for in the Bill of Complaint. (Plaintiffs' exceptions Nos. 95 and 111.)

80. The Court erred in dismissing the Bill of Complaint. (Plaintiffs' exception No. 96.)

81. The Court erred in assessing the costs of the suit against plaintiffs. (Plaintiffs' exceptions Nos. 97 and 111.)

Wherefore, plaintiffs pray that the said decree may be reversed and for such other and further relief as to the Court may seem just and proper.

Chrysler Corporation.

Dated Oct. 17, 1934.

CITATION.

(Filed October 20, 1934.)

[Case No. 4045.]

UNITED STATES CIRCUIT COURT OF APPEALS
FOR THE SIXTH CIRCUIT.

To The Schriber-Schroth Company, Greeting:

You are hereby cited and admonished to be and appear at a session of the UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SIXTH CIRCUIT, to be holden at the City of Cincinnati, in said Circuit, on the* 16th day of November next, pursuant to an appeal filed in the Clerk's office of the District Court of the United States for the Northern District of Ohio, wherein The Cleveland Trust Company, and the Chrysler Corporation, are appellants and you are appellee to show cause, if any there be, why the decree rendered against the said appellants as in the said petition for appeal mentioned, should not be corrected, and why speedy justice should not be done to the parties in that behalf.

WITNESS the Honorable Charles Evans Hughes, Chief Justice of the United States, this 17th day of October in the year of our Lord one thousand nine hundred and thirty-four and of the Independence of the United States of America the one hundred and fifty-ninth.

PAUL JONES,
Judge of the District Court.

*Not exceeding 30 days from day of signing.

Service of the above citation is hereby acknowledged and appearance of appellee is hereby entered.

KWIS, HUDSON & KENT,
JOHN H. BAUMINGA.

October 20, 1934.

BOND ON APPEAL.

(Filed October 23, 1934.)

[Case No. 4045.]

KNOW ALL MEN BY THESE PRESENTS, that we, The Cleveland Trust Company and Chrysler Corporation, bodies corporate, as principals, and American Surety Company of New York, 100 Broadway, New York City, a body corporate, as surety, are held and firmly bound unto The Schriber-Schroth Company, of Akron, Ohio, in the full and just sum of $500.00 to be paid to the said The Schriber-Schroth Company, its certain attorneys, successors, or assigns; to which payment well and truly to be made we bind ourselves and our successors, jointly and severally with these presents. Signed with our seals and dated this 22nd day of October, in the year of our Lord, One Thousand Nine Hundred and Thirty-four.

WHEREAS, lately at a session of the District Court of the United States for the Eastern Division of the Northern District of Ohio, in a suit pending in said Court between The Cleveland Trust Company, Chrysler Corporation, plaintiffs, and The Schriber-Schroth Company, defendant, a decree was entered against the said The Cleveland Trust Company and Chrysler Corporation, and the said plaintiffs have prosecuted an appeal in the United States Circuit Court of Appeals for the Sixth Circuit, to reverse the decree in the aforesaid suit, and a citation directed to the said The Schriber-Schroth Company, citing and admonishing it to be and appear at the United States Circuit Court of Appeals for the Sixth Circuit, at Cincinnati, Ohio, within 30 days from the date of such citation.

Now, the condition of the above obligation is such that if the said The Cleveland Trust Company and Chrysler Corporation shall prosecute said appeal to effect, and answer all damages and costs if they fail to make their appeal good, then the above obligation to be void, otherwise to remain in full force and effect,

THE CLEVELAND TRUST COMPANY.

STIPULATION THAT APPEALS IN CAUSES NOS. 4045, 4046 AND 4047 BE CONSOLIDATED IN ONE PRINTED TRANSCRIPT OF RECORD, THAT EXHIBITS USED THEREIN MAY BE USED IN EACH OF SAID CAUSES AND THAT REPETITION OF SIMILAR PLEADINGS IN EACH BE ELIMINATED.

(Filed March 2, 1935.)

[Case No. 4045.]

It is hereby stipulated by and between the respective parties to the above entitled causes, by their counsel, as follows:

That on the appeals of the above causes the record is to be consolidated in one printed transcript of record and that the exhibits referred to therein may be used in each of said causes.

That where pleadings or other papers appear in substantially the same form in more than one case it will be sufficient to print such papers in the transcript only in one case with suitable references thereto in the other cases, reprinting in such other cases only those portions of the papers which differ from those of the first case.

EVANS AND McCOY,
Counsel for Appellant.

KERR, HUDSON & KNUT,

ORDER CONSOLIDATING APPEALS IN ONE PRINTED TRANSCRIPT OF RECORD THAT EXHIBITS USED THEREIN MAY BE USED IN EACH OF SAID CAUSES, AND FURTHER ORDERING ELIMINATION OF REPETITION OF SIMILAR PLEADINGS IN EACH CAUSE.

(Entered March 2, 1925 by Paul Jones, Judge.)

[Case No. 4965.]

Pursuant to stipulation filed herein, it is ordered that on the appeals of the above causes the record is to be consolidated in one printed transcript of record and that the exhibits referred to therein may be used in each of said causes.

It is further ordered that where pleadings or other papers appear in substantially the same form in more than one case it will be sufficient to print such papers in the transcript only in one case with suitable references thereto in the other cases, reprinting in such other cases only those portions of the papers which differ from those of the first case.

STIPULATION RE DIGEST OF EXHIBITS.

(Filed May 4, 1925.)

[Case No. 4965.]

It is hereby stipulated and agreed by and between counsel for the parties hereto, this Honorable Court consenting, that plaintiff's documentary exhibits as follows:

2A, 2B, 3A, 3B, 3C, 3D, 4A, 4B, 4C, 4D, 5A, 5B, 5C and 5D, and defendant's documentary exhibits as follows:

X, AA, 4-E, 5-F1 to 5-F12, inclusive, 5-G, 5-H1, 5-H2, 5-H3 and 5-I, be incorporated and printed for the record

on appeal in digest form and that the attached digests of said exhibits be substituted in the printed record for the originals of each of the aforesaid.

It is further stipulated and agreed that each of the aforesaid original exhibits, plaintiffs' exhibits 2A, 2B, 2C, 2D, 4A, 4B, 4C, 4D, 5A, 5B, 5C and 5D, and defendant's exhibits 1, 4A, 4B, 5-F1 to 5-F16, inclusive, 5-G, 5-H1, 5-H2, 5-H3 and 6-I to material among those exhibits withdrawn to be forwarded to the Clerk of the Circuit Court of Appeals for the Sixth Circuit for the hearing on appeal in accordance with the stipulation on that matter.

STIPULATION RE CERTIFICATION OF RECORD.

(Filed May 6, 1935.)

[Case No. 4045.]

In accordance with Section 6 of Rule 44 of the general rules of this Court, it is hereby agreed that the record as presented to the Clerk by the printer, may be certified by the Clerk as required by law and the rules of the Appellate Court, as a true, full and complete copy of the original pleadings, papers and orders used on the trial of this cause, as set forth in the precipe for transcript, without further comparison by the Clerk.

EVANS & McCOY,
Attorneys for Plaintiffs.

KWAN, HUDSON & KNOX,
Attorneys for Defendant.

DEFENDANTS' MOTION FOR LEAVE TO ADD TO THE RECORD IN THE ABOVE-ENTITLED CAUSE DEFENDANTS' COUNTER PRAECIPE AND CERTAIN LETTERS.

(Filed May 14, 1935.)

[Case No. 4045.]

Now come defendants in the above-entitled causes and respectfully petition this Court for leave to enter in the appeal record in the above-entitled causes, Defendants' Counter Praecipe, filed herewith, and letters noted in the praecipe, and copies of which are attached to the praecipe. These letters are the following:

1. Letter of Wm. B. Woods, Special Master, dated December 30, 1933, and addressed to counsel for the respective parties, reading as follows:

"In Re: The Cleveland Trust Co., Chrysler Corporation, Plaintiffs, vs. The Schriber-Schroth Co., vs. The Aberdeen Motor Supply Co., vs. The F. E. Rowe Sales Co., Defendants.

Gentlemen:

Herewith I hand you draft copy of my report as Special Master in this suit.

"If there are errors or corrections to which you would call attention, the Master will consider and make corrections insofar as he believes proper and in keeping with his views as expressed in the report. I would be obliged if I could hear from you not later than January 15th, 1934, after which time I hope to have the report in final form for filing.

"In making such suggestions, I would also be obliged if you would return your draft copy so that any changes can be made therein and it will be returned to you as the report is filed.

Yours very truly,

Wm. B. Woods (signed)
Special Master."

To this letter defendants' counsel replied by making suggestions, many of which were adopted by the Master.

2. To this letter of the Master, plaintiff's counsel, however, replied as follows:

"In Re: The Cleveland Trust Co., Chrysler Corporation, Plaintiffs, vs. The Schriber-Schroth Co., vs. The Aberdeen Motor Supply Co., vs. The F. E. Rowe Sales Co., Defendants.

"We received the copy of your draft report in the above entitled causes and we do not believe that there are any errors or corrections in this report to which we might call your attention which would be in keeping with the views which you have expressed in your report.

"If you change any of the pages before you file the report, would you please send us copies of the amended pages that we may substitute them in the copies of the report which you sent us? Will you also advise us when the report is filed?

"We are sending a copy of this letter to Mr. Bruninga.

"Thanking you for your courtesies in the premises, we remain

Very truly yours,

F. O. Richey (signed)
Wm. C. McCoy (signed)"

The above letter was written by the Special Master in pursuance to his duties as Special Master and was replied to by plaintiff's counsel in the same way and should, therefore, be a part of the record in this cause for the following reasons:

I. The Master's letter submitted a draft report and it was the duty of counsel to file objections or exceptions to this draft report, at least in the form of suggestions or corrections. As was said by Judge Ray in *Decker v. Smith*, 225 Fed. 776 (N. D. Y. N.) l.c. 777:

> "The object of filing objections with the master to his draft or proposed report is to give him an opportunity to correct his report, reconsider any point objected to, and decide differently if he on reconsideration deems himself in error."

This view was affirmed by the Circuit Court of Appeals for the Eighth Circuit in *American Surety Co. v. Dick*, 23 F. (2d) 464, 467.

In view of the failure of plaintiff to file exceptions to the draft report there is a question of whether plaintiff has any standing; and, although this Court did not rule upon that question, the Court of Appeals can at least give the situation consideration, particularly in view of plaintiff's 111 exceptions before this Court, and in view of what here follows:

II. Throughout the briefs before this Court plaintiff's counsel attacked the Master's Report in a manner not merely to show that the Master had committed errors of law or that his findings were not supported by the evidence, but the briefs went further, even to the extent of taking advantage of typographical errors; an example of the latter is Plaintiff's Reply Brief (pp. 21-22) as follows:

> "The pother about Claim 10 of *the* Long patent is unnecessary and immaterial. That claim is not in the Gulick patent. The Master, at page 85,

erroneously said that Claim 27 of Gulick was the same as Claim 10 of Long, and at page 104 of his report erroneously said that Claim 13 of Gulick was the same as Claim 10 of Long. Claim 10 of Long does not appear in the Gulick patent at all. It does not, therefore, matter that this claim reads 'word for word' upon any of the prior art, if it does. None of the Gulick claims read word for word on the prior art and even if they did, there would be no anticipation or no invalidating of the claims unless there was identity or substantial identity of operation and result."

Another example, but more mild, is found in Plaintiff's Brief (p. 3) as follows:

"It is no exaggeration, we think, to say that the learned Master has reported contrary to every one of these Patent Office Tribunals and Courts on substantially every ruling that any one of them has made during the prosecution of the applications for which, and the interferences after which the patents in suit issued."

In view of the attack by plaintiff's counsel, even in the first brief, we called the attention of this Court to the situation as noted above in Defendants' Brief (pp. 4-5), but still thereafter plaintiff's counsel insisted in the Reply Brief in even relying upon typographical errors, as noted above.

We believe, therefore, that in order to forestall the same situation before the Court of Appeals, it is entirely proper to include in the record before the Court of Appeals the actual situation as it existed, namely, that there were no exceptions to the Master's draft Report filed by plaintiff's counsel, nor even corrections and suggestions submitted to the Master by plaintiff's counsel, but that they, in fact, informed the Master that they had none. If these letters are not in the official files as returned by the Master, they can very readily be placed in those files as the Master has them undoubtedly in his possession.

Respectfully submitted,

JOHN H. BRUNNER,
Counsel for Defendants.

St. Louis, Missouri,
May 13, 1935.

Service and receipt of copy of the above Motion acknowledged, this 14th day of May, 1935.

EVANS & McCOY,
Counsel for Plaintiff.

Motion denied.

JONES,
Judge.

May 15, 1935.

ORDER DENYING MOTION OF DEFENDANTS FOR LEAVE TO ADD TO RECORD DEFENDANTS' COUNTER PRAECIPE AND CERTAIN LETTERS.

(Entered May 15, 1935 by Paul Jones, Judge.)

[Case No. 4045.]

This day these causes came on to be heard on the motion of the defendants for leave to add to the record herein the defendants' counter praecipe and certain letters, and were submitted to the Court; on consideration thereof the Court denied said motion.

PETITION TO SUPPLY LAST EIGHT PAGES MISSING FROM PLAINTIFFS' EXHIBIT 13 IN THE ABOVE CAUSE ON APPEAL.

(Filed June 18, 1935.)

[Case No. 4045.]

Now come the Plaintiffs and petition the Honorable Court for leave to supply certain pages missing from Plaintiffs' Exhibit 13 to the printer for use in preparing the Record for the Court of Appeals in the foregoing cause.

EVANS & McCOY,
Attorneys for Plaintiffs.

Service and a copy of the foregoing Petition acknowledged this 17 day of June, 1935.

KWIS, HUDSON & KENT,
Attorneys for Defendants.

Mailed with exceptions to defendants.

JONES,
Judge.

June 18, 1935.

ORDER GRANTING LEAVE TO SUPPLY LAST EIGHT PAGES OF PLAINTIFFS' EXHIBIT NO. 13.

(Entered June 18, 1935 by Paul Jones, Judge.)

[Case No. 4045.]

This day these causes came on to be heard on the petition of the plaintiffs for leave to supply the last eight pages missing from Plaintiffs' Exhibit 13 to the printer for use in preparing the record for the Court of Appeals herein, and were submitted to the Court; on consideration thereof the Court granted said petition, to which ruling of the Court the defendants by their attorneys, except.

DEFENDANTS' COUNTER PRAECIPE.

(Filed June 27, 1935.)

[Case No. 4045.]

To the Clerk of the Above-entitled Court:

In addition to the items called for in the Praecipe filed by plaintiff in the above-entitled case, you will please incorporate in the transcript of record for the Court of Appeals for the Sixth Circuit, the following:

A. Petition to supply the last eight pages missing from Plaintiff's Exhibit 13 and Order granting the same but allowing exceptions to defendant—dated June 18, 1935.

B. Letter of Wm. B. Woods, Special Master, dated December 30, 1933, and addressed to counsel for the respective parties.

C. Letter dated January 13, 1934, addressed to Wm. B. Woods, Special Master and signed F. O. Richey and Wm. C. McCoy.

D. Defendants' Motion for leave to add to the record in the above entitled cause the defendants' Counter Praecipe and certain letters and Order denying the same.

JOHN H. BRUNINGA,
Attorney for Defendants.

St. Louis, Mo.
June 19, 1935.

ORDER SETTLING CONTENTS OF RECORD.

(Entered July 6, 1935 by Paul Jones, Judge.)

[Case No. 4045.]

On objection of Plaintiffs to items B and C of Defendants' counter praecipe filed June 27, 1935, it is ordered that items B and C of Defendants' counter praecipe filed June 27, 1935, be omitted from the transcript of record. Exception to Defendants.

On objection of Plaintiffs to item D of Defendants' counter praecipe filed June 27, 1935, it is ordered that the transcript of record shall contain item D of Defendants' counter praecipe filed June 27, 1935. Exception to Plaintiffs.

It is further ordered that the transcript of record shall contain item A of Defendants' counter praecipe filed June 27, 1935 and the following additional papers:

Defendants' counter praecipe filed June 27, 1935.
This order.

JONES,
U. S. District Judge.

Approved:

EVANS & McCOY,
Attorneys for Plaintiffs.

KWIS, HUDSON & KENT,
Attorneys for Defendants.

ORDER FOR WITHDRAWAL OF EXHIBITS.

(Entered September 4, 1935 by Paul Jones, Judge.)

[Case No. 4045.]

It having been represented to the Court by the parties herein that plaintiffs' Exhibits 1, 1Z, 2Z, 2A, 2B, 3A, 3B, 3C, 3D, 4A, 4B, 4C, 4D, 5A, 5B, 5C, 5D, 8, 9, 10-A, 12, 14, 17, 20, 23, 24, 30, 34, 42A, 42B, 42C, 43, 47, 48, 49, 58, 59, 61, 71-A, 71-B, 72-A, 72-B, 73, 76, 79, 80, 81, 82, 83, and

Defendants' Exhibits A, B, E, F, G, O, P, P-1, P-2, Q, R, V_1 to V_7 inclusive, W, X, Y, AA, GG-1, HH-1, II-1, II-2, JJ-1, NN, AAA, BBB, CCC, EEE, FFF, 3-G, 3-H, 3-I, 3-J, 3-K, 3-L, 3-M, 3-N, 3-O, 3-P, 3-Q, 3-R, 3-T, 3-V, 3-W, 4-R, 5-F_1 to 5-F_{12} inclusive, 5-G, 5-H_1, 5-H_2, 5-H_3, 5-I, 5-K_{10}, 5-L, filed in this cause, are physical exhibits or otherwise cannot be conveniently duplicated or are needed for inspection as physical exhibits in the United States Court of Appeals for the Sixth Circuit, it is hereby ORDERED that the said Exhibits be withdrawn from the

files of this Court and transmitted under the supervision of the Clerk of this Court to the Clerk of the United States Court of Appeals for the Sixth Circuit at Cincinnati, Ohio, and the Clerk of this Court is hereby directed to withdraw the same from the files and supervise the packing and transmitting thereof to the Court of Appeals.

JONES,
United States District Judge.

Consented to:

WM. C. McCOY,
Counsel for Plaintiffs.

JOHN H. BRUNINGA,
Counsel for Defendants.

STIPULATION RE CERTIFICATION OF RECORD.

(Filed May 6, 1935.)

[Case No. 4045.]

In accordance with Section 6 of Rule 44 of the general rules of this Court, it is hereby agreed that the record as presented to the Clerk by the printer, may be certified by the Clerk as required by law and the rules of the Appellate Court, as a true, full and complete copy of the original pleadings, papers and orders used on the trial of this cause, as set forth in the precipe for transcript, without further comparison by the Clerk.

Exception Nos. 56, 57 and 58 1219
Exception Nos. 59, 60 and 61 1220
Exception No. 62 and Nos. 63 to 97 Inclusive 1221
Exception Nos. 98, 99, 100 and 101 1225
Exception Nos. 102, 103 and 104 1226
Exception Nos. 105, 106, 107 and 108 1227
Exception Nos. 109, 110 and 111 1228
Memorandum on Exceptions to Master's Report 1229
Final Decree 1230
Petition for Appeal 1231
Order Allowing Appeal 1231
Assignment of Errors 1232
Group A—Assignment of Errors relating to Validity of the Gulick Patent No. 1,815,733 1232
Group B—Assignment of Errors relating to Infringement of the Gulick Patent in Suit 1240
Group C—Assignment of Errors relating to Validity of the Jardine Patent No. 1,763,523 1241

Group D—Assignment of Errors relating to Infringement of Jardine Patent in Suit..... 1242

Group E—Assignment of Errors relating to Validity of Maynard Patent No. 1,655,968..... 1243

Group F—Assignment of Errors relating to Infringement of Maynard Patent in Suit..... 1245

Group G—Assignment of Errors relating to Validity of Mooers Patent No. 1,402,309..... 1246

Group H—Assignment of Errors relating to Infringement of Mooers Patent in Suit..... 1248

Group I—Assignment of Errors relating to Validity of Schmiedeknecht Patent No. 1,256,265..... 1248

Group J—Assignment of Errors relating to Infringement of the Schmiedeknecht Patent in Suit..... 1249

Group K—General Assignment of Errors..... 1250

Citation 1251

Bond on Appeal..... 1253

Order Granting Stipulation for Filing Narrative Form Testimony in One Cause with Reference Thereto in Each of Other Two Causes..... 1255

Order Extending Time to Nov. 24, 1934 for Lodging Narrative Statement of Evidence and Filing Praecipe and to Dec. 16, 1934 for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1255

Order Extending Time to Dec. 14, 1934 for Lodging Narrative Statement of Evidence and Filing Praecipe and to Dec. 26, 1934 for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1256

Stipulation Extending Time to Dec. 21, 1934, for Filing Praecipe and Lodging Narrative Statement of Evidence 1257

Order Granting Stipulation Extending Time to Dec. 21, 1934 for Filing Praecipe and Lodging Narrative Statement of Evidence 1257

Order Extending Time to Dec. 31, 1934 for Lodging Narrative Form of Testimony and Filing Praecipe and to Jan. 25, 1935, for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1258

Order Extending Time to Jan. 14, 1935 for Lodging Narrative Form of Testimony and Filing Praecipe..... 1258

Order Extending Time to Jan. 28, 1935 for Lodging Narrative Form of Testimony and Filing Praecipe and to Feb. 23, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals 1259

Order Extending Time to Feb. 18, 1935 for Lodging the Narrative Form of Testimony and Filing Praecipe 1260

Order Extending Time to Feb. 25, 1935 for Lodging Narrative Form of Testimony and Filing Praecipe and to March 25, 1935, for Filing Transcript of Record in U. S. Circuit Court of Appeals 1261

Order Extending Time to March 15, 1935 for Filing Praecipe 1261

Order Extending Time to April 15, 1935 for Filing Praecipe and to April 25, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals 1262

Order Extending Time to May 6, 1935 for Filing Praecipe and to May 16, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals 1263

Order Extending Time to June 15, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals 1263

Order Extending Time to August 15, 1935 for Filing Transcript of Record in United States Circuit Court of Appeals 1264

Order Extending Time to August 31, 1935 for Filing Transcript of Record in United States Circuit Court of Appeals 1265

Order Extending Time to Sept. 30, 1935 for Filing Transcript of Record in United States Circuit Court of Appeals 1265

Stipulation that Appeals in Causes Nos. 4045, 4046 and 4047 be Consolidated in One Printed Transcript of Record, That Exhibits Used Therein may be Used in Each of Said Causes and That Repetition of Similar Pleadings in Each be Eliminated 1266

Order Consolidating Appeals in One Printed Transcript of Record, That Exhibits Used Therein may be Used in Each of Said Causes, and Further Ordering Elimination of Repetition of Similar Pleadings in Each Cause 1267

Stipulation Re Digest of Exhibits 1267

Order Granting Stipulation Re Digest of Exhibits 1268

Praecipe 1269
Defendants' Motion for Leave to Add to the Record in the Above-Entitled Case Defendants' Counter Praecipe and Certain Letters 1273
Order Denying Motion of Defendants for Leave to Add to Record Defendants' Counter Praecipe and Certain Letters 1277
Petition to Supply Last Eight Pages Missing from Plaintiffs' Exhibit 13 in the Above Cause on Appeal 1278
Order Granting Leave to Supply Last Eight Pages of Plaintiffs' Exhibit No. 13 1278
Defendants' Counter Praecipe 1279
Order Settling Contents of Record 1279
Order for Withdrawal of Exhibits 1280
Stipulation Re Certification of Record 1281

VOLUME III

PLAINTIFFS' EXHIBITS.

(*W* in last column signifies *Withdrawn or Omitted*)

Nos.		Offered Vol. I	Printed Vol. III
1.	Piston Manufactured by Sterling Products Corporation and referred to in Answer	51	W
2.	U. S. Patent No. 1,815,733, July 21, 1931, to E. J. Gulick (Patent in Suit).....	51	1283
3.	U. S. Patent No. 1,763,523, June 10, 1930, to F. Jardine (Patent in Suit).....	51	1291
4.	U. S. Patent No. 1,655,968, Jan. 10, 1928, to H. E. Maynard (Patent in Suit)	51	1299
5.	U. S. Patent No. 1,256,265, Feb. 12, 1918, to V. E. Schmiedeknecht (Patent in Suit)	51	1305
6.	U. S. Patent No. 1,402,309, Jan. 3, 1922, to L. P. Mooers (Patent in Suit).....	51	1309

Stipulated Digest of Assignments of Patents in Suit (Offering of Assignments omitted from Narrative):

Gulick Patent No. 1,815,733

2-A.	Edward J. Gulick to Packard Motor Car Co.	51	1321

Nos.		Offered Vol. I	Printed Vol. III
2-B.	Packard Motor Car Co. to The Cleveland Trust Co.	51	1321
	Jardine Patent No. 1,763,523		
3-A.	Frank Jardine to The Aluminum Castings Co.	51	1321
3-B.	The Aluminum Castings Co. to Aluminum Manufactures, Inc.	51	1321
3-C.	Aluminum Manufactures, Inc. to Aluminum Co. of America	51	1321
3-D.	Aluminum Co. of America to The Cleveland Trust Co.	51	1322
	Maynard Patent No. 1,655,968		
4-A.	Howard E. Maynard to Chrysler Corporation	51	1322
4-B.	Chrysler Corporation to Aluminum Manufactures, Inc.	51	1322
4-C.	Aluminum Manufactures, Inc. to Aluminum Co. of America	51	1322
4-D.	Aluminum Co. of America to The Cleveland Trust Company	51	1322
	Schmiedeknecht Patent No. 1,256,265		
5-A.	Victor E. Schmiedeknecht to Frank J. Kent	51	1323
5-B	Warranty and Guaranty by Victor E. Schmiedeknecht	51	1323
5-C.	Frank J. Kent to Bohn Aluminum and Brass Corp.	51	1323
5-D.	Bohn Aluminum & Brass Corp. to The Cleveland Trust Co.	51	1323
7.	Instruction Sheet to Purchasers of Exhibit No. 1	52	1325
8.	Ray Day Piston	53	W

Nos.		Offered Vol. I	Printed Vol. III
9.	Ray Day Piston	53	W
10.	Letter, March 19, 1932 to American Gear Co. from Aberdeen Motor Supply Co. (Formal Offer not included in Narrative)	...	W
10A.	Advertisement (Discussed, 53)	...	W
11.	Circular Letter of Sterling Products Corporation (Formal Offer not included in Narrative)	...	1327
12.	Poster displayed by Defendants	53	W
13.	Tabulation as to Sales Produced by Whitney	57	1328
14.	Large Drawing of Internal Combustion Engine	61	W
15.	Drawing of Cross Section of Cylinder and Piston Wall	67	1333
16.	Drawing of Cross Section of Cylinder and Piston Wall (Magnified)	67	1335
17.	Piston Manufactured by Plaintiff's Licensees and duplicated by Sterling Products Corp.	80	W
18.	Letter, March 24, 1932, in Reply to Exhibit No. 10 (Formal Offer not included in Narrative)	...	W
19.	Letter of Mr. Bruninga to F. E. Rowe (Formal Offer not included in Narrative)	...	W
20.	Gulick Piston	156	W
21.	Blueprint D-2376X of Defendants' 3-N Exhibit	190	1337

* In the case of Exhibits which were formally offered on pages of the Original Transcript not included in the Narrative, reference to them is made by the use of the words as "Discussed," "Identified" or "Marked for Identification" in parenthetical brackets instead of by the use of figures in the "Offered" Column of this Index.

Nos.		Offered Vol. I	Printed Vol. III
22.	Blueprint D-2460X, of Defendants' 3-M Exhibit	190	1339
23.	Large Drawing of Ray Day Pistons	190	W
24.	Double-Walled Aluminum Piston	258	W
25.	Consent Decree, Simmons Case	264	1341
26.	Conveyance, Declaration of Trust and Agreement between L. P. Mooers and George B. Pitts and The Cleveland Trust Co., dated March 7, 1922	265	1345
27.	Copy of Letter, Jan. 23, 1933, The Cleveland Trust Co. to Chrysler Corporation (Formal Offer not included in Narrative)	...	W
		Offered Vol. II	Printed Vol. III
28.	Bill of Sale, Amplex to Gulick	608, 617	1358
29.	Sketch by Randall of Gulick Piston	617	1359
30.	Series of Blueprints of Gulick Motor	617	W
31.	Cross Section Drawing Gulick Sleeve Valve Motor	617	1361
32.	Detail of Piston of Preceding Exhibit	617	1363
33.	Sketch, Gulick Piston (P.X. 62)	770	W
34.	Ebbs Physical Piston (Marked for identification, 565)	...	W
35-A.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1365
35-B.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1367
35-C.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1369
35-D.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1371
35-E.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1373
36.	Gulick 1911 Sketch (Identified, 701)	730	1375
37.	Gulick Written Description (Identified, 702)	730	1377

Nos.		Offered Vol. I	Printed Vol. III
38a.	Supplemental Contract between The Cleveland Trust Co. and Aluminum Co. of America, dated April 26, 1924.....	282	1378
38b.	License Agreement between The Cleveland Trust Co. and Aluminum Co. of America	282	1381
	Exhibit A to License Agreement (Agreement between The Cleveland Trust Co. and Nordyke & Marmon Co., dated April 23, 1920).....	282	1393
38c.	License Agreement between Walker M. Levett Co., W. M. Levett Corp., Walker M. Levett and The Cleveland Trust Co., dated April 11, 1924.....	282	1397
38d.	License Agreement between The National Piston Co., Gustave E. Franquist, James E. Diamond and The Cleveland Trust Co., dated April 11, 1924.....	282	1403
38e.	License Agreement between Kant-Skore Piston Co. and The Cleveland Trust Co., dated April 11, 1924.....	282	1408
39a.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Sept. 19, 1927	282	1412
39b.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Oct. 12, 1927	283	1413
39c.	License Agreement between The Cleveland Trust Co. and Bohn Aluminum & Brass Corp., dated Sept. 15, 1927, with Lists A and B attached.....	283	1414
	List A	283	1426
	List B	283	1427
39d.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Sept. 19, 1927	283	1428

Nos.		Offered Vol. I	Printed Vol. III
39e.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated April 26, 1928	283	1429
39f.	License Agreement between The Cleveland Trust Co. and Bohn Aluminum & Brass Corp., dated April 25, 1928	283	1430
39g.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Dec. 24, 1929	283	1434
40.	Agreement between Bohn Aluminum & Brass Corporation and The Cleveland Trust Co., dated Oct. 12, 1927 under Schmiedeknecht Patent No. 1,256,265	287	1435
		Offered Vol. II	Printed Vol. III
42a.	Franklin Weekly Engineering Report for the Week Ending Oct. 5, 1918	658, 663	1438
42b.	Franklin Weekly Engineering Report for the Week Ending July 20, 1918	658, 663	1439
42c.	Franklin Weekly Engineering Report for the Week Ending May 3, 1919	658, 663	1440
43.	Photostat of Drawing P-2912	663	W
44.	Letter to E. C. Long from Franklin Mfg. Co., dated May 9, 1918	663	1445
45.	Letter to E. C. Long from Franklin Automobile Co., dated April 17, 1918	663	1446
44.*	Gulick Sketch Made in Court of First Sketch of 1911 (Identified, 701)	730	1447
45.*	Blueprint of Standard Excelsior Motor (Identified, 704)	730	1449
46.	Blueprint P-2912	693	1451
47.	Piston Used by Excelsior Motor (Identified, 705)	730	W
48.	Reproduction of Piston as Used by Excelsior (Identified, 705)	730	W
49.	Excelsior Motorcycle Piston (Identified, 709)	730	W

Nos.		Offered Vol. II	Printed Vol. III
50.	Blueprint of Excelsior Motorcycle Piston (Identified, 709)	730	1453
51.	Gulick Sketch Made in Court of Piston made by Casting of Rockhoff	716	1455
52.	Letter, Packard Motor Car Co. to E. J. Gulick, dated Mar. 27, 1916	721	1457
53.	Letter, E. J. Gulick to Packard Motor Car Co., dated April 1, 1916	722	1459
54.	Letter, E. J. Gulick to Packard Motor Car Co., dated Dec. 4, 1916	722	1460
55.	Letter, Packard Motor Car Co. to E. J. Gulick, dated Feb. 28, 1917	722	1461
56.	Letter, E. J. Gulick to Packard Motor Car Co., dated May 18, 1917	722	1462
57.	Letter, E. J. Gulick to Packard Motor Car Co., dated Mar. 26, 1917	724	1463
58.	Core-box Used by Excelsior Motor & Mfg. Co.	724	W
59.	Pattern Used by Excelsior Motor & Mfg. Co.	724	W
60.	Picture of Renault Type Car Driven by Gulick in 1911	727	1465
61.	Letter in re Above, dated Dec. 1, 1927, in re Loss of Original	727	W
62.	Gulick Exhibit No. 11 in Interferences 49,569, 49,570 and 49,571	770	1467
63.	Letter, Ray Stewart Gehr to E. J. Gulick, dated Aug. 22, 1923 (Identified, 811)	...	1469
64.	Letter, E. J. Gulick to Ray Stewart Gehr, dated Aug. 23, 1923 (Identified, 811)	...	1471
65.	Gulick Deposition on Interferences 49,569, 49,570 and 49,571, pages 40 to 103, inclusive	827	1472
	Index of Exhibits showing both Interference and Transcript Numbers of Exhibits		1472

Nos.		Offered Vol. II	Printed Vol. III
	Edward J. Gulick:		
	Direct Examination		1475
	Cross Examination		1501
	Re-Direct Examination		1518
	Re-Cross Examination		1526
	Re-Direct Examination		1530
	Re-Cross Examination		1531
66.	Patent Office List of Applications of Elmer C. Long filed in Patent Office	830	1532
67.	Record of Long Interference No. 45,569	831	W
67-A.	Record of Interference of Exhibit No. 65 (pp. 104 to 281) not received	831	W
67-B.	Opinion of Examiner in Interference No. 49,569	832	1533
67-C.	Opinion of Board in Interference No. 49,569	832	1538
67D.	Opinion of the Court of Patent Appeals	832	W
68.	Record of Interference No. 49,575	...	W
68-A.	Opinion of Examiner in Interference No. 49,575	832	1541
68-B.	Opinion of Board in No. 49,575	832	1544
68-C.	Opinion of Court of Appeals of District of Columbia in Interference No. 49,575.	832	1546
69.	Record of Interference No. 49,570	...	W

69-A(2).	Opinion of Examiner of Interferences in Interference No. 49,570	832	1551
69-B(1).	Petition for Rehearing in Interference No. 49,570	832	1554
69-B(2).	Opinion of Board in Interference No. 49,570	832	1556
69-B(3).	Opinion of the Board of Appeals in Interference No. 49,570	832	1558

Nos.		Offered Vol. II	Printed Vol. III
69-C.	Opinion of the Court of Customs and Patent Appeals in Interference No. 49,570	832	1562
70-A.	Opinion of the Examiner in Interference No. 49,571	832	1565
70-B.	Opinion of the Board in Interference No. 49,571	832	1570
71-A.	Head Portion of Piston of Franquist Type	944	W
71-B.	Skirt Portion of Piston of Franquist Type	944	W
72-A.	Head Portion of Piston of Maynard Type	945	W
72-B.	Skirt Portion of Piston of Maynard Type	945	W
73.	Ricardo Type Piston	951	W
74.	Drawing Showing Dimensions of Defendants' Exhibit Monckmeier 3-V	952	1573
75.	Drawing Showing Dimensions of Defendants' Exhibit Monckmeier 3-W	952	1575
76.	Ford 1933 Piston	1048	W
77.	Agreement, Aug. 4, 1917, between Mooers-Pitts, Cleveland Trust-Sawyer, Sterling-Alexander (Formal Offer not included in Narrative)	...	W
78.	Ditto of March 7, 1922 (Formal Offer not included in Narrative)	...	W
79.	Drawing of Iron Piston Used by Dorris Motor	1082	W
80.	Sterling Piston with Steel Strut	1088	W
81.	Docket Entry, Gulick vs. Packard Motor Car Co.	1090	W
82.	Amplex Receivership Statement of Feb. 6, 1914	1090	W
83.	Amplex Receivership Journal Entry	1090	W
84.	Ruling of Examiner in Abandoned Application of Ray E. Day for Patent	1091	1577

Nos.		Offered Vol. II	Printed Vol. III
85.	Certified Copy of the Drawings of the Abandoned Application of Ray E. Day, filed January 10, 1923, Serial No. 611,698	1091	1579
86.	Patent Office Interference	...	W

DEFENDANTS' EXHIBITS.

(*W* in last column signifies *Withdrawn or Omitted*)

Nos.		Offered Vol. I	Printed Vol. III
A.	Drawing produced by Venner of Long 1916 Piston	352	1585
B.	Piston Used by Franklin	352	W
C.	Two Paragraphs from Service Department Bulletin, Sheet No. 262, April 8, 1920, of Franklin Automobile Co., entitled "Long Type Pistons"	352	1587
D.	Seven paragraphs from Service Department Bulletin, Sheet No. 289, Nov. 11, 1920, of Franklin Automobile Co., entitled "New Design for Series Nine" ...	352	1588
E.	Piston Purchased from M. K. Weems ..	352	W
F.	Long 1916 Type Piston	352	W
G.	Piston Purchased from Franklin Factory	352	W
H.	Article from Franklin Service Bulletin No. 348, April 18, 1932, of Franklin Automobile Co., entitled "The Oval Type Piston"	352	1589
I.	Article from Page 1, Franklin Service Bulletin No. 369, Feb. 20, 1923, of Franklin Automobile Company, entitled "Piston and Wrist Pin Knocks," and Drawing on page 2, entitled "Drill Jig for Extra Oil Holes in Piston"	352	1591
J.	Forfeited and Abandoned Application of William M. Venner for Improvement in Pistons, filed April 12, 1920, Serial No. 373,340	354	1595

Nos.		Offered Vol. I	Printed Vol. III
K.	Venner Drawing, Feb. 16, 1920	354	1603
L.	Letter from George J. Oltsch to Wm. M. Venner, dated Sept. 22, 1920	354	1605
M.	Photostat of page 149, showing Cut only in "The Gasoline Automobile," by Heldt, Vol. I	368	1607
N.	Article from Pages 8 and 9 of Manual for Trouble Shooters of Franklin Automobile Company, entitled "Piston Slap"	372	1609
O.	Drawing produced by Chadwick, Long 6-Slot Piston	392	1611
P(1 & 2).	Core Box	392	W
Q.	Core Box	392	W
R.	Small Piston of Type made for Oldsmobile Car or Northway Motor	392	W
S.	Tracing of "Oldsmobile Six" Piston produced by Chadwick	392	1613
T-1.	Tracing produced by Chadwick of Long Pistons for Ford, Model T Car	392	1615
T-2.	Tracing produced by Chadwick of Long Pistons for Essex Car	392	1617
T-3.	Tracing produced by Chadwick of Long Pistons for Duesenberg Car	392	1619
U.	Weems' Advertisement on Page 124 of "Motor Age" for July 7, 1921	392	1621
V, V-1 to V-7.	Books of the Weems Company (Marked for Identification, 385)	...	W
W.	Photostat of Trunk Piston added to by Chadwick to show T-Slot, Long Piston	396	1623
X.	Digest of Defendants' Exhibit X, Agreement dated Sept. 20, 1919 between E. C. Long and M. K. Weems	407	1625
Y.	Photostat of Drawing by Stellman, Long 1916 Piston (Identified, 452)	...	1627
Z.	L. M. Stellman's Report, dated March 18, 1919, entitled "Test on Long Pistons"	453	1629

Nos.		Offered Vol. I	Printed Vol. III
AA.	Digest of Defendants' Exhibit AA, License Agreement dated March 20, 1919, between E. C. Long and Franklin Mfg. Co.	454	1632
CC'(1).	Blueprint D-793X of The Aluminum Castings Co. (Drawing of proposed design of piston for H. H. Franklin Mfg. Co.)	466	1633
CC'(2).	Blueprint D-944X of The Aluminum Castings Co. (Drawing of proposed design of piston for H. H. Franklin Mfg. Co.)	466	1634
CC'(3).	Blueprint D-960X of The Aluminum Castings Co. (Drawing of proposed design of piston for H. H. Franklin Mfg. Co.)	466	1635
DD.	Sketch of Long Piston seen by Royalty in 1913	435	1637
EE.	Sketch of Long Piston by Royalty in February, 1918	437	1638
FF.	Sketch of other views of piston shown in Exhibit EE	438	1639
GG.	Photostat of Pattern Record Card marked D-8764	413	1640
HH.	Photostat of Pattern Record Card marked A-640	414	1641
II.	Photostat of Pattern Record Card marked B-122	414	1642
JJ.	Photostat of Pattern Record Card marked H-4	415	1643
KK.	Photostat of Pattern Record Card marked C-123	415	1644
LL.	Card bearing notation, "Use Patt. A-640 as per instructions on core box"	415	1645
MM.	Card bearing designation, "Patt. No. A-641"	422	1646
NN.	Casting	427	W

Nos.		Offered Vol. I	Printed Vol. III
AAA.	Strut Type Piston (Offered as Plaintiff's Exhibit No. 41)	591	W
BBB.	Piston, Six Cylinder Chevrolet	55	W
CCC.	Piston, Four Cylinder Chevrolet	590	W
DDD.	(No Exhibit)	...	....
EEE.	Cut-in-half Piston like Spillman and Mooers	590	W
FFF.	Piston made in Permanent Mold	590	W

UNITED STATES PATENT OFFICE

EDWARD J. GULICK, OF WHEELER, INDIANA, ASSIGNOR, BY MESNE ASSIGNMENTS, TO THE OLMSTEAD MOTOR COMPANY, A CORPORATION OF OHIO

PISTON

Application filed December 18, 1922. Serial No. 607,431.

This invention relates to pistons.

One of the objects of the present invention is to provide a piston which will not expand against the cylinder wall to such an extent as to seize or stick.

Another object of the invention is to provide a piston with a skirt or guide portion slightly separated from the body of the piston and split longitudinally so that it will not expand in circumference with a force great enough to cause the piston to stick in the cylinder.

Another object of the invention is to provide a piston with improved packing means for the piston pin bosses.

Another object of the invention is to support the piston pin bosses of a piston from the piston wall without individual bolts thereto from the connecting rod without interfering with the guiding characteristics of the skirt in response to cylinder wall pressure.

Other objects of the invention will appear from the following description, taken in connection with the accompanying drawings, forming a part of this specification, and in which:

Fig. 1 is a longitudinal sectional view through a piston embodying the invention;

Fig. 2 is similar to Fig. 1, but on a right angle thereto, being on the line 2—2 of Fig. 3;

Fig. 3 is a transverse section substantially on the line 3—3 of Fig. 1;

Fig. 4 is a transverse section on the line 4—4 of Fig. 1;

Fig. 5 is a view similar to Fig. 1, showing a slightly different form of piston embodying the invention; and

Fig. 6 is a top view of the piston shown in Fig. 5.

Referring to the drawings, 10 designates the head portion of a piston and 11 is a skirt or guide portion which is spaced at a distance from the head portion to provide an annular slot or opening 12 therebetween. The head portion of the piston is provided with an annular groove 13 which receives a piston ring 14, and the upper end of the skirt portion 11 is formed with a similar groove 15 for the reception of an annular piston ring 16. The skirt portion 11 is split longitudinally as at 17 and is provided with a plurality of openings 18 which communicate with the annular groove 15 and with the slot 12 for the purpose of collecting the oil that may be scraped from the cylinder during the reciprocation of the piston.

The piston is also provided with a pair of spaced bosses, pin bores 19 which are formed with integral supporting flanges 20 extending around the bores and terminating in the inner wall of the skirt portion 11. These flanges 20 are preferably of the same thickness as the wall of the skirt portion 11 and in the form of webs 21 which integrally connect the bosses 19 with the wall of the guide portion 11 as shown in the drawings. Since there are two of these webs extending from the wall of the bosses 19 there are therefore four openings 22 between the webs 21 in the skirt or guide portion 11. These openings are in the form of segments of circles as shown.

The flanges 20 are connected together by the bosses 19 by the webs 21 and by the wall of the skirt portion 11 and thereby eliminate the necessity of the bolts and fastening elements by which the bosses are usually connected to the connecting rod. The bosses are connected with the head portion of the piston by the webs 21 which are integral with the head portion and the bosses 19 and are shown in Fig. 1 as being of substantially the same thickness as the flanges 20 and the skirt portion 11.

In order that the oil may be scraped from the cylinder wall by the piston it is necessary that the piston be provided with a plurality of openings through which the oil may pass. In the present instance the openings 18 are provided for this purpose and are shown as being in the form of slots which are arranged in pairs, one pair being disposed between each pair of bosses as shown in Figs. 1 and 6.

In order that the oil may be returned to the crank case through the piston it is necessary that the piston be provided with openings through which the oil may pass. In the present instance the openings 22 are provided for this purpose and are shown as being in the form of segments of circles as shown in Figs. 1 and 6.

may be inserted. As these openings are well above the bottom of the guide portion of the piston the lower end of the piston skirt is left unbroken, except for the split 21, and the arcuate parts of the skirt beneath said openings may be looked upon as joining the lower ends of the diametrically opposite cylinder-engaging parts of the guide that sustain the angular thrust of the connecting rod.

It will be seen that in addition to providing a piston with a split guide portion, the above described construction also provides a longitudinally rigid connection between the piston pin bosses and the guide portion of the piston, which construction may be used either with or without the split guide portion and separated head. The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with both the piston guide portion and the head provide a particularly strong construction, and at the same time, when the longitudinal split is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston.

In Figs. 5 and 6 the webs or walls 18 are slightly curved between the flanges 17 and the guide portion to thereby distribute the connection of the bosses to the guide portion more evenly around the piston. Otherwise the showing is substantially the same as in the other figures. While my piston is, of course, adapted for use in either vertical, inclined, or horizontal engines, for convenience I refer in some instances to its head end and its open end as the upper and lower ends or parts, respectively.

It will be understood further that my invention is not limited to the details of construction shown and other forms may be used without departing from the spirit or scope of the invention.

Having thus described my invention, what I claim and desire to secure by Letters Patent is:—

1. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connection to said bosses.

2. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses integrally connected to the head and to the upper and lower part of the skirt, the outer ends of the pin bosses being spaced from the opposing parts of the skirt wall and said skirt having openings opposite the open ends of the bosses, said skirt being split longitudinally at one side between its connections to said bosses.

3. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses integrally connected to the head and to the skirt in four longitudinal lines, the ends of said bosses being spaced from the opposing parts of the wall of the skirt, said skirt having openings therethrough opposite the open ends of the bosses.

4. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head, and also connected to the skirt both above and below the bosses, said skirt being split longitudinally between its connections to said bosses.

5. An integrally cast piston comprising a head, a skirt separated at its periphery from the head, and pin bosses integrally connected to the head and to the skirt at both sides and in the zone of said bosses, the bosses having their ends spaced from the opposing parts of the skirt wall, said skirt being split longitudinally between its connections to said bosses.

6. An integrally cast piston comprising a head, a skirt, separated piston pin bosses within the skirt, and an integral flange on each of said bosses intermediate its ends, said flange extending from both sides of the boss to the piston skirt and integrally united therewith in the zone of the boss, said flanges being yieldable in the direction of the piston pin boss axis and relatively rigid in the direction of their length.

7. A piston comprising a head, a skirt, separated piston pin bosses integral with the head and disposed within the skirt, and integral transversely flexible webs extending from the intermediate part of each of said bosses to the skirt wall in the zone of the boss for supporting the bosses from the adjacent part of the skirt.

8. A piston comprising a head, a skirt having its periphery separated from the head, pin bosses in the piston spaced from the wall of the skirt and conduits leading from the top of said skirt to the interior of said bosses.

9. A piston comprising a head, a skirt having its periphery separated from the head, pin bosses in the piston, the ends of said bosses being spaced from the walls of the skirt; means integrally connecting the bosses with the head and skirt, and ports leading from the upper part of the skirt to the bosses.

10. A piston comprising a head, a skirt, separated piston pin bosses within the skirt, and an intermediate flange on each of said bosses intermediate its ends, said flange extending laterally from both sides of the boss to the piston skirt in a curve and integrally united with the skirt in the zone of the boss.

11. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the

skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

12. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

13. A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

14. A piston for internal combustion engines comprising in combination a head portion having an end wall and a ring-packed side wall, a guide portion having an annular bearing surface at the open end thereof and diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall of the head portion by an unobstructed air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of longitudinally disposed walls connected to said bosses and each joined at relatively widely separated points to the said cylinder-engaging parts above and below the plane of the boss axis, said walls being disposed within the maximum diameter of the piston, and integral, rigid connections extending from the bosses to the head portion.

15. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

16. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap and one of said cylinder-engaging parts being split longitudinally from its upper edge to its lower edge, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, and walls integrally uniting said bosses, the guide portion and the head portion, said split in the cylinder-engaging face of said guide portion being disposed between the connections thereto of said walls.

17. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and arcuate cylinder-engaging parts joining said diametrically opposite parts at the lower end of the guide, the said diametrically opposite parts each being separated at its upper end from the side wall of the head section by an air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of transversely flexible walls integrally connected to said bosses and integrally joined to the cylinder-engaging parts at points above and below the plane of the boss axis, said walls being disposed within the maximum diameter of the piston, and connections extending from the bosses to the head portion and integral therewith.

18. A piston for an internal combustion engine cylinder comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to receive the side thrust of a connecting rod and arcuate cylinder-engaging parts joining said diametrically opposite parts at the lower end of the guide portion to provide an annular bearing face adjacent the open end of the piston, each of said diametrically opposite cylinder-engaging parts being separated at its upper end from the side wall of the head portion, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of spaced walls, each of which connects one of said bosses to said cylinder-engaging parts at points above and below the plane of the boss axis, one of said diametrically opposite cylinder-engaging parts being split longitudinally from its upper edge to its lower edge between the connections to said walls, and connections extending from the bosses to the head portion, whereby said piston, due to expansion of the parts during operation, is compressed to a smaller wall pressure.

19. A piston for internal

tion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of walls connected to said bosses and joined to the said cylinder-engaging parts at points above and below the plane of the boss axis, and rigid, integral connections between the bosses and the head portion comprising upward extensions of said walls with strengthening ribs disposed substantially at right angles thereto.

20. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, spaced supporting connections between said head and guide portions, one of said cylinder-engaging parts being split longitudinally from its upper edge to its lower edge between said supporting connections, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of walls disposed within the maximum diameter of the piston and integrally connected to said bosses and to said cylinder-engaging parts and to said head portion.

21. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said wall by an air gap and one of said cylinder-engaging parts being split longitudinally from its upper edge to its lower edge, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, and walls integrally uniting said bosses, the guide portion and the head portion, the guide structure and said walls being adapted to permit the split of the cylinder-engaging part to close more or less under the action of forces incident to the heating of the piston during operation.

22. A piston comprising in combination a head portion having an end wall and side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of walls connected to said bosses and joined to the said cylinder-engaging parts at points above and below the plane of the boss axis, and rigid, integral connections between the bosses and the head portion comprising upward extensions of said walls, one of the said cylinder-engaging parts being split longitudinally between the points of attachment thereto of the said walls.

23. In a piston, the combination of a head portion having an end wall and a side wall, a guide portion, a pair of separated piston pin bosses connected to the head portion, said webs disposed longitudinally of the piston integrally joining the inner parts of said bosses to the guide portion in the zone of said bosses.

24. A piston for internal combustion engines comprising a head portion, a guide portion, a pair of separated pin bosses connected to the head portion and arranged within the maximum diameter of the piston whereby the outer ends of the bosses will be out of contact with the cylinder wall, and a flange on each of said bosses near its inner end extending laterally from both sides of the boss to the guide portion in a curve and integrally united with the guide portion in the zone of the boss, said flanges being disposed longitudinally of the piston.

25. An integrally formed piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a pair of separated pin bosses, and a guide portion connected to said bosses and having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall of the head portion by an air gap and being split longitudinally between its connections to said bosses to accommodate expansion incident to the heating of the piston.

26. An integrally formed piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, spaced supporting connections between said head and guide portions, one of said cylinder-engaging parts being split longitudinally between the supporting connections from its upper edge to its lower edge, and a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts.

27. A one-piece piston with a solid crown portion and a skirt portion separated therefrom by spaced integral connections [illegible] having formed in its peripheral face a groove [illegible] and a circular [illegible] and in the [illegible] between the spaced integral connections [illegible] and of the piston, and [illegible] disposed [illegible] piston [illegible]

tions in the skirt which are capable of unrestrained outward and inward movement, the bearing faces of said piston diametrically opposite said longitudinal slot being circumferentially continuous between the spaced integral connections of the skirt to the head on that side of the skirt.

28. A one piece piston provided with a solid head portion and a skirt portion having oppositely disposed thrust bearing faces, said skirt portion having a longitudinally extending slot formed through the thickness of its wall, said slot extending from the rear edge of the skirt portion through one of said thrust bearing faces and forming adjacent disconnected parts of a thrust bearing face in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

29. A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

30. A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion separating from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

31. A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

32. A piston closed at one end and open at its opposite end, said piston having an annular cutting formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt which is approximately cylinder bearing in its entirety, a pair of wrist pin bearings depended from said piston end and said bearings free from engagement with said skirt, connecting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the thickness of its wall between its connections to said supporting means and extending from the open end thereof to said connecting means.

33. A piston for use in an engine cylinder comprising a head, a skirt, parts of said skirt forming oppositely positioned main bearing portions designed to take the side thrust of a connecting rod, a pair of spaced wrist pin bosses, means integrally connecting the bosses to the head, and means integrally connecting each boss to both of said opposite main bearing portions, one main bearing portion being circumferentially continuous between its connections to the bosses and the other main bearing portion being separated from the head and slit longitudinally between its connections to the bosses to render said slit main bearing portion yieldable in response to pressure from the engine cylinder during operation.

34. A piston for use in an engine cylinder comprising a head, a skirt, parts of said skirt forming oppositely positioned main bearing portions to take the side thrust of a connecting rod, a pair of spaced wrist pin bosses, means integrally connecting the bosses to the head, and means integrally connecting each boss to both of said opposite main bearing portions, one main bearing portion being circumferentially continuous between its connections to the bosses and the other main bearing portion being separated from the head and slit longitudinally its entire length between its connections to the bosses to render said slit main bearing portion yieldable in response to pressure from the engine cylinder during operation.

35. A single-piece, integral piston, comprising a head, a pair of spaced wrist pin bosses having a common axis, a skirt, and means yieldingly connecting the skirt to the head, said skirt being integral and having main cylinder bearing faces disposed on opposite sides of the axis of said wrist pin bosses, said skirt being separated from the head at the upper end of each of said bearing faces, one only of said main cylinder bearing faces being slit longitudinally between its connections to the head, whereby said head may expand and contract during operation of said piston substantially independently of said skirt portion when expansion of the skirt portion is restrained.

36. A single-piece, integrally cast piston for use in an engine, comprising a head, wrist pin bosses having a common axis, a skirt, and means connecting said head and bosses and skirt together, said skirt being integral and having a main bearing portion disposed on each side of the said wrist pin boss axis and designed to take the side thrust produced by the angularity of the connecting rod of the engine, said [illegible] slit through its wall on each side of the boss axis, portions of said skirt on the pressure and side of the piston skirt being slit longitudinally between its connections to said bosses to provide a peripheral [illegible] portion in the said [illegible] side of the

said piston that is capable of yielding in response to pressure from the engine cylinder during operation of the piston.

37. A single-piece, integral piston for operation in an internal combustion engine cylinder, comprising a head, spaced wrist pin bosses, a longitudinally slitted one piece skirt that is yieldable in response to cylinder wall pressure having cylinder-engaging faces disposed at opposite sides of the axis of said bosses and designed to yieldingly engage the walls of the cylinder during operation, said head and skirt being separated at the upper end of each of said cylinder-engaging faces, and means yieldingly connecting the skirt to said head including means connecting the bosses and the skirt, said means connecting said bosses and said skirt being substantially rigid in the direction transverse to the axis of the bosses, whereby said head portion may expand and contract during operation of said piston without binding engagement of the skirt with the walls of the cylinder.

38. A single-piece, integrally cast piston for use in an engine, comprising a head, wrist pin bosses having a common axis, a skirt, and means connecting said head and bosses and skirt together, said skirt being integral and having a main bearing portion disposed on each side of the said wrist pin boss axis and designed to take the side thrust produced by the angularity of the connecting rod of the engine, said piston having a transverse slit through its wall on both sides of the boss axis, one only of said main bearing portions being slit longitudinally between its connections to said bosses to provide a peripheral bearing portion therein that is capable of yielding outward and inward movement relative to the head during operation of the piston.

39. A piston for an engine cylinder comprising a skirt, a head separated from the skirt wall around its entire periphery, said skirt being longitudinally slit to render the skirt wall yieldable on every diameter in response to cylinder wall pressure, wrist pin bosses, and means rigidly connecting said bosses to the head and yieldingly connecting said bosses to the skirt whereby said skirt is yieldable in response to cylinder wall pressure.

40. A piston for an engine cylinder comprising a cylindrical skirt that is longitudinally slit and yieldable on every diameter in response to cylinder wall pressure, a pair of wrist pin bosses having a common axis, said skirt being integral and having a main cylinder bearing portion on each side of the axis of said wrist pin bosses, a head peripherally separated from at least one of said main cylinder-bearing portions, said means connecting the bosses with the skirt, said means being yieldable in the direction of the boss axis and substantially rigid in the direction transverse to said axis, whereby said head may freely expand and contract during operation of the piston when expansion of the skirt is restrained.

41. A piston comprising a head, a pair of spaced wrist pin bosses rigidly carried by the head and having a common axis, a skirt that is separated from the head on each side of the wrist pin bosses and longitudinally slit between the bosses on one side only of the bosses to render the skirt circumferentially yielding on that side of said bosses and circumferentially non-yielding on the opposite side of said bosses, and means substantially non-yielding in the direction transverse to the boss axis connecting the bosses with the skirt.

42. A piston for an engine cylinder comprising, a head, and an integral guide portion having diametrically opposite cylinder-engaging parts thereof designed to receive the thrust of a connecting rod during operation, one of said cylinder-engaging parts being rigidly connected to the head in the direction of load thrust from the connecting rod, the opposite cylinder-engaging part being yieldable relative to the head in response to cylinder wall pressure, whereby thermal expansion of said piston will not cause it to seize in the cylinder during operation.

43. A piston for an internal combustion engine cylinder, comprising a head portion carrying packing means and an integral guide portion integral with the head portion and having diametrically opposite cylinder-engaging parts thereof designed to receive side thrust from a connecting rod, one of said cylinder-engaging parts being slit longitudinally to render it materially more yielding than the opposite cylinder-engaging part.

In testimony whereof I affix my signature.

UNITED STATES PATENT OFFICE

FRANK JARDINE, OF CLEVELAND, OHIO, ASSIGNOR, BY MESNE ASSIGNMENTS, TO THE CLEVELAND TRUST COMPANY, AS TRUSTEE, OF CLEVELAND, OHIO, A CORPORATION OF OHIO

PISTON

Application filed March 11, 1926, Serial No. 94,257. Renewed March 3, 1931. Serial No. 520,202.

My invention relates to pistons for internal combustion engines and especially to pistons formed of light weight metals or alloys.

The invention has for its chief object the construction of a light alloy piston which, with relatively small initial clearance, will operate satisfactorily at all temperatures in an engine cylinder.

Another object of the invention is to produce a piston of the character noted that will lend itself to economic methods of manufacture.

Because of the high co-efficient of expansion of suitable light alloys such as aluminum alloys, as compared with iron, it is often difficult to fit an internal combustion engine satisfactorily operable with iron pistons, with light alloy pistons so that such pistons will not be noisy and will not pump oil when cold, or will not stick or score the cylinder wall when heated. I have found that these difficulties can be overcome by constructing a piston with its skirt or guide portion supported and slotted or divided in a manner to permit deformation and deflection of parts thereof without interfering with the performance of the essential functions of the respective parts.

To facilitate an understanding of the invention two forms or embodiments thereof are described hereinafter and are illustrated in the accompanying drawings in which

Fig. 1 is a view partly in side elevation and partly in section of a piston constructed in accordance with my invention.

Fig. 2 is a side elevation of the same piston viewed at right angles to Fig. 1.

Fig. 3 is a section on the line 3—3 of Fig. 1.

Fig. 4 is a section on the line 4—4 of Fig. 1.

Fig. 5 is a section on the line 5—5 of Fig. 1.

Fig. 6 is a view partly in side elevation and partly in section of a piston of modified form.

Fig. 7 is a side elevation of the same viewed at right angles to Fig. 6 and with parts broken away and shown in section.

Fig. 8 is a section on line 8—8 of Fig. 6.

Fig. 9 is a section on line 9—9 of Fig. 6.

Referring first to Figs. 1 to 5, the piston shown comprises a head portion 1 and a guide or skirt portion designated in its entirety by 2. The head portion consists of a head disc 3 and a peripheral flange 4 in which are grooves 4ª for the ordinary piston rings 5. On the lower face of the head disc 3 are formed two depending webs 6 integral with the disc. These webs carry bosses 7 which are adapted to receive the ordinary wrist pin. Ribs 8 may be provided along the webs 6 between the head disc and the bosses for strengthening the webs 6 and supporting the inner ends of the bosses. Additional ribs 9 may be formed on the outer sides of webs 6 as shown to strengthen them and to support the outer ends of the bosses.

The guide portion 2 comprises two pairs of guide segments 10 and 10ª curved to conform to the engine cylinder, one pair being located on either side of the bosses. The segments are integral with the webs 6 and are supported and connected to the head portion 1 by means of these webs. The segments at their upper ends are separated from the flange 4 of head portion 1 by slots 11 and are further isolated from the head by slots 11ª formed in webs 6. The segments of each pair are separated from one another by a longitudinally extending slot 12, said slot preferably being inclined or spirally arranged as shown. In the construction shown the guide portion formed by segments 10ª is designed to take the diagonal thrust of the piston rod during the compression stroke of the engine and as said thrust is less than the corresponding thrust during the explosion stroke, said portion 10ª is made narrower circumferentially than the other portion 10 so as to save weight.

The flange 4 of the head portion 1 has a smaller outer diameter than the guide portion 2, the diameter of the latter being only slightly smaller than the internal diameter of the cylinder in which it is to function.

In the operation of an internal combustion engine the piston usually is heated to a higher temperature than the cylinder wall and expands radially to a greater amount than the cylinder. This expansion reduces the clearance between the piston skirt or guide part and the cylinder wall and in the case of pistons not constructed according to

my invention, if the initial clearance provided is small, scoring of the cylinder walls or piston, or seizure of the piston in the cylinder may result. With my invention, however, the guide segments 10, 10ª, are capable of deformation or displacement as the piston guide parts expand, the segments being forced toward one another so as to tend to close up the slots 12. The webs 6 and guide segments preferably are so designed that this displacement of the segments 10, 10ª, is permitted by virtue of a bending of the webs 6 at points remote from the guide segments. To this end, as shown in Fig. 4, the thickness of the guide segments is increased toward the webs 6 and the webs 6 are decreased in thickness from the guide portions inward toward the bosses to points in line with the inner ends of the slots 11ª. This gives in effect a cantilever structure weakest at its support, namely, along the dotted lines 13 in Figs. 1 and 4. Thus the reaction force of the cylinder wall on the outer faces of the guide segments as the piston expands tends to cause bending of the webs 6 along said lines 13. Due to the bending of the web sections 6 and the forcing together of each pair of segments, the guide part of the piston may undergo a considerable thermal expansion without a corresponding increase in the outer diameter thereof and thus a small initial clearance can be used without danger of scoring or seizure of the piston.

By variation of the thickness and design of the webs 6 and the location of the slots 11ª therein, the force necessary to cause the guide segments 10 and 10ª to approach one another along the slot 12, or in effect to maintain the outer diameter of the piston substantially constant, can be easily regulated. The webs 6 will tend to bend along a line extending vertically downward from the ends of slots 11ª and if said slots are terminated closer to the guide segments 10, 10ª the region of bending will be moved outward correspondingly. Likewise a thickening of the webs 6 near the bosses will tend to move the point of bending or flexing closer to the guide segments 10, 10ª. An increase of the thickness of the webs 6 obviously will increase the force necessary to cause the guide segments 10, 10ª to approach one another along the slot 12.

In Figs. 6 to 9 a modified form of piston is shown. The head portion 21 is formed with a head disc 22 and a depending peripheral flange 23 in which may be formed grooves 24 for the ordinary piston rings. Depending webs 25 are formed at diametrically opposite parts of the lower edge of the peripheral flange 23. These webs carry bosses 26 for the customary wrist pin, the inner ends of the bosses being supported by ribs 27 which join the webs 25 and extend from the inner ends of the bosses 26 to the lower side of the head disc 22, while the outer ends of said bosses are supported by ribs 27ª.

On either side of the bosses 26 are formed pairs of guide segments 28 and 28ª similar to those shown in Figs. 1 to 5. These segments are united with webs 25 as shown and are separated from the flange 23 by slots 29 and further isolated from the head by slots 29ª in the walls 25. The guide segments of each pair are separated from one another by longitudinally extending slots 30.

It will be seen that this last form of construction is based upon the same principles as the first form and further detailed description is therefore unnecessary. The main difference between the last form of construction and that first described resides in the webs 25 which support the wrist pin bosses and the guide portions, said walls being joined to the head structure at the lower edge of the ring flange 23 rather than springing from the head disc as in the first form of construction.

From the foregoing description the operation of pistons embodying my improvements will readily be understood. It will be seen that an aluminum alloy piston embodying my invention can be fitted to the engine cylinder with a very small clearance and that compensation for the relatively large thermal expansion of the guide section of the piston is provided by the displacement of the guide segments which results from the reaction force of the cylinder wall on the outer faces of the guides. As above indicated the reaction force necessary to displace the guide parts and effect such compensation can readily be controlled by properly forming and proportioning the guide parts. In this connection it will be obvious to the designer that account must be taken of such factors as compression pressures, piston diameter and piston stroke as determining the lateral thrust to which the guide parts will be subjected. It is obvious that the compensating displacement of the guide parts should require a thrust great enough to insure adequate mechanical strength of the piston and small enough to obviate scoring of the piston and cylinder or seizure of the piston.

While I have shown my invention applied to the slipper type of piston as distinguished from the skirt type it is to be understood that the invention is essentially applicable to other forms of construction, the scope of the invention being indicated by the appended claims.

What I claim is—

1. In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of webs integral with said head and having diametrically opposite piston pin bosses therein, a skirt integral with said webs relieved adjacent said webs and separated from the head by cir-

cumferential slots and provided with a longitudinal slot connecting the lower end of the piston with one of the circumferential slots.

2. In a piston for an internal combustion engine the combination of a head comprising a head disc and a peripheral flange having ring grooves therein, a pair of chordal webs, substantially rectangular in shape and located opposite each other in the piston, connected integrally at their upper edges to the peripheral flange of the piston, diametrically opposite wrist pin bosses, one in each of said webs, a skirt for said piston integrally connected to each of the side edges of the webs and cut away so as to expose each of the rectangular webs and the piston pin bosses from the outside of the piston, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

3. An internal combustion engine piston comprising a head having a depending ring flange, webs integrally cast to the ring flange and depressed within the circumference defined by the ring flange, wrist pin bosses cast in the webs, and curved guide means integrally cast to the webs and provided with a longitudinal slit disposed between the ends of the webs on one side of the piston, the outer surface of the guide means being disposed in a circumference outwardly of the outer surface of the webs and merging into the latter at included angles sufficiently great to permit the removal of a permanent mold part used to form the outer surface of the piston.

4. In a piston for an internal combustion engine, the combination of a head having a depending circumferential flange provided with ring grooves on the exterior thereof, chordal webs integral with the head and depending therefrom in opposite positions, piston pin bosses, one located in each web opposite each other, a skirt portion cut away from the head to expose the bosses in the webs and provided with curved bearing faces integral with the webs and connected to the ends of the webs opposite each other, each of said bearing faces being separated from the head except for the integral connection through the webs and one of said bearing faces having a substantially vertical slot therein.

5. In a piston for an internal combustion engine, the combination of a head having a depending circumferential flange provided with ring grooves on the exterior thereof, chordal webs integral with the head and depending therefrom in opposite positions, piston pin bosses one located in each web opposite each other, ribs integral with and substantially perpendicular to the webs joining the webs and the head, a skirt portion cut away from the head to expose the bosses in the webs provided with curved bearing faces integral with the webs and connected to the ends of the webs opposite each other, each of said bearing faces being separated from the head except for the integral connection through the webs and one of said bearing faces having a substantially vertical slot therein.

6. In a piston for an internal combustion engine, the combination of a head having a depending circumferential flange provided with ring grooves on the exterior thereof, chordal webs integral with the head and depending therefrom in opposite positions, piston pin bosses, one located in each web opposite each other, ribs integral with and substantially perpendicular to the webs joining the webs, the bosses and the head together, a skirt portion cut away from the head to expose the bosses in the webs and provided with curved bearing faces integral with the webs and connected to the ends of the webs opposite each other, each of said bearing faces being separated from the head except for the integral connection through the webs and one of said bearing faces having a substantially vertical slot therein.

7. A piston for an internal combustion engine comprising a head portion having a depending ring flange, a skirt portion, said skirt portion comprising a pair of substantially parallel webs carried by the head portion and provided with opposed wrist pin bosses, bearing portions carried by the ends of said webs and separated from the head by air gaps, the laterally outer faces of said web portions being free from laterally overhanging edge portions of the bearing faces, one of said bearing faces being provided with a longitudinal slot disposed intermediate the end portions of said bearing face.

8. In a piston for an internal combustion engine, the combination of a head having a cylindrical ring flange, oppositely disposed webs integral with the flange and carrying diametrically opposite piston pin bosses, a skirt, integral with said webs and cut away to expose the sides of said webs and separated from the ring flange by circumferential slits and provided with a longitudinal slit disposed between the ends of the webs.

9. In a piston for an internal combustion engine, the combination of a head comprising a disc and a peripheral flange having ring grooves therein, a pair of chordal webs connected to the flange of the head by outwardly flaring extensions, oppositely disposed wrist pin bosses in the webs, and a cylindrical skirt cut away to expose the webs and integrally connected to the ends of the latter, the skirt being separated from the head between the said webs by circumferential slits and the skirt having a longitudinally extending slit disposed between the ends of the webs on one side of the piston.

10. In a piston for an internal combustion engine, the combination of a piston head including a depending ring flange, oppositely disposed webs depending from the ring flange and disposed inwardly thereof, wrist pin bosses in the webs, and curved bearing means integrally connected to the webs and separated from the head by air gaps extending circumferentially of the piston between the ends of the webs, the said bearing means having a slit located between the ends of the webs and extending in a direction lengthwise of the piston.

11. In a piston of an internal combustion engine, the combination of a piston head having a cylindrical ring flange depending therefrom, webs integral with the flange extending convergingly inwardly of the piston from the opposite portions of the flange and then lengthwise of the piston in substantially parallel arrangement, wrist pin bosses in the webs, and a skirt joined to the ends of the webs on opposite sides of the bosses and cut away to expose substantially all of the sides of the webs, all the foregoing parts being integrally connected together, there being circumferentially extending air gaps separating the head and skirt between the webs and a slot in one side of the skirt between the ends of the webs and extending in a direction lengthwise of the piston.

12. In a piston for an internal combustion engine, the combination of a piston head comprising a disc with a depending peripheral ring flange, a skirt separated from the head by circumferentially extending air gaps, chordal webs integrally connected at their ends to the skirt with their outer surfaces near the points of connection with the skirt diverging outwardly to merge into the outer surfaces of the skirt, wrist pin bosses integrally formed with the webs, and integral connections between the depending flange of the head and the adjacent ends of the webs, said connections extending from the flange inwardly and lengthwise of the piston and merging into the webs with outwardly diverging surfaces, the skirt having a longitudinally extending slit formed on one side thereof between the ends of the webs.

In testimony whereof, I hereunto affix my signature.

UNITED STATES PATENT OFFICE.

HOWARD R. MAYNARD, OF DETROIT, MICHIGAN, ASSIGNOR, BY DIRECT AND MESNE ASSIGNMENTS, OF ONE-HALF TO CHRYSLER CORPORATION, OF HIGHLAND PARK, MICHIGAN, A CORPORATION OF DELAWARE, AND ONE-HALF TO ALUMINUM COMPANY OF AMERICA, OF PITTSBURGH, PENNSYLVANIA, A CORPORATION OF PENNSYLVANIA.

PISTON.

Application filed January 5, 1921. Serial No. 434,467.

The invention relates to pistons designed for use in internal combustion engines and has for its object the prevention of "pumping" of oil and the "freezing" due to excessive expansion. In the present state of the art it is usual to construct pistons with a cylindrical ring portion having a relatively large clearance with reference to the diameter of the cylinder, and a skirt portion more closely fitting the same and which holds the piston in proper alignment and prevents side slapping. To avoid sticking or freezing of this skirt, due to expansion, certain constructions of pistons have provided the skirt with a longitudinal slot therein to compensate for expansion, but there is one serious difficulty with all such constructions, viz, the tendency for the lubricating oil to work up beyond the skirt and rings and into the explosion chamber. This results in the formation of carbon and other difficulties incident thereto. With the present invention I have overcome this difficulty by arranging between the cylindrical ring portion and the skirt portion a continuous annular groove. This will receive the oil creeping past the skirt and permitting the same to drop back in the cylinder without providing any bridge for its passage to the ring portion. The result is that the cylinder will be fully lubricated, while the excess of lubricant will be scraped off by the lowermost piston rings into the annular groove, where it is permitted to drop back into the cylinder.

In the drawings:

Figure 1 is a perspective view of my improved construction;

Figure 2 is a transverse section thereof; and

Figure 3 is a similar view in plane at right angles to Figure 2.

A is the piston head having a depending cylindrical portion B grooved to receive the rings C and of a diameter to afford abundant clearance within the engine cylinder. D is a skirt, which is preferably of a diameter to closely fit the cylinder. This skirt is itself discontinuous with the cylindrical portion B of the piston, being separated therefrom by a groove E, which extends completely around the same. The connection between the two parts is formed by webs F on diametrically opposite sides of the piston, said webs extending inward from the portion B and vertically downward and having formed integral therewith the bearings G for the wrist pin. These webs are connected to the skirt on their opposite vertical edges, but are not connected thereto either at top or bottom. Thus there are formed the recesses H surrounding the bearings G with segmental skirt portions on opposite sides thereof and an annular skirt portion below said segmental skirt portions. One of the sides of the skirt between the points of attachment of the webs thereto is longitudinally slitted, as indicated at I, and this slit compensates for expansion and permits the skirt to conform itself to the cylinder.

With the construction as described, when the piston is in operation, the lubricant upon the wall of the cylinder is spread by the skirt portion of the piston and will be forced upward to the groove E at the upper end of the skirt. Further creeping is prevented by this groove and when the accumulation of oil is sufficient, it will drop back inside of the skirt. At no time is there a body of the oil adjacent to the piston rings and for this reason when the engine is upon suction stroke, any leakage past the ring cannot draw oil upward. As a further safeguard, the cylindrical portion B below the lowermost of the ring C is cut away to provide a further clearance, as indicated at J, this clearance being sufficient to prevent the bridging of the oil thereacross. Thus on each downward stroke of the piston, the lowermost ring will scrape all surplus oil from the surface of the cylinder and in the upward stroke the oil thus accumulated will pass through the groove E and downward. Any oil accumulating in the recesses H will follow down the webs F and there is no chance at any point for the accumulation of oil adjacent to the rings.

What I claim as my invention is:

1. A piston comprising a head having a cylindrical ring portion depending therefrom and a skirt portion arranged beneath said ring portion and separated therefrom by a continuous annular groove, said skirt having a pair of spaced segmental portions, webs on

diametrically opposite sides of the piston, extending inward from said cylindrical portion and vertically downward, the opposite edges of said webs being connected to the said segmental portions of the skirt, and said skirt having an annular portion below said segmental portions disconnected from the lower ends of said web.

2. A piston comprising a head having a depending cylindrical ring portion of relatively large clearance with respect to the diameter of the cylinder, and a skirt portion below said ring portion closely fitting said cylinder and separated from the ring portion by a continuous annular groove, webs on diametrically opposite sides of said piston extending inward from said cylindrical portion and downward parallel to each other, the opposite vertical edges of said webs being connected to the skirt, said skirt having an annular portion below said webs disconnected from the lower ends of said webs and there being also provided a slit completely through the skirt from the lower to the upper end thereof, and wrist pin bearings carried by said webs.

3. A piston comprising a head, a cylindrical skirt beneath said head having recesses in diametrically opposite sides thereof, parallel webs extending downwardly from said head and having the opposite side edges thereof connected to the side edges of the recesses in said skirt, separating openings being provided between the lower ends of said webs and said skirt and between the upper edges of said skirt and said head, and wrist pin bearings carried by said webs.

4. A piston comprising a head having a depending cylindrical portion provided with annular grooves, rings engaging said grooves, the cylindrical portion below the lowermost ring being cut away, a cylindrical skirt beneath the cylindrical portion of said head and having recesses in diametrically opposite sides thereof, webs extending downwardly from said head and having the opposite side edges thereof connected to the side edges of the recesses in said skirt, separating openings being provided between the lower ends of said webs and said skirt, and wrist pin bearings carried by said webs, one side of said skirt between the points of attachment of said webs thereto being slit longitudinally.

5. A piston comprising a head, a cylindrical skirt beneath said head, parallel webs extending downwardly from said head and connected to said skirt separating recesses being provided between the lower ends of said webs and said skirt and between the upper ends of said skirt and said head, one side of said skirt between the points of attachment of said webs thereto being slitted longitudinally, and wrist pin bearings carried by said webs.

6. In a piston for an internal combustion engine, the combination of a head, a plurality of webs integral with said head and having oppositely disposed wrist pin bosses mounted one in each web, a skirt integral with said webs relieved adjacent said webs to a point between the bosses and the end of the skirt, said piston being provided with circumferential slots between the piston head and skirt and with a longitudinal slot connecting the open end of the skirt with one of the circumferential slots.

7. In a piston for an internal combustion engine, the combination of a head and a plurality of webs integral with said head, diametrically oppositely disposed wrist pin bosses, one mounted in each of said webs and integral therewith, a skirt integral with said webs, relieved adjacent said webs, said relieved portion terminating between the bosses and the end of the skirt, said piston being provided with circumferential slots between the piston head and skirt, with a longitudinal slot connecting the end of the skirt with one of said circumferential slots, and with other circumferential slots between the end of the webs and the open end of the skirt.

8. In a piston for an internal combustion engine, the combination of a head provided with a disc portion and a flange portion and with ring grooves in the flange portion, a pair of substantially rectangular shaped webs integral with and depending from the flange portion of the head, a pair of oppositely disposed wrist pin bosses mounted one in each of said webs, a cross rib in said head and integral with the disc portion and flanges of the head and with said web and piston pin bosses, a skirt for said piston extending below said webs and integrally connected to the side edges of each of said webs, said piston being provided with circumferential slots between the skirt and head, with a longitudinal slot connecting one of said circumferential slots with the bottom edge of the skirt and with circumferential slots between the lower edges of the webs and the adjacent portion of the skirt.

9. A piston for an internal combustion engine, comprising a head, oppositely disposed walls depending from and connected at their upper ends to the head, bosses carried by the said walls out of direct contact with the head, and a skirt structure including two oppositely disposed bearing portions joined together by extensions below each of the said bosses and indirectly connected to the head by the said walls, the skirt structure being separated, by air gaps, from the head at its upper edge, and from the said walls below the bosses.

10. A piston for an internal combustion engine comprising a head, oppositely disposed walls depending from and connected at their upper ends to the head, the walls being depressed within the maximum diameter

of the piston, bosses carried by the said walls out of direct contact with the head, and a skirt structure, including two oppositely disposed bearing portions joined together by extensions below each of the said bosses and indirectly connected to the head by the said walls, the skirt structure being separated, by air gaps, from the head at its upper edge, and from the said walls below the bosses.

11. A piston for an internal combustion engine comprising an integral head and skirt, the said skirt consisting of oppositely disposed cylinder engaging bearing walls separated from the head by circumferential slots, a slot extending lengthwise of one of the said bearing walls, depressed walls connecting the said bearing walls, and other cylinder engaging walls connecting the first said bearing walls and separated from the said depressed walls by circumferential slots.

In testimony whereof I affix my signature.

HOWARD E. MAYNARD.

VICTOR E. SCHMIEDKNECHT, OF LOUISVILLE, KENTUCKY.

PISTON.

1,256,265. Specification of Letters Patent. Patented Feb. 12, 1918.

Application filed July 14, 1917. Serial No. 180,511.

To all whom it may concern:

Be it known that I, VICTOR E. SCHMIEDKNECHT, a citizen of the United States, residing at Louisville, in the county of Jefferson and State of Kentucky, have invented a new and useful Improvement in Pistons, of which the following is a specification.

This invention relates to pistons for internal combustion motors.

It has been ascertained to be essential that pistons of internal combustion motors should be as light as possible. In accordance with accepted construction pistons are hollow cylinders, closed at one end and open at the other, a connecting rod being secured interiorly thereof intermediate of their length by means of a transverse pin. Bosses projected inward from the side walls of the piston provide bearings for the pin. It was formerly thought that a shearing stress was exerted on this pin, and that the strain was transmitted to the side walls longitudinal thereof, and that the metal being under compression, the wall could be very thin, but failure of piston walls so constructed lead to the conclusion that the connecting rod exerted a bending stress on the pin by which a lateral strain was transmitted to the walls causing them to fracture around the bosses. This discovery necessitated an increase in the thickness of the walls and the use of braces or brackets extended from the bosses to the piston head, or to the wall, but these expedients tend to increase the weight of the piston. To reduce piston weight, resort has been had to the use of metals (such as aluminum, or alloys thereof) which have a lower specific gravity than cast iron, the metal commonly used; but the coefficient of expansion of aluminum is greater than that of iron, of which motor cylinders are generally made. Consequently it is difficult to get a proper fit, for if the piston is of such size as to fit in the cylinder properly when at maximum temperature, gas and oil will leak by, when as at starting, the piston is cool.

An object of this invention is to provide a piston of minimum weight, with maximum structural strength.

To the accomplishment of the foregoing and other objects, said invention consists of the novel construction, association and relative arrangement of parts, members and features hereinafter fully described and particularly pointed out in the claims appended hereunto.

In the drawing, wherein similar reference characters designate like parts in the several views, Figure 1, is a front elevation of an embodiment of the invention: Fig. 2, a side elevation thereof: Fig. 3, a central transverse section on Fig. 1: Fig. 4, a bottom plan view: and Fig. 5, a fragmental sectional view.

Referring now in detail to the drawing, the reference character —10— designates, as an entirety, a piston, the side walls, —11— of which are provided with a plurality of grooves —12— adapted for the reception of piston rings. An oil groove —13— is located just below the groups of piston ring grooves, and from the floor of this groove, a plurality of perforations —15— lead through the wall of the piston, and serve as an avenue of escape for oil that may accumulate beneath the lower ring during the down stroke of the piston. The floor of this groove, is suitably inclined to facilitate the operation of drilling the holes 15. The only portions of the apron of the piston (*i. e.*, that portion of the wall which depends below the pin) which bear efficiently against the walls of the cylinder are those, fore and aft, which lie in the plane of the movement of the connecting rod about the pin. The side portions (those below the ends of the pin) serve to steady the piston against lateral motion. I remove portions of said apron, leaving openings —16— each of which extends circumferentially approximately one third of the distance around the piston, and longitudinally from a point just below the oil groove to within a spaced distance of the lower end of the piston, leaving a band —18— of sufficient width to give a satisfactory bearing surface. Alined bearings —19— each of which has a suitable bore —20— for the reception of a piston pin, are attached at their outer ends to the band section at the upper edge of the openings —16—, centrally thereof. The inner end of each of the bearings is supported by a transverse bridge or truss —21— joined respectively, centrally to the bearings and terminally to the edges of the portions 17 of the apron of the piston.

It is thought that the many advantages

of a piston constructed in accordance with the foregoing description will be evident to those skilled in the art.

The walls may be considerable thinner than with the usual construction, as they are not subjected to lateral strain, the bearings being supported on the inner end by a bridge supported by the side walls, which gives great rigidity to them, offering a maximum resistance to the bending strain exerted by the pin. The removal of portions of the apron also serves to reduce the weight.

It is to be understood that applicant reserves the right to resort to such changes, modifications, and variations, as may properly come within the scope of the appended claims.

Having thus described my invention so that those skilled in the art may make and use the same,

I claim:

1. A piston comprising a head section and a depending apron having oppositely disposed openings therein, alined bearings the outer ends of which are suspended from said head section within said openings, and bridges sustaining the inner ends of said bearings.

2. A piston comprising a head section, and a depending cylindrical apron, said head section being provided with a plurality of grooves for the reception of rings, and an oil groove having perforations leading from its floor to the interior of the piston, said apron having an opening below said oil groove, a bearing the outer end of which is suspended from the head section at upper edge of said opening, and a transverse bar attached respectively to the inner end of said bearing and to the apron.

3. A piston, comprising a head, and a depending apron having an opening therein, a bearing the outer end of which is attached to the head at the upper edge of said opening, and a transverse bar adapted to support the inner end of said bearing.

VICTOR E. SCHMIEDEKNECHT.

UNITED STATES PATENT OFFICE.

LOUIS P. MOOREA, OF CINCINNATI, OHIO, ASSIGNOR, BY DIRECT AND MESNE ASSIGNMENTS, TO THE CLEVELAND TRUCK COMPANY, OF CLEVELAND, OHIO, A CORPORATION OF OHIO.

PISTON FOR INTERNAL-COMBUSTION ENGINES.

1,402,309. Specification of Letters Patent. Patented Jan. 3, 1922.

Application filed June 3, 1919. Serial No. 301,301.

To all whom it may concern:

Be it known that I, LOUIS P. MOOREA, a citizen of the United States, residing at Cincinnati, in the county of Hamilton and State of Ohio, have invented certain new and useful Improvements in and Relating to Pistons for Internal-Combustion Motors, of which the following is a specification.

The invention relates to improvements in pistons which are adapted especially for use in internal combustion motors.

One of the objects of my invention is to produce a simple, light, durable and efficient skirted piston peculiarly adapted to meet the conditions which exist in an internal combustion motor cylinder, including the stresses and strains imposed upon the piston, particularly during the explosion stroke, and by the high heat generated at this time, which must be efficiently and economically (1) utilized in the translation of heat into mechanical energy, and (2) that not translated into mechanical energy promptly dissipated.

My present invention comprises improvements on the joint invention of myself and Edward O. Spillman disclosed in [illegible] Patent of the United States No. [illegible].

It contemplates simplifying the construction and manufacture of pistons of this patented type and of considerably lightening the construction as compared with the integral cast structure illustrated in the said patent. It further contemplates the disposition of the parts which go to make up the piston relative to each other as in the piston embodying one form of this invention may be made readily in permanent molds.

It further contemplates the dissipating the heat from the head of the piston more effectively, as compared with the bosses, than is the case with the construction illustrated in the said Patent No. [illegible].

Other objects of my invention will be obvious to one skilled in the art from the description of one or more forms of the idea which I have herein disclosed for the purpose of [illegible] disclosure of my invention.

[illegible] master taken through the axis of the wrist pin bosses.

Fig. 2 is a section on the line 2—2, Fig. 1.

Fig. 3 is a bottom plan view looking into one of my improved pistons.

Fig. 4 is a section on the line 4—4, Fig. 1.

Fig. 5 is a longitudinal section taken through the axis of the wrist pin bosses of a modified form of piston embodying my invention.

Fig. 6 is a section on the line 6—6, Fig. 7.

Fig. 7 is a bottom plan view of the construction of piston illustrated in Fig. 5.

Fig. 8 is a side elevation of a piston casting after being taken from the mold and before any machining is done on it.

Fig. 9 is a side elevation of said piston casting after it has been externally machined and the slot made to provide the air gap between the head and the skirt portion of the piston.

Fig. 10 is a longitudinal section through the axis of the wrist pin bosses of another modified form of my invention.

Fig. 11 is a section on the line 11—11, Fig. 10.

Fig. 12 is a bottom plan view of the piston construction illustrated in Fig. 10.

Fig. 13 is a section on the line 13—13, Fig. 12.

Fig. 14 is a section on the line 14—14, Fig. 12.

In Figs. 1 to 4 inclusive, 1 is the skirt, body or guide portion of the piston, 2 is the top or piston head, and [illegible] connecting [illegible] with the skirt 1 and head 2 by connecting [illegible] 3 and 4. The [illegible] are cast integral with the skirt and head [illegible] and are [illegible] the axis of the piston [illegible] 5 is the wrist pin hole [illegible] 6 is the connecting rod [illegible] 7 is the wrist pin [illegible] 8 is the [illegible] 9 is the [illegible] 10 is the [illegible] 11 is the [illegible] 12 is the [illegible] 13 is the [illegible] 14 is the [illegible] 15 is the The upper end of the guide section or skirt is separated from the head 2 by an air gap. In the drawings, purely for the purpose of illustration, this air gap is shown wider than is necessary. The presence of this air gap or air space between the upper edge of the skirt or body section 1 and the lower edge of the peripheral portion 2* of the piston head, insures that the heat absorbed by the piston head principally will be transmitted inwardly and downwardly through the columns 3 so that such portion of it as does reach the skirt or body by conduction will do so at points below said air gap and will be reduced in amount so as to reduce relatively the expansion of the skirt as compared with the head, thereby permitting the skirt to be fitted relatively closely to the inner walls of the cylinder. While this air gap, as above indicated has been shown, for the purpose of illustration, wider than necessary, it will be understood that my invention contemplates any sort of a separated relationship between the upper end of the skirt and the adjacent head 2 because of which heat will not be transmitted efficiently or readily from the head to the skirt other than through a connector or connectors which join those two parts of the piston together. It will be understood that this relationship might be that of a poor mechanical fit or joint which would be a poor conductor of heat, as compared with the metal of the head 2 and connectors 3, so that such heat as did pass from the head 2 to the skirt 1 would do so principally by way of the connectors 3, rather than from the head to the upper end of the skirt 1 directly.

A piston of my improved construction may be made unusually light, durable and efficient by forming it of an integral casting of a metallic alloy having a relatively low specific gravity, such for example as an alloy of aluminum, copper and magnesium, or any other metallic alloy of aluminum or other low specific gravity metal known by those skilled in the art to be suitable for the construction of cast, skirted pistons. As the alloys of metals of relatively low specific gravity, suitable for such purposes, have relatively high coefficients of expansion, some difficulty has been experienced with the use of pistons made of them in internal combustion motors, due to the necessary clearance between the piston walls and the cylinder walls to allow for such expansion; as the result of which clearance, both "piston slapping" and "oil pumping" are likely to result, as is well known to those skilled in the art. Furthermore, liquid hydro-carbons are likely to escape past the piston into the crank case and thin down the lubricant below to an undesirable degree.

It will be understood that with a piston constructed in accordance with my invention, the sleeve or skirt 1 may be constructed so as relatively snugly to fit the inner walls of the motor cylinder, whereas the head 2 may be given a considerable amount of clearance between its outer surface and the inner wall of the cylinder to allow for all necessary expansion of the head due to the high temperatures to which it is directly subjected. The fit between the skirt and the inner wall of the cylinder may be a snug sliding fit and the area of the skirt which co-acts with the inner wall of the cylinder be such as to insure against slapping or rapping of the piston against the inner wall of the cylinder. In fact objectionable piston slap, incident to the operation of numerous types of pistons, for use in internal combustion motors, substantially is eliminated, by the use of a piston constructed in accordance with my invention. Likewise oil pumping is substantially eliminated and the passage of liquid hydrocarbons from the top of the piston to the crank case is practically eliminated, resulting in minimizing of undue and troublesome carbonization and undesirable smoking among other things.

Due to the fact that the skirt or sleeve 1 is maintained relatively cool under all normal conditions, the possibilities of scoring of the inner walls of the cylinder are practically eliminated.

The construction of a piston embodying my improvements, as hereinbefore described, may be readily carried out in permanent molds, which is not true of the construction illustrated in said Letters Patent No. 1,092,870, and I have had in mind the use of such permanent molds in the design of my said improvements.

The exterior walls of the skirt near the upper end thereof, where the connectors 3 join the skirt, may be relieved or recessed, as indicated at 1*, to allow for greater expansion at these points than will occur at other points in the same circumference of the skirt.

In the modification of my invention, illustrated in Figs. 5 to 7, inclusive, the lower piston ring groove is formed by the walls of a recess in the peripheral flange 2* of the piston head 2 and the upper end wall of the skirt 1. In this case the lower piston ring 5 may be used as and will operate as an oil wiper and will permit the oil to pass underneath it through the groove 1* in the upper end wall of the skirt 1 and leak into the crank case, thus assisting in keeping the motor from smoking. Where the piston rings are mounted as illustrated in Figs. 1 and 2, the air gap between the upper end of the skirt and the adjacent wall of the peripheral flange of the piston head will serve to provide an escape for oil past the

case from the cylinder walls and substantially eliminate undesirable smoking of the motor.

In the modified construction illustrated in Figs. 10 to 14, inclusive, all of the column or connectors 3 are disposed out of alignment with the wrist pin bosses 12. When thus disposed the amount of heat transmitted through such connectors to the wrist pin bosses will be somewhat reduced over that of a piston having the construction illustrated in Figs. 1 to 6, inclusive, as none of such connectors will transmit heat directly to either of the wrist pin bosses, there being a section of skirt between the connection of the lower end of each such connector with the skirt and the connection of the adjacent wrist pin boss with the skirt. Furthermore, with this last referred to modification the relief spaces or recesses in the outer wall of the piston adjacent the points at which the connectors 3 join the skirt will be so disposed as not to reduce any of the principal wearing surfaces of the piston against the inner wall of the cylinder.

In addition, with all the connectors 3 disposed in the regions of the pin bosses, as disclosed in Figs. 10 to 14, inclusive, the piston is especially well adapted to run with a close fit of the guide section 1 in the cylinder. It will be observed, on reference to Figs. 10, 13 and 14, that said guide section has a circumferential seam or bolt extending from the upper end down to and below the pin boss openings that is characterized by a short outer diameter on line with the bosses and a long outer diameter at right angles to said bosses, this being due to the above described relief of the piston adjacent the bosses and the connectors 3. Thus when this top zone of the guide bears up the resulting expansion can be accommodated by outward movement of the relieved part of the wall and danger of seizing as a result of close engagement between the unrelieved part of said wall and the cylinder is obviated. This action, of course, is made possible by the fact that the upper end of the guide section is not continuously joined to the head section but being connected to the head by the ribs 20, is free to flex or form in a manner independent of the head. The bottom part of the guide section does not attain as high a temperature as said upper zone so that no special provision for the expansion of said lower part is necessary.

It will [illegible] any [illegible] light in [illegible] tage in [illegible] the [illegible]

Pistons [illegible] be found [illegible] lently, smoothly and efficiently [illegible] cylinders of internal combustion engines and with greatly reduced skirt clearance over ordinary constructions of skirted pistons.

In making my improved pistons, I prefer to employ the following process. The casting may be formed in any suitable mold as a [illegible] While the invention is not limited to any particular method of casting it is to be observed that the improved construction is especially well adapted for casting in a permanent mold, the form and arrangement of the connectors 3 relative to the inner piston walls and the absence of any obstruction that would prevent free access to said inner walls from the open end of the piston, obviating all difficulties that exist in casting. The casting being made, by outer surface may be suitably machined or ground so as to leave the general external form illustrated in Fig. 9, or in Figs. 13, 13 and 14, and thereafter the head 6, including said wall 9 and peripheral wall 10, may be separated from the skirt 11 by inserting a cutting tool at 7, so as to form the air gap between the lower end wall of the peripheral flange 10 of the head and the upper end wall of the skirt. This separation of the head from the skirt may be effected before externally surfacing the casting, if desired. Any well known type of cutting mechanism may be employed for the purpose. After the cut 7 inside the exterior of the casting will have the general appearance illustrated in Fig. 8.

To those skilled in the art of making [illegible] of the cloth [illegible] many [illegible] sections of construction and widely different [illegible] of any explanation will suggest themselves without departing from the spirit and scope thereof. My disclosures and the descriptions herein are purely illustrative and are not intended to be in any sense limiting.

What I claim is:

1. An integrally cast piston [illegible] a skirt section having [illegible] and peripheral walls, a [illegible] separated at the upper edge from the lower edge of the peripheral wall of said head section by an air gap and [illegible] pin bosses and [illegible] which [illegible] and [illegible] the [illegible] of the [illegible] and [illegible] of the [illegible] and [illegible] walls of the [illegible]

eral wall of the head section across said air gap to the upper part of the guide section in the regions of said wrist pin bosses, the wall of said guide section being exteriorly relieved opposite said connectors.

3. A piston comprising a head section having end and peripheral walls, a guide section provided with diametrically opposite wrist pin bosses, and means connecting the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated by an air gap in the regions between said connecting means, and the guide section being exteriorly relieved in the regions of the bosses and connecting means.

4. An integrally cast piston comprising a head section having end and peripheral walls, a guide section provided with diametrically opposite wrist pin bosses, and means connecting the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated by an air gap in the regions between said connecting means and the guide section being exteriorly relieved in the regions of the bosses and connecting means.

5. A piston for an internal combustion engine comprising a guide section having a pair of diametrically opposed wrist pin bosses integrally formed therewith, a head having end and peripheral walls the lower edge of the latter being spaced from the upper edge of said guide section by a practically continuous non-conducting air gap, and connectors which extend from said peripheral wall downwardly to said guide section and are integrally formed with said peripheral wall and guide section, said guide section being exteriorly relieved in the regions of said connecting means.

6. An integral cast piston for an internal combustion engine comprising a guide section having a pair of diametrically opposed wrist pin bosses, a head section having end and peripheral walls, the lower edge of the latter being separated from the upper edge of said guide section by a relatively narrow air gap extending practically around the piston, and connectors which spring from said peripheral wall of said head and the upper end of said guide section and bridge said air gap, there being no cored-out space between any of said connectors and the adjacent side walls of the head and guide sections and said guide section being exteriorly relieved in the regions of said connecting means.

7. An integral cast piston for an internal combustion engine comprising a guide section having a pair of diametrically opposed wrist pin bosses, a head section having end and peripheral walls, the lower edge of the latter being separated from the upper edge of said guide section by a relatively narrow air gap extending practically around the piston, and connectors which spring from said peripheral wall of said head and the upper end of said guide section in the regions of said wrist pin bosses and bridge said air gap, said guide section being exteriorly relieved over continuous areas each embracing the region of one of said bosses and the adjacent connecting means.

8. A piston for an internal combustion motor, comprising a guide section having a pair of diametrically opposed wrist pin bosses integrally formed with the guide section, a head having end and peripheral walls, the lower edge of the latter being separated from the upper edge of the guide section by an air gap, and means disposed out of alignment with the axes of said wrist pin bosses and extending across said air gap and providing the sole means of connection between said head and guide section.

9. A piston for an internal combustion motor, comprising a guide section having a pair of diametrically opposed wrist pin bosses integrally formed with the guide section, a head having end and peripheral walls, the lower edge of the latter being separated from the upper edge of the guide section by an air gap, and connectors between the peripheral wall of said head and the guide section formed integral therewith and radially inset with respect to said peripheral wall and providing the sole means of connection between said head and guide section.

10. An integrally cast piston comprising a head section having end and peripheral walls, a guide section separated at its upper edge from the lower edge of the peripheral wall of said head section by an air gap and provided with diametrically opposed wrist pin bosses and section connectors between the head section and the guide section in the regions of said wrist pin bosses, said connectors being disposed radially inside the air gap and there being no cored-out space between any of said connectors and the adjacent side walls of the head and guide sections.

11. An integrally cast piston comprising a head section having an end wall and a peripheral wall formed with a plurality of ring grooves, a guide section provided with diametrically opposite wrist pin bosses, and means connecting the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated in the regions between said connecting means by air gaps disposed below the lowermost of said ring grooves and the guide section being exteriorly relieved in the regions of the bosses and connecting means.

12. An integrally cast piston comprising

a head section having end and peripheral walls, a guide section communicable therewith comfortably and provided with diametrically opposite orbit pin means and means connecting the head and guide sections in the region of said means, the upper edge of the guide section and the lower edge of the head being separated by an air gap in the region between said connecting means and the guide section being similarly separated in the region of the former said connecting means.

In testimony whereof I affix my signature, in the presence of two witnesses.

LOUIS P. MOORES.

ANNOUNCEMENT

Gentlemen:

We are specializing in a *Duplicate* Model "A" Ford Piston, for the replacement trade—Identical to that used as original equipment to all Model "A"s.

The exceptions are (1) head is centered—to facilitate finishing; (2) perpendicular slot is not completed (this to be finished after pin, rings and rod are assembled)—to reduce distortion hazards in transit; and (3) wrist pin holes are left undersize—for accurate pin fitting.

Bulletin, enclosed, will illustrate our attractive sales schedule. You will *not* find these prices equalled. The response, from the trade, on our Ford Piston proposition, is indicative of its merit.

As we are already behind on our delivery schedule —would encourage placing your order immediately for future delivery.

Yours very truly,

Sterling Products Corporation.

(Received Jun 13 1930 Evans & McCoy.)

EASTERN DIVISION

THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
Plaintiffs,

vs.

THE SIMMONS MANUFACTURING CO.,
Defendant.

IN EQUITY
No. 3510.

INTERLOCUTORY DECREE.

This cause coming on to be heard at this term of Court upon the pleadings and the petition of the Defendant, The Simmons Manufacturing Company, to be permitted to and the offer of said Defendant to consent to a decree admitting title to the patents in suit in the Plaintiff, admitting their validity and the infringement thereof by pistons like Exhibit No. B, filed with the answers to Plaintiff's interrogatories, and counsel having been heard upon these questions, it is therefore upon consideration thereof,

Ordered, Adjudged and Decreed as follows:

(1) That Letters Patent of the United States to Spillman & Mooers, No. 1,092,870, dated April 14, 1914, for Piston for Explosion Engines or Motors, is good and valid in law as to all of the claims thereof; that the inventors Edward O. Spillman and Louis P. Mooers named in said patent were the first, true, original and joint inventors of the inventions, improvements and combinations described in said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid:

That Letters Patent of the United States to Franquist, No. 1,153,902, dated September 21, 1915, for Piston, is good and valid in law as to all of the claims thereof; that the inventor, Gustave E. Franquist, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in

said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid;

That Letters Patent of the United States to Schmiedeknecht, No. 1,256,265, dated February 12, 1918, for Piston, is good and valid in law as to all of the claims thereof; that the inventor, Victor E. Schmiedeknecht, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid;

That Letters Patent of the United States to Mooers, No. 1,402,309, dated January 3, 1922, for Piston for Internal Combustion Motors, is good and valid in law as to all of the claims thereof; that the inventor Louis P. Mooers, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid;

That Letters Patent of the United States to Howdeshell, No. Re-16,273, dated February 23, 1926, for Piston for Engine Cylinders, is good and valid in law as to all of the claims thereof; that the inventor, Roland M. Howdeshell, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid;

That Letters Patent of the United States to Maynard, No. 1,655,968, dated January 10, 1928, for Piston, is good and valid in law as to all of the claims thereof; that the inventor Howard E. Maynard, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in said claims, and that the Plaintiffs, The Cleveland Trust Company and Chrysler Corporation, are the lawful owners of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid;

That Letters Patent of the United States to Jardine, No. 1,763,523, dated June 10, 1930, for Piston is good and

valid in law as to all of the claims thereof; that the inventor, Frank Jardine, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid;

That Letters Patent of the United States to Gulick, No. 1,815,733, dated July 21, 1931, for Piston, is good and valid in law as to all of the claims thereof; that the inventor, Edward J. Gulick, named in said patent was the first, true and original inventor of the inventions, improvements and combinations described in said claims, and that the Plaintiff, The Cleveland Trust Company, is the lawful owner of the entire right, title and interest in and to said inventions, and in and to the Letters Patent therefor as aforesaid.

(2) That the Defendant, The Simmons Manufacturing Company, has infringed upon said Letters Patent to Spillman & Mooers, No. 1,092,870, Franquist, No. 1,153,902, Schmidknecht, No. 1,256,265, Mooers, No. 1,40[illegible],309, Howdeshell, No. Re: 16,273, Maynard, No. 1,655,968, Jardine, No. 1,763,523 and Gulick, No. 1,815,733, within the Northern District of Ohio, Eastern Division, and elsewhere in the United States, by the sale of pistons employing or embodying the inventions set forth in each of said patents, as illustrated by Exhibit B; and the Defendant, The Simmons Manufacturing Company, has contributed to the infringement of each of said patents within the Northern District of Ohio, Eastern Division, and elsewhere in the United States.

(3) That Plaintiff do recover from Defendant, The Simmons Manufacturing Company, all profits, gains and advantages which the Defendant has, or shall have, derived, received or made by reason of said infringement, and that Plaintiff do recover from said Defendant any and all damages which the Plaintiff has sustained, or shall sustain by reason of said infringement by said Defendant.

(4) That this cause be, and the same is hereby referred to William B. Woods, Esq., a Master, to ascertain the amount of such gains and profits and the amount of damages sustained by the said Plaintiff by reason of such infringement; that the Defendant file its account with said Master in accordance with the Rules of Equity of

the Supreme Court of the United States relevant thereto; that on such accounting the Plaintiff shall have the right to cause an examination of the officers, servants, agents and employees of said Defendant, orally or otherwise, and also to cause the production of the Defendant's books, vouchers, accounts, bills of lading, shop orders and all documents relating to the pistons sold by Defendant, and that said Defendant, through its representatives, attend for such purpose before the Master from time to time as the said Master shall direct, and that all testimony and exhibits offered and used in this cause on behalf of either party may be referred to and used in such accounting.

That Defendant was duly notified under Section 4900 of the Revised Statutes of the United States of its infringement of said patents prior to the sale of any of the alleged infringing pistons by the Defendant, and that the Defendant continued to infringe notwithstanding said notice.

(5) That an injunction be issued out of and under the seal of this Court, directed to the Defendant, The Simmons Manufacturing Company, its officers, servants, agents, employees, workmen and all their privies, and each and every one of them, enjoining and restraining them during the remainder of the respective terms of said Letters Patent, all but Spillman & Mooers, No. 1,092,870, from directly or indirectly constructing or causing to be constructed and/or using and/or selling or causing to be used or sold or advertising for sale, pistons employing or embodying any of the inventions set forth in any of said patents, or apparatus, article or device to be used, or capable only of use, in a combination infringing any of said patents, and from infringing and contributing to infringement upon or violating any of said Letters Patent in any way whatsoever.

(6) That Plaintiff recover from the Defendant the Plaintiff's full cost in this suit to date and on any matter of accounting herein against this Defendant to be taxed and to have execution therefor.

Entered this 25th day of September, 1931.

JONES,

United States District Judge.

We consent to the entry of the above decree.

E. L. HYDE,

Counsel for Defendant, The Simmons

PLAINTIFFS' EXHIBIT NO. 26.

Conveyance, Declaration of Trust and Agreement between L. P. Mooers and George B. Pitts and The Cleveland Trust Company Dated March 7, 1922.

(Filed January 27, 1934.)

THIS CONVEYANCE, DECLARATION OF TRUST AND AGREEMENT, entered into at Cleveland, Ohio, as of the 7th day of March, 1922, by and between L. P. Mooers and George B. Pitts, of Cleveland, Ohio, First Parties, and The Cleveland Trust Company, a corporation of Ohio, Second Party.

Witnesseth, that

Whereas, the First Parties now own, control or hold the entire right, title and interest in, to and under certain Letters Patent of the United States for inventions or improvements relating and pertaining to and for use in or in connection with pistons for explosion engines or motors, a list of which marked "Inventions" is hereto attached and made part hereof; and

Whereas, said First Parties are desirous of assigning, transferring and conveying the "Property" embracing said "Inventions" hereinafter more fully described, in trust, for the uses and purposes hereinafter set forth, and are desirous of appointing and constituting the Second Party Trustee hereunder, with the respective powers, duties and discretions hereinafter set forth:

Now, Therefore, in consideration of the premises and of the covenants and agreements of the parties hereto, respectively, said parties have agreed and do hereby agree as follows, that

A. For the purposes of this agreement, wherever hereinafter used, the terms:

(1) "Property" shall mean and include (a) Each and all of the Letters Patent; (b) each and all of the applications for Letters Patent; (c) each and all of the inventions and improvements; (d) each and all of the licenses, and (e) all property, rights, money and proceeds of any and every nature whatsoever, which may be acquired, held, controlled, collected or received by said Trustee in connection with this trust and subject to the terms and provisions hereinafter set forth.

(2) "Grantors" shall mean and include the First Parties hereto.

B. For the purposes and objects expressed herein, and in order that the entire control, management and disposition of the "Property" may be vested in trust for the use and benefit of such persons or corporations as may from time to time be the beneficiaries hereunder, the Grantors hereby constitute and appoint the Second Party Trustee hereunder, with all the powers, duties and discretions as hereinafter set forth with reference to the "Property" and the management, control and disposition thereof.

C. Said First Parties, the Grantors, covenant and agree, that

(1) For the joint and several considerations hereinafter set forth, they will and hereby do sell, assign, transfer and set over to said THE CLEVELAND TRUST COMPANY, Trustee, and its successors in trust, the entire right, title and interest owned, held or controlled by them in, to and under each and all of the inventions or improvements embraced by said exhibit "Inventions" hereto attached, and in, to and under each and all of the Letters Patent of the United States and all other countries which have been or may be granted therefor, subject, however, to a license heretofore granted under certain of said Letters Patent to NORDYKE & MARMON COMPANY, of Indianapolis, Indiana, as of the date of April 23, 1920, and which license is hereby assigned and conveyed to this Trustee; in trust, however, for the uses and purposes, and subject to the terms, provisions and conditions hereinafter stated.

(2) At the time of the execution of this instrument, said First Parties own, control or hold the entire right, title and interest in, to and under each and all of said inventions or improvements enumerated and specified in said exhibit "Inventions" and the Letters Patent of the United States which have been granted therefor, subject to said license to NORDYKE & MARMON COMPANY, and that such interests and rights have not been encumbered; that they are free to transfer the same and that they have not entered into or executed and will not enter into or execute any assignment or agreement in conflict herewith.

(3) They and their heirs and legal representatives, without further compensation, will promptly execute and

deliver any further paper, assignments or instruments, and do all other acts which, in the opinion of counsel for said Trustee shall be necessary or convenient to secure to and vest in said Trustee the full and complete legal title to the "Property" aforesaid, or any of it.

D. Subject to the conditions and provisions hereinafter set forth, the Trustee shall be and it hereby is authorized and empowered as follows:

(1) To hold the title to the "Property," to determine upon and in its own name to institute and conduct suits, actions or proceedings at law or in equity relative to this trust, or in any way affecting the "Property," or any part of the same, including suits or proceedings to restrain or enjoin infringement of or to recover incomes or proceeds arising out of the "Property," and damages and profits of any and every nature whatsoever, including those arising from infringements of the Letters Patent, or any of them, embraced by this trust; to settle suits, actions or proceedings, at law or in equity, having to do with said "Property," or any of it, or with this trust, and to compromise or refer to arbitration any claims in favor of or against said trust; and likewise to defend actions or suits affecting said "Property" or this trust.

(2) To manage, develop and promote the "Property" and the interests of this trust, to endeavor to induce the use of said "Inventions or Improvements," and to endeavor to prevent the infringement of said "Letters Patent," or any of them.

(3) To grant, execute and deliver licenses relating and pertaining to said "Property," or any of it, without covenants of warranty, however, on the part of the Trustee, and to change or modify the terms, provisions and conditions thereof from time to time as it may deem to be for the best interest of the trust.

(4) To collect, receive and receipt for all license and royalty fees under said "Property," and all sums of money at any time coming due or belonging to said trust; and to hold, account for and disburse the same.

(5) To acquire and receive the title to and licenses under inventions or improvements, applications for Letters Patent and Letters Patent which, upon their acquisition, shall be included within the term "Property" as used herein.

(6) To execute and deliver such instruments as shall be necessary to convey or assign the "Property," or any

part thereof, without covenants of warranty, however, on the part of the Trustee.

(7) To determine and fix the terms and considerations upon which sales or purchases of property may be made, and to determine and fix the terms and considerations upon which licenses may be granted and executed by the Trustee with respect to the "Property," or any of it, belonging to this trust.

(8) To employ counsel, solicitors, agents and experts, when and for such purposes and periods of time as it may deem to be for the best interests of this trust.

(9) To determine finally what shall be treated as capital, what as income, and what as costs or expenses of the trust, for any and all purposes connected with or affecting this trust.

(10) To make advances or borrow money upon such terms and conditions, from time to time, for the improvement, protection or preservation of the property, or for the acquisition of additional property, whenever such may seem to it desirable or proper. For the repayment of such advances, with interest, the Trustee shall have a lien upon the trust property and for sums so borrowed may issue its promissory notes as Trustee, and secure the repayment thereof by mortgaging or pledging any part or all of the trust property.

(11) To exercise such other powers incidental to carrying out this trust as it shall find necessary and proper, provided, however, that the same shall not be inconsistent with the nature of the trust herein and hereby created.

E. (1) The Trustee hereby accepts said trust and agrees that, subject to and in accordance with the conditions and provisions hereinbefore and hereinafter contained, it will do all things which shall be necessary and proper, in its judgment, to protect and develop the "Property," for the benefit of the beneficiaries of this trust, who shall be trust beneficiaries only, without partnership, associate or any other relationship amongst themselves or between them and the Trustee; and that it will perform the specific duties herein required to be performed by it in accordance with the intentions herein expressed.

(2) It shall be the policy of the Trustee in the conduct of the trust to endeavor to induce or require all who use the patented inventions or improvements belonging

to this trust to recognize the Letters Patent relating thereto.

(3) The Trustee shall employ and keep competent representatives, for the purpose of dealing with all licenses embraced by this agreement, determining the amounts due thereon and collecting and receiving the royalties or income which shall be payable thereunder.

(4) The Trustee shall use its best endeavors regularly to collect all royalties and incomes which shall become due and payable under the licenses granted by it in connection with the "Property"; and shall take proper steps and proceedings and use its best endeavors to collect all sums which shall belong to this trust. And said Trustee shall keep all moneys in its hands as such Trustee, separate and apart from the assets of its Banking Department, but allowing interest thereon at the rate and subject to such rules as may from time to time be in force and effect in its Savings Department.

(5) The Trustee shall keep just and true books of account showing all collections and expenditures of any and every nature whatsoever made by it, and of the "Property" and rights of any and every nature whatsoever, received or acquired by it under the terms of this agreement, said books to be open at all reasonable times for inspection by the beneficiaries hereunder, or their duly authorized representatives; and shall furnish quarterly statements therefrom to the beneficiaries, and each of them hereunder. The fiscal accounting period hereunder shall be from January 1 to December 31, inclusive, of each year during the continuance of this trust.

(6) Quarterly, on the fifteenth day of February, May, August and November of each year during the continuance of this trust, the Trustee shall distribute and pay over to the beneficiaries entitled hereunder pro rata, in accordance with their respective shares as registered on the books of the Trustee, the balance of all revenues, moneys, proceeds of sale or disposition, and license fees or royalties collected by it from said "Property," up to the first day of each said calendar month, respectively, after the deducting therefrom

(1) The reasonable expenses of management and development of the "Property," including all taxes and compensation to the Trustee, and the payment of loans and advances and interest thereon made by or to the Trustee in the interest of this trust;

(2) Such sums of money as may be required in the acquisition of inventions and improvements, applications for Letters Patent, and Letters Patent, as hereinafter provided; and

(3) Such fund or funds as may from time to time hereafter be set aside in reserve, as hereinafter provided.

Furthermore, out of the income of the trust, the Trustee may set aside an allowance for depreciation and/or depletion of the patents, patent rights and other properties embraced by the trust and which shall be subject to depreciation and/or depletion. The Trustee, in determining the amount of such an allowance, shall take into consideration the measure of the depreciation and/or depletion, if any, then allowable as a deduction from the income of the trust, in accordance with the income tax laws of the United States, but the Trustee shall not be bound to adopt such measure as the appropriate measure of the depreciation for which it shall set aside an allowance. The Trustee in its absolute discretion, may either accumulate the fund resulting from the aforesaid allowances for depreciation and/or depletion throughout the life of the trust, or may employ it in connection with the Reserve Fund hereinafter provided for, or may from time to time distribute to the beneficiaries any part or all of the funds so accumulated, thereby reducing to such an extent the "Property." Any such distribution of allowances shall be made to the holders of the certificates of interest in this trust as they shall then appear on the records of the Trustee, and shall be made in proportion to the respective number of shares in said beneficial interest so appearing to be held by them. In any event, upon final distribution of this trust, as provided for in Article F (15) hereof, the entire amount of such accumulations then on hand and of said Reserve Fund, hereinafter provided for, then on hand, shall be distributed in the same manner as is provided for in the final distribution of other assets of the trust.

F. (1) The beneficial interest under this trust shall be represented by seven thousand (7,000) shares, evidenced by Trustee's Certificates of Interest, which said Certificates of Interest shall be in the form of the certificate hereto annexed and marked "Certificate of Interest," and shall be issued as follows:

Forthwith, after the execution of this agreement, the Trustee shall issue and deliver one (1) Certificate of Interest, in the form of the certificate hereto annexed and

marked "Certificate of Interest," which shall be for three thousand (3,000) shares, and be issued and delivered to L. P. Moores.

The remaining four thousand (4,000) shares or any part thereof may be issued, during the continuance of this agreement, by the Trustee, at such prices or for such property or property rights and upon such terms, conditions and provisions, including series denominations therefor, as said Trustee may deem to be for the best interests of the beneficiaries hereunder.

Such certificates and all like certificates issued by the Trustee hereunder, and the beneficial interest represented thereby, shall be transferable, in whole or in part, at all times, but subject to the terms and conditions of this agreement, and subject to such regulations as to transfer as the Trustee may prescribe, with the right in the transferee to receive from the Trustee a Certificate or Certificates of Interest, for the number of shares transferred to it or him; and the registered holder of any Certificate of Interest may be treated by the Trustee as the absolute owner thereof, and of all the rights of the original transferer (to the extent of the number of shares transferred), in the undivided interest in the "Property" represented thereby.

The Trustee shall have power to adopt appropriate rules and regulations in regard to the transfer of Certificates of Interest, and for registering such transfers, and from time to time to change such rules and regulations as occasion may require.

(2) No debt or liability shall be incurred by the Trustee, except such as may be incidental to the management and development of said "Property," and the Trustee shall have no power to bind the beneficiaries hereunder, or any of them, personally; and in every written contract which the Trustee shall authorize, enter into or make, reference shall be made to this Declaration of Trust; and each person or corporation, contracting or dealing with the Trustee, shall look to the funds and "Property" of the trust for payment under such contract or for the payment of any debt, judgment or decree, or of any money that may otherwise become due and payable; and neither the Trustee, nor any beneficiary hereunder, shall be personally liable therefor.

(3) The Trustee may from time to time, as it shall deem expedient, select, retain, employ and discharge such representatives, agents and counsel and such experts as it may consider are best fitted to serve the trust. And the

Trustee may thereupon act, through and on the advice of the person or persons so selected, retained and employed.

(4) The Trustee shall not be required to bring any suit or defend any suit with reference to the "Property" or to do any act or thing, under the terms of this instrument, which, in its judgment, may involve it in any liability unless and until indemnified to its satisfaction against any such liability and said Trustee shall be entitled to indemnity out of the "Property," as well as any funds held by it hereunder, including the Reserve Fund provided for in Article F (7) hereof, for any liability, loss, cost, damage or expense, which it may suffer or sustain in performing any of the terms and conditions of this agreement.

(5) Should the Trustee at any time during the continuance of this trust determine that it is for the best interest of this trust to acquire and receive inventions or improvements, applications for Letters Patent, or Letters Patent, for the purpose of including the same under this trust, it shall proceed to acquire and receive such property upon such terms and considerations as it shall deem appropriate.

(6) Should the Trustee determine that it is for the best interests of the trust to sell or otherwise dispose of the "Property" or any of it at any time, it shall designate, in writing, to the beneficiaries, the terms and considerations for the same, which in its opinion are adequate and for the best interests of the trust, and shall proceed to consummate such sale or disposition in conformity therewith, and the proceeds thereof shall become a part of the "Property" hereunder.

(7) The Trustee, from the moneys in its hands, may set aside a Reserve Fund, sufficient, in its judgment, to defray from time to time the expense of developing, promoting and protecting the "Property" and the cost of any litigation and proceedings connected with or incidental thereto, and to indemnify the Trustee against personal liability or loss, growing out of any action taken by said Trustee hereunder, but such fund shall not at any time exceed the sum of Seven Thousand Dollars ($7,000.00), unless contingencies arise which, in the opinion of the Trustee, justify the reservation of a larger sum in the best interests of the trust, whereupon, at its discretion, the Trustee may increase said Reserve Fund to Twenty-five Thousand Dollars ($25,000.00), for such period of time as it may deem to be expedient. Such Fund shall, so far as practicable, be placed at interest,

as provided for in Article E (4) hereof, and all income derived therefrom shall become a part of the "Property."

(8) The Trustee and any of its successors hereafter appointed may at any time resign the trust hereby created by giving not less than thirty (30) days' notice, in writing, to each of the beneficiaries hereunder by mail, to their addresses, respectively, as appear upon the records of the Trustee. In case of a vacancy caused by the resignation of the Trustee, or in case of the disability of the Trustee for any reason to perform the duties hereunder, a successor or successors to the Trustee shall be chosen as follows: Within ten (10) days from the date of such resignation or notice of such determination of disability, the Trustee shall make application to a Judge of the United States District Court of the Northern District of Ohio for the appointment by him of a successor Trustee or Trustees, and such Judge shall be and is hereby authorized and empowered to name and appoint a successor Trustee or Trustees to act hereunder; provided that should no Federal Judge for such District make the appointment, or there be no Federal Judge in the District, the Trustee shall make application to a Judge of the Common Pleas Court of Cuyahoga County, Ohio, who shall be and hereby is authorized and empowered to make such appointment.

Upon such appointment being made in either manner above prescribed, the successor Trustee or Trustees so appointed shall, upon written acceptance of the trust, become immediately vested with all the rights, power and trusts, and shall assume all the duties of THE CLEVELAND TRUST COMPANY as Trustee hereunder, with the same effect as if originally named as such Trustee; and said THE CLEVELAND TRUST COMPANY, or the party then occupying the position of Trustee, shall, upon demand of such successor Trustee or Trustees, or any one of them, account to such successor, and immediately execute all such assignments conveyances or other instruments as shall be necessary and proper fully to vest the successor Trustee or Trustees with all the right, title and interest in, to and under the "Property," including all sums of money which may then belong to said trust; and upon such accounting and conveyance and the delivery of such "Property," the Trustee, who has so resigned, or who has been removed, shall be from thenceforward relieved and discharged from responsibility hereunder.

(9) The Trustee may advise with counsel as to the interpretation of this instrument and as to any matter relating to the trust herein set forth, and shall be fully protected in any action or omission taken or suffered by it in good faith on the advice of such counsel, and it shall be protected in acting upon any notice, resolution, vote, request, consent, certificate, affidavit, voucher, bond or other paper or document, believed by it to be genuine and to be passed or signed by the proper party. Should the Trustee, in the performance of any of its duties herein and without affecting in any manner the irrevocable nature of this trust, deem it advisable to secure the assent or approval of the Certificate holders hereunder, it may do so by requiring their consent, in writing, to any course or plan of action, or any act or fact done or to be done, and the decision of a majority in interest of the Certificate holders shall be final and binding on all of them, and complete protection and authority to the Trustee. Nothing herein contained, however, shall be deemed to require the Trustee to secure or be bound by the assent or approval of the Certificate holders, or any of them, to any such course or plan of action, or to any act or fact done or to be done.

(10) Should any suit or suits be brought against the Trustee by reason of or because of anything done by it under this agreement and in pursuance thereof, and not resulting from its own bad faith or willful misconduct, or that of its agents, servants or representatives, in connection with or growing out of the terms and provisions hereof, the Trustee is authorized to defend such suits, and for that purpose to employ funds of this trust sufficient therefor, and to fully indemnify it in connection therewith.

(11) The Trustee shall not be liable hereunder for any loss arising out of the execution of this trust so long as it shall act in good faith; and said Trustee shall be liable hereunder only for the bad faith or willful misconduct of itself or its own agents, servants or representatives. In no event shall it be liable for any act or default of any counsel, solicitor, agent or expert, selected, retained or employed pursuant to the provisions of Article D (8), F (3) and F (9) hereof, provided reasonable care shall have been exercised by it in their selection. The Trustee shall not be required to give bond to secure the faithful performance of this trust by it, but in case of the appointment of a successor Trustee or Trustees, not a trust company, the said appointing Judge may, in

his discretion, require such security for the performance of the duties of such successor Trustee or Trustees as in his judgment is just and proper.

(12) The Trustee shall receive reasonable compensation from time to time for all of its services performed under this agreement.

(13) The death of a beneficiary holding a Certificate of Interest hereunder shall not operate to determine or in any manner affect this trust, but his Certificate of Interest shall pass to his executor, administrator, heirs, or legal representatives, and vest in them the ownership of such Certificate or Certificates of Interest, together with the interest in this trust represented thereby, in the same manner as it is held by the beneficiary.

(14) Whenever the Trustee is required under this agreement to communicate with or give notice to the beneficiaries hereunder, it may do so by written communication or notice mailed contemporaneously to each of the beneficiaries entitled to receive the same, addressed to the last known addresses, respectively, of such beneficiaries, as shown by the records of the Trustee.

(15) This trust shall continue until the expiration of all the Letters Patent which may hereafter become a part of the "Property" of said trust, or until all of the "Property" has been sold or disposed of, as hereinbefore provided, and until the Trustee has fully accounted for, distributed and paid over all moneys and "Property" received, or in any manner held by it hereunder.

(16) In the interpretation and construction of this instrument, the laws of the State of Ohio shall govern.

IN WITNESS WHEREOF, said L. P. MOORES and GEORGE B. PITTS have executed and delivered this instrument, and, as evidencing its acceptance of the trusts and confidences herein imposed upon it, said THE CLEVELAND TRUST COMPANY has caused this instrument to be executed and its corporate seal to be affixed hereto by executive officers, thereunto duly authorized, the execution and delivery being at Cleveland, Ohio.

L. P. MOORES,
GEORGE B. PITTS.

THE CLEVELAND TRUST COMPANY,
R. A. MALM,
Vice President.
A. J. PERPLER,
Assistant Trust Officer.

"INVENTIONS"

Patentee	*Number*	*Date*
Spillman & Mooers	1092,870	April 14, 1914
H. C. Marmon	1293,846	Feb. 11, 1919
L. P. Mooers	1347,819	July 27, 1920
L. P. Mooers	1402,308	Jan. 3, 1922
L. P. Mooers	1402,309	Jan. 3, 1922

and the undivided one-half of any right, title and interest now owned or held by said Louis P. Mooers in Letters Patent of countries foreign to the United States corresponding to said Letters Patent of the United States No. 1092,870.

This list forms a part of the Conveyance, Declaration of Trust and Agreement entered into as of the 7th day of March, 1922, between Louis P. Mooers and George B. Pitts and The Cleveland Trust Company.

CERTIFICATE OF INTEREST

No. .... Shares

THIS IS TO CERTIFY, that ....., Address ....., is owner of ..... shares of undivided interest in the net profits and avails, when the same may be distributable, from certain "Property" comprising certain Inventions or Improvements, Applications for Letters Patent which have been or may be filed therefor and Letters Patent which may be granted thereon, and rights thereunder, more particularly described in a certain Conveyance, Declaration of Trust and Agreement entered into as of the 7th day of March, 1922, by and between L. P. MOOERS and GEORGE B. PITTS, therein referred to as "Grantors," and THE CLEVELAND TRUST COMPANY, therein referred to as "Trustee," a copy of which is on file at the principal office of said THE CLEVELAND TRUST COMPANY, in the City of Cleveland, Ohio, and open to the inspection of any holder of this Certificate, and that the legal title to said property is held by said THE CLEVELAND TRUST COMPANY for the use and benefit of the various registered owners of interests therein, subject to and in accordance with the provisions of the aforementioned Conveyance, Declaration of Trust and Agreement so on file, reference to which is hereby made for a description of the nature and extent of the "Property," the rights and privileges of the holders of said Certificates of Interest, and the terms and conditions upon which said Certificates are issued. The holder of

this certificate, by acceptance hereof expressly ratifies all of the terms and conditions of said Conveyance, Declaration of Trust and Agreement. THE CLEVELAND TRUST COMPANY assumes no responsibility as to the validity of the title to the "Property" purported to be conveyed to it in trust, pursuant to the aforementioned Conveyance, Declaration of Trust and Agreement. The registered holder of this Certificate may be treated as the actual owner of this Certificate and the interest represented thereby for all purposes whatsoever.

This Certificate and the interest evidenced thereby may be transferred upon surrender thereof to the Trustee, duly endorsed, and subject to such rules and regulations governing transfers as the Trustee may establish.

THE CLEVELAND TRUST COMPANY,

PLAINTIFF'S EXHIBIT NO. 24.
Gallick Mill Patent.
(Filed January 27, 1934.)

PLAINTIFFS' EXHIBIT NO. 37.

Gulick Written Description.

(Filed January 27, 1934.)

Relating to an Engine Piston which provides for and prevents seizing binding or scoring when hot or oversize. It is a well known fact that all engine Pistons are necessarily made smaller than the cylinders in which they operate to provide for lubricant and prevent seizing or cutting due to the expansion of the piston in the cylinder when hot.

1. The Piston consists of a Head 1—having a groove 6—for carrying packing Rings and a Body 2 which provides Bearing surface and which is split as indicated by 7 to provide for expansion.

2. The Head 1 and Body 2 are held together by the ribs 3 and 4. Ribs 3 and 4 carry Bosses 5 for receiving the piston pin. Ribs 3 and 4 are not limited to shape or position and the no of ribs and location and shape may be altered as desired.

The head 1 is machined small enough to allow for expansion and not bind or seize, while the Body 2 is machined as close to size as is possible to make a fit and any expansion is taken up by the slot 7—and which prevents any seizing or Binding between the piston and cylinder walls in which the piston moves. By this construction it is possible to make a fit that prevents any pounding which is prevalent with the common type of Piston.

PLAINTIFFS' EXHIBIT NO. 38a.

Supplemental Contract between The Cleveland Trust Company and Aluminum Company of America dated April 26, 1924.

[Also offered as Defendants' Exhibit 4-T.]

(Filed January 27, 1934.)

This AGREEMENT made and entered into this 26th day of April, 1924, by and between THE CLEVELAND TRUST COMPANY, of Cleveland, Ohio, hereinafter sometimes called the licensor, and ALUMINUM COMPANY OF AMERICA, a Pennsylvania corporation of Pittsburgh, Pa., hereinafter sometimes called the licensee.

WITNESSETH:

WHEREAS, the parties hereto have of even date entered into a contract hereinafter sometimes called the license agreement, a copy of which is attached hereto and marked Exhibit "D," and to which this contract is a supplement.

NOW, THEREFORE, in consideration of the premises and of the covenants and agreements of the parties hereto made herein and in the license agreement, a copy of which is attached hereto and marked Exhibit "D," said parties have covenanted and agreed, and do hereby covenant and agree with each other further as follows:

1. In case the royalty per piston payable by any sub-licensee to the licensee, under the license agreement, is established at less than one cent ($.01) per piston by Board of Arbitration or others acting beyond the control of the licensee, the licensor shall accept the royalty so set at less than one cent ($.01) per piston as a royalty in full to be paid by the licensee hereunder for all pistons made and/or sold by such sub-licensee.

2. The licensee shall make vigilant effort to collect all royalties accruing from the sub-licensees under their sub-licenses, respectively. If the licensee is unable, after the exercise of due diligence, to collect royalties due from any sub-licensee, the licensee will be relieved from paying to the licensor the licensor's proportion of such uncollectable royalties, and if the licensee has advanced to the licensor any royalties which prove to be uncollectable, the licensor will refund to or credit the licensee with the amount of such uncollectable portion so advanced. After the licensee has notified the licensor that any royalties are uncollectable, the licensee will, upon

demand in writing from the licensor, assign the licensor's proportion of such uncollectable account to the licensor.

3. In case the license agreement is cancelled for any reason whatsoever other than because of failure of the licensee to carry out its obligations or any of them to the licensor thereunder, the licensor agrees to reassign to the licensee all patents, patent applications or other patent rights which have been assigned by the licensee to the licensor under said license agreement (Exhibit "D" attached hereto), subject, however, to any and all licenses and sub-licenses which have been granted either by the licensor or the licensee or which the licensor is under contract to grant with respect to such patents, patent applications or other patent rights to (1) Walker M. Levett Company and W. M. Levett Corporation of New York; (2) The National Piston Company, Incorporated, of New York and (3) The Kant-Skore Piston Company, of Cincinnati, Ohio, copies of which contracts are hereto attached and marked Exhibits E, F and G, respectively.

In Witness Whereof the parties hereto have caused this instrument to be executed in duplicate by their respective officers hereunto duly authorized as of this 26th day of April, A. D. 1924.

PLAINTIFFS' EXHIBIT NO. 38b.

License Agreement between The Cleveland Trust Company and Aluminum Company of America.

[Also offered as Defendants' Exhibit 4-S.]

(Filed January 27, 1934.)

LICENSE AGREEMENT

This license agreement made and entered into by and between THE CLEVELAND TRUST COMPANY, of Cleveland, Ohio, hereinafter called sometimes the licensor, and ALUMINUM COMPANY OF AMERICA, a Pennsylvania corporation, hereinafter sometimes called the licensee, witnesseth:—

WHEREAS, the Licensor owns the entire right, title and interest in and to the following Letters Patent and applications for Letters Patent in the United States—

Number	*Patentee*	*Date*
1,092,870	Spillman & Mooers	April 14, 1914
1,279,184	J. G. Vincent	Sept. 17, 1918
1,293,846	H. C. Marmon	Feb. 11, 1919
1,327,147	Harold D. Church	Jan. 6, 1920
1,347,819	L. P. Mooers	July 27, 1920
1,402,308	L. P. Mooers	Jan. 3, 1922
1,402,309	L. P. Mooers	Jan. 3, 1922
Ser. No. 204,661	E. J. Gulick, Filed	Nov. 30, 1917, and

has arranged to acquire the entire right, title and interest in and to Letters Patent 1,153,902 dated September 21, 1915, to Gustave E. Franquist and,

WHEREAS, the licensor may acquire other United States patents, patent applications and patent rights relating to pistons, and/or the processes and/or the machines for making the same, during the life of this agreement; and

WHEREAS, the said licensee is desirous of acquiring a license to make, use and sell the inventions included in the said patents and applications acquired and to be acquired by the licensor for the full term for which said patents are or shall be granted.

NOW, THEREFORE, in consideration of the premises and of the covenants and agreements of the parties hereto, respectively as hereinafter set forth, said parties have covenanted and agreed, and do hereby covenant and agree with each other as follows:

I.

The Licensor grants the licensee the exclusive right to make, use and sell and the exclusive right to grant to others the right to make, use and sell, the inventions and devices embodying the inventions covered by the patents and applications above named or to be covered by any continuations and divisions, renewals or reissues of the same, for the full term of each of said patents, with the exception that the licensor reserves to itself the right to make, use and sell and the right to grant to others the right to make, use and sell pistons made entirely of cast iron or steel, and it is specifically agreed that the licensor neither grants nor agrees to grant to the licensee in this agreement the exclusive right to make use or sell pistons made entirely of cast iron or steel, it being understood that the licensee has hereunder a non-exclusive license to make, use and sell, and the right to grant to others the right to make, use and sell cast iron or steel pistons embodying the inventions covered by the patents and applications above named, or to be covered by any continuations and divisions, renewals or reissues of the same, for the full term of each of said patents. This license and agreement will be automatically extended to cover any other and further patents or applications or other rights under patents which the licensor may acquire relating to pistons and/or processes and/or machines for making the same, unless excluded therefrom by the licensee as hereinafter provided, and the licensor agrees to execute any further instruments and perform any further acts, if any are required, to consummate the granting of licenses to the licensee or parties indicated by the licensee under this agreement. This license is subject to a license granted by The Cleveland Trust Company to Nordyke & Marmon Company, April 23, 1920, a copy of which is attached hereto marked Exhibit A.

II.

The Licenser releases and discharges the Licensee, all of its controlled and subsidiary companies, and Aluminum Manufacturers, Inc., and The Aluminum Castings Company, all sub-licensees under this agreement and all vendees and/or users of pistons, the castings for which were heretofore acquired from the Licensee or either of the said companies, or said sub-licensees, from any and all claims whatsoever for damages or profits by reason

of any alleged past infringement of any of the patents aforesaid now owned by the Licensor and arising out of the manufacture, use and sale of such pistons; and from any claim or claims for past damages or profits which shall be acquired by the Licensor in the future, during the continuance of this agreement, and theretofore arising out of the manufacture, use and sale of such pistons; and agrees not to institute or to aid or abet the institution of any suit against the Licensee or any of its controlled and subsidiary companies, or Aluminum Manufactures, Inc. or The Aluminum Castings Company, or sub-licensees, or the vendees or users of pistons, the castings for which were heretofore acquired from the Licensee or either of the said companies, or said sub-licensees, for any alleged past infringement of any patents relating to the subjects covered by the patents or applications named herein or for damages and profits because of alleged past infringement thereof and heretofore arising out of the manufacture, use and sale of such pistons.

III.

1. (a) The Licensor shall institute and prosecute to a conclusion with due diligence suit or suits against any or all infringers of the patents included within the terms of this agreement necessary reasonably to protect the interests of the licensee acquired hereunder, provided that the licensor be indemnified to its satisfaction by the licensee for any costs or expenses which the licensor may suffer or sustain in connection with or growing out of any such suit.

(b) The licensor shall defend any suit or suits, so far as such defence shall be necessary reasonably to protect the interests of the licensee acquired hereunder, brought because of the alleged infringement of any letters patent covering the design of pistons made, sold or used under this agreement and for which royalties are paid under this agreement, provided that the licensor be indemnified to its satisfaction by the licensee for any costs or expenses which the licensor may suffer or sustain in connection with or growing out of any such defense.

2. Should the licensor bring and prosecute or defend as above provided such infringement suit or suits at its own expense, all profits or damages recovered in said suit or suits shall be the absolute property of the licensor.

3. In the event of the failure of the licensor promptly to institute and vigorously prosecute or to defend such suit or suits as may be necessary reasonably to protect the interests of the licensee hereunder, then and in that event, the licensee having reasonably indemnified the licensor, may in the name of the licensor or the names of the licensor and licensee jointly institute or adopt and diligently prosecute or defend at the licensee's expense such suit or suits as may be required reasonably to protect its interests. The licensor at any time shall have the right to join in the prosecution or defense of such suit or suits with its own counsel and at its own expense.

4. Should the licensee bring or prosecute or defend as above provided any such infringement suit or suits or should the licensee furnish indemnification to the licensor in connection with suits brought or prosecuted or defended by the licensor and pay any sum on account of such indemnification, it shall have the right to apply all royalties payable by it on the reasonable costs and expenses of such suit or suits, including attorney's fees, or on said sum paid on account of indemnification and shall apply the sum, if any, recovered in any such suit, first, to the reimbursement of it for said reasonable expenses and costs, including attorney's fees, and not theretofore reimbursed to it out of royalties or sums paid on account of indemnification, and second, to the payment to the licensor of all sums theretofore deducted by the licensee from royalties and applied to the said reasonable costs and expenses, including attorney's fees, of such suit or payments of indemnification and the balance shall be the absolute property of the licensee.

IV.

The Licensee agrees that it will within the months of January, April, July and October of each year from and after the execution hereof, furnish to the licensor, its successors or assigns in interest, a written statement under oath which shall show:—

(a) the number of pistons made by or for it, imported by it and sold or otherwise disposed of by it during the preceding three calendar months which contain or which to the licensee's knowledge are to be modified or fabricated by the licensee's vendees to contain and embody any invention covered by any of the claims of any of the letters patent and application recited herein, or in the future

acquired by the licensor and included herein. This report shall be made whether the licensee makes or sells any pistons during the preceding royalty period, or not, and

(b) the number of such pistons sold by the licensee and for which the vendee has been subsequently credited.

The first report shall include the pistons contemplated in this paragraph between January 1, 1924 and April 1, 1924.

V.

The Licensee will pay the licensor royalty of one cent ($.01) upon each piston sold* or otherwise disposed of by it during the life of this agreement embodying in its construction any invention covered by one or more of the claims of the letters patent and application named herein or in the future acquired by the licensor and added hereto, and upon each piston made and sold by the licensee with the intention or the knowledge of the licensee that it shall be modified or fabricated by the licensee's vendee in such a way as to embody in its construction any invention covered by one or more of the claims in the letters patent or applications covered hereby.

It is understood that no royalties will be payable or collectible upon the licensed pistons which have been sold and for which the vendee thereof has been subsequently credited, and that if any royalties have been paid upon the licensed pistons which are sold, and for which the vendee has been subsequently credited, the licensee shall have credit therefor upon the next due payment.

VI.

Within thirty (30) days after it shall have furnished, in January, April, July and October of each year, statements specified in the paragraph herein numbered (IV), the licensee shall and will pay to the licensor, its successors or the assigns of its interest in said letters patent, the royalties upon the pistons covered by said reports, at the rate prescribed.

---

*Sold in this contract means and includes only licensed pistons which are both contracted for and delivered, during the life of this agreement.

VII.

The licensee agrees that it will keep accurate books of account, giving full particulars of the licensee's business in the inventions covered by this agreement and will in the event of controversy admit the licensor or its duly accredited agent at all reasonable times to inspect the same.

VIII.

In the event that the combination set forth in any of the claims of the application for letters patent and of the letters patent to be granted thereon above recited and the letters patent above recited or acquired in the future and added hereto is held by a court of final jurisdiction or by an inferior court from whose decree no appeal is taken or the appeal is denied or dismissed, to be an infringement of any other patent in any patent suit brought in the United States against the licensor, the licensee, any other of the licensor's Licensees, any sub-licensees or any of its or their vendees, the licensee shall have, and is hereby given, the right and option to exclude from this license any such claim or claims or the letters patent or application for letters patent containing such claim or claims, as the case may be, and to have the royalty payable hereunder reduced proportionately if any, to the reduction, caused by such judicial holdings in the value of the patents and applications comprehended by this agreement, such proportion to be determined by arbitration as hereinafter in paragraph (XX) hereof provided, or to terminate this agreement altogether by giving to the licensor notice in writing of its election so to do within six (6) months from the rendition of the judicial holding of the court of final jurisdiction or after the expiration of the time for appeal or after the appeal has been denied or dismissed.

IX.

The licensor authorizes and empowers the licensee to grant sub-licenses to manufacture, make, use and/or sell within the United States pistons which contain and embody any inventions covered by any of the claims of any of the letters patent and applications for letters patent comprehended herein; provided that each and every such sub-license so granted shall expressly refer to this license, shall be of no greater scope than this license and shall terminate therewith; and provided further that all

royalties payable by the sub-licensee shall be payable directly to the Aluminum Company of America or its order and the proportion thereof due to the licensor, namely, one cent ($.01) per piston, shall be payable forthwith to the licensor by the licensee hereunder.

X.

This agreement and license shall be transferable to the successors or assigns of either of the parties hereto, but in that event the successors or assigns shall be bound by the provisions of this agreement and obligated to conform thereto.

XI.

The licensee will not during the life of this agreement contest, or aid others in contesting the validity of any of the letters patent included within this agreement or afterwards acquired by the licensor and included in this agreement.

XII.

The licensee can have and hereby is given the right and option to exclude from this license any letters patent or application for letters patent or other patent rights which the licensor may acquire after the execution of this license provided the licensee gives the licensor notice in writing of such exclusion within ninety (90) days after notice in writing to the licensee by the licensor of the acquisition of any letters patent or applications or other patent rights, not recited in this agreement.

XIII.

The licensee shall pay royalties only upon pistons both contracted for and delivered during the term of this license,—pistons contracted for before or delivered after the term of the contract are free of royalties.

XIV.

If either of the parties hereto neglects or refuses to keep any of its covenants herein, then the other party hereto may serve on the derelict party by registered mail a notice in writing of such default and if the derelict party shall continue such default for thirty (30) days after the serving of such notice, then the aggrieved party may at its option cancel this license by a notice in writing of such cancellation and termination, provided, how-

ever, that the foregoing remedy shall not exclude any other remedy which the aggrieved party may have at law or in equity. The waiver of any breach by either party shall not be interpreted as constituting a waiver of any further breach or breaches.

XV.

The licensor hereby grants to the licensee the exclusive right to make, use and sell the inventions covered by any foreign patents or applications for foreign patents, which the licensor now owns or controls which relate to pistons with the exception that the licensor reserves to itself the right under such foreign patents to make, use and sell and the right to grant to others the right to make, use and sell pistons made entirely of cast iron or steel. The licensor agrees to release the licensee, its subsidiary and controlled companies, the Aluminum Manufactures, Inc., The Aluminum Castings Company, their vendees, and all users of their pistons, from any claim or claims for alleged infringement of foreign patents, which the licensor now has or in the future may acquire against any of them. It is specifically agreed that the licensor neither grants nor agrees to grant to the licensee in this agreement the exclusive right to make, use or sell pistons made entirely of cast iron or steel under such foreign patents. It being understood that the licensee has a non-exclusive license under, and the right to license others under such foreign patents to make, use and sell pistons embodying inventions covered by any foreign patents which the licensee now owns or controls when such pistons are made entirely of cast iron or steel. The Licensor agrees, upon demand of the licensee, to execute all instruments and perform all acts necessary to complete the licenses under this paragraph. This license and agreement will be automatically extended to cover any other and further foreign patents or applications for foreign patents or other rights under foreign patents which the licensor may acquire relating to pistons and/or processes and/or machines for making the same, unless excluded therefrom by the licensee as hereinafter provided, and the licensor agrees to execute any further instruments and perform any further acts, if any are required, to consummate the granting of licenses to the licensee or parties indicated by the licensee under this agreement.

XVI.

Should the inventions, for the use of which the Licensee pays royalty under this agreement, be made, sold or used generally by others, in the aluminum piston or automobile trade, not licensed under the patents included in this contract, forthwith upon the finding by arbitration as hereinafter provided that such a condition exists, the Licensee may, at its option, (a) terminate this contract on ninety (90) days notice in writing to the Licensor of its intention so to do, or (b) surrender its exclusive license granted by this contract and retain a non-exclusive right and license to continue the use of the patented inventions without the payment of any royalty therefor until such infringement ceases.

XVII.

The licensee shall have the following privileges and rights:

(a) At any time within two (2) years after the date of execution of this agreement, upon ninety (90) days' notice in writing to the Licensor of its intention so to do, to cancel this agreement; and

(b) To surrender this license at the end of two (2), four (4), six (6), eight (8), ten (10) years or any other period consisting of an even number of years after the date of execution hereof by giving to the licensor notice in writing of its desire and intention so to do at least ninety (90) days prior to the date the license is to be terminated; but any such termination of this license as in this article specified shall not release the licensee or the licensor, from any obligations theretofore accruing to the opposite party.

XVIII.

The licensee shall use reasonable diligence in manufacturing and/or marketing pistons embodying inventions licensed hereunder, and, in the event that, during the continuance of this agreement, it should not do so, the licensor shall have the following rights, options and privileges exercisable by it forthwith upon the finding by arbitration as hereinafter provided that the licensee has not used and is not using such diligence;

(a) To cancel or terminate this agreement by giving six (6) months' notice in writing to the said licensee of its desire and intentions so to do; whereupon at the expiration of said six (6) months from the date of said notice this agreement shall be terminated.

(b) To grant an additional license or licensee under the inventions or improvements, applications for letters patent and letters patents, or any of them, then embraced by and included within the terms of this license.

XIX.

Should the licensee, taking advantage of its privilege under any of the provisions of this contract, elect to terminate this contract and stand out from under the same, the licensee shall not be estopped to deny the validity of any of the patents covered or comprehended by this contract and shall not be deprived of any of the defenses or the rights of a defendant in an ordinary patent infringement suit, but, on the contrary, shall stand in the position of one who had never entered into this contract.

XX.

In the event either party hereto calls for an arbitration as provided for in this contract, each party shall select an arbitrator and the two arbitrators shall select a third arbitrator. In the event that the two arbitrators fail to select a third or in the event either party fails to select its arbitrator, it is agreed that the third and/or second arbitrator may be selected by the district judge of the United States District Court, Northern District of Ohio, Eastern Division, who has then been longest in said office. The three arbitrators thus selected shall constitute the Board of Arbitration and the parties hereto shall submit their contentions to this Board of Arbitrators at a time and in a manner determined by the arbitrators. The decision of any two arbitrators shall be final and binding on the parties hereto. Each party shall bear the expense of its arbitrator and both shall bear the expense of the third arbitrator share and share alike.

XXI.

The licensor agrees that should it at any time during the life of this agreement grant licenses under the patents, now included or in the future included in this agreement, or under the substantial and material patents now included or to be included in this agreement, at lower rates than one cent ($.01) per piston as provided for herein, or otherwise upon more favorable terms than are provided for herein, then this agreement shall, on the request of the licensee, be modified to make its terms as favorable as these upon which any subsequent license may be granted.

XXII.

The licensee agrees to assign, or cause to be assigned, to the licensor all United States patents and applications for United States patents which it now owns or in the future during the life of this contract acquires or controls relating to pistons per se.*

XXIII.

This agreement, in the construction of which the laws of the State of Ohio shall govern, is made by the Licensor under title conveyed by or acquired under and subject to the terms, provisions and conditions of a certain Conveyance, Declaration of Trust and Agreement entered into as of the 7th day of March, 1922, by and between Louis P. Mooers and George B. Pitts and The Cleveland Trust Company, Trustee, the Licensor herein, a copy of which is on file at the principal office of said The Cleveland Trust Company in the City of Cleveland, and open to the inspection of the Licensee, and unless terminated as hereinbefore provided, shall terminate with the date of expiration of the last Letters Patent now or hereafter embraced in said Declaration of Trust and Agreement.

In Witness Whereof, the parties have caused this instrument to be executed in duplicate by their respec-

* Pistons per se means pistons whose patentability depends upon physical, structural characteristics of the piston and not upon the character of the material in the piston or the molds, machines or the processes by which the piston is made.

On this 26th day of April, 1924, personally appeared before me G. R. Gibbons, to be known to be, the Secretary of Aluminum Company of America, and acknowledged to me that he executed the foregoing instrument on behalf of the said company and for the uses and purposes therein set forth.

M. D. WEDNER,
Notary Public.

My commission expires March 21st, 1925.

EXHIBIT A.

LICENSE AGREEMENT

THIS AGREEMENT made this 23rd day of April, 1920, between THE CLEVELAND TRUST COMPANY, a corporation of the State of Ohio, hereinafter called the Licensor, and NORDYKE & MARMON COMPANY, a corporation of the State of Indiana, hereinafter called the Licensee.

WITNESSETH, that

WHEREAS, the Licensor owns and holds title to the following: (a) Letters Patent of the United States No. 1,092,870, patented April 14, 1914, to E. O. Spillman and L. P. Mooers, for Piston for Explosion Engines or Motors; (b) application for Letters Patent of the United States, Sr. No. 106,502 and 106,503, filed June 28, 1916, by Louis P. Mooers for Pistons for Internal Combustion Motors; and (c) also owns and has title to all claims for damages and profits arising out of past infringement by the Licensee of said Letters Patent, and

WHEREAS, the Licensee is desirous of acquiring a license under said Letters Patent and those which may be granted upon the aforesaid applications for Letters Patent:

NOW, THEREFORE, for and in consideration of the premises, of the covenants and agreements of the parties hereto, respectively, as hereinafter set forth, and in further consideration of the assignment of Letters Patent of the United States No. 1,293,846, dated February 11, 1919, to Licensor, by Howard C. Marmon, the parties hereto have covenanted and agreed, and do hereby covenant and agree with each other, as follows:

A. The Licensor, on its part, does hereby:

(1) Grant to the Licensee the right and license, not exclusive, to manufacture, have manufactured for it, assemble, and use in and sell for use in Licensee's engines, mechanism and apparatus having and containing any or all of the inventions shown, described and claimed in the above recited Letters Patent and applications for Letters Patent and the Letters Patent of the United States which may be granted upon the latter, or either of them.

(2) Release and discharge the Licensee and all who have sold or used the product of the Licensee from any and all claims whatsoever for damages and profits arising by reason of infringement of said Letters Patent by Licensee's product.

B. It is understood and mutually agreed that:

(1) This license is not divisible and is not assignable by the Licensee excepting to a successor in business of the Licensee.

(2) This agreement is made by the Licensor subject to the terms, provisions and conditions of a certain Declaration of Trust and Agreement entered into, in writing, as of the date of August 4, 1917, by and between Louis P. Mooers and George B. Pitts, as Grantors, and The Cleveland Trust Company, *et al.*, as Trustee, including Article F-2 thereof, which reads:

"2. No debt or liability shall be incurred by the Trustee, either collectively or individually, except such as may be incidental to the management and development of said 'Property' and the Trustee shall have no power to bind the beneficiaries hereunder, or any of them personally; and in every written contract which the Trustee, or either of them, shall authorize, enter into or make, reference shall be made to this Declaration of Trust; and each person or corporation contracting with the Trustees, or either of them, shall look to the funds and 'Property' of the Trust for payment under such con-

tract or for the payment of any debt, judgment or decree, or of any money that may otherwise become due and payable; and neither of the Trustees, nor any beneficiary hereunder, shall be personally liable therefor."

A copy of which Agreement is on file at the principal office of said The Cleveland Trust Company in the City of Cleveland, Ohio, and open to inspection of the Licensee.

IN TESTIMONY WHEREOF, said parties have hereunto set their hands and seals by their respective officers hereunto duly authorized by said The Cleveland Trust Company and said Nordyke & Marmon Company, respectively, the execution being at the places and on the dates appearing under their respective names below.

THE CLEVELAND TRUST COMPANY,
By E. L. MASON,
Vice President.

Attest:
E. B. MERRELL,
A-Secretary.

Cleveland, Ohio,
Dated: May 6th, 1920.

NORDYKE & MARMON COMPANY,
By W. C. MARMON,
President.

Attest:
H. G. SHAFER,
Secretary.

Indianapolis, Indiana. Dated April 23rd, 1920.

STATE OF OHIO, COUNTY OF CUYAHOGA, ss:

On this 6th day of May, 1920, personally appeared before me E. L. Mason and E. B. Merrell to me known to be, respectively, the Vice-President and Asst. Secretary of The Cleveland Trust Company, of Cleveland, Ohio, and acknowledged to me that they executed the foregoing instrument on behalf of the said Company and for the uses and purposes therein set forth.

ROY F. HAGERTY,
Notary Public.

STATE OF INDIANA, COUNTY OF MARION, SS:

On this 23 day of April, 1920, personally appeared before me W. C. Marmon and H. G. Shafer, to me known to be, respectively, the ..... President and ..... Secretary of Nordyke & Marmon Company, of Indianapolis, Indiana, and acknowledged to me that they executed the foregoing instrument on behalf of the said company and for the uses and purposes therein set forth.

CHARLES W. REESE.

My commission expires Feb. 5, 1923.

PLAINTIFFS' EXHIBIT NO. 38c.

License Agreement between Walker M. Levett Co., W. M. Levett Corp., Walker M. Levett and The Cleveland Trust Company, dated April 11, 1924.

(Filed January 27, 1934.)

AGREEMENT

THIS AGREEMENT made and entered into this 11 day of April, 1924, by and between WALKER M. LEVETT COMPANY and W. M. LEVETT CORPORATION, both being corporations of the State of New York and WALKER M. LEVETT, of New York City, jointly and severally, (hereinafter referred to as parties of the first part) and THE CLEVELAND TRUST COMPANY, of Cleveland, Ohio, a corporation of the State of Ohio, (hereinafter referred to as the Trust Company).

WITNESSETH:

WHEREAS, the Parties of the First Part own the entire right, title and interest in and to applications for Letters Patent of the United States, Serial No. 470,502, filed May 18, 1921 of Gustav R. Kelm; and

WHEREAS, parties of the first part desire, under certain conditions, to dispose of their interest in and to the said application for patent and in any other patents or applications for Letters Patent relating to pistons per se* which they may own wholly or in part, or subsequently acquire, and

WHEREAS, the Trust Company desires to obtain the entire right, title and interest in and to the said application for letters patent and the entire right, title and interest possessed by the parties of the first part, and each of them, in and to any other patents or applications relating to pistons per se now owned or subsequently acquired by the parties of the first part together with certain rights to past infringements of the said patent or patents and application or applications.

Now, THEREFORE, in consideration of the covenants and agreements of the parties hereto, respectively as hereinafter set forth, said parties have covenanted and

---

* Pistons per se means pistons whose patentability depends upon physical, structural characteristics of the piston and not upon the character of the material in the piston or the molds, machines or the processes by which the piston is made.

agreed, and do hereby covenant and agree with each other as follows:

1. The Parties of the First Part agreed to sell, assign, transfer and set over to and hereby do sell, assign, transfer and set over to The Cleveland Trust Company as trustee under a certain conveyance, Declaration of Trust and Agreement dated March 7, 1922, copy of which is attached, marked "Exhibit A" * and another copy of which is on file with The Trust Company, the entire right, title and interest in and to said application for Letters Patent Serial No. 470,502 and the entire right, title and interest possessed by the Parties of the First Part, and each of them, in and to any Letters Patent or applications for Patent relating to pistons per se now owned, held, wholly or in part, on the date of the execution of this agreement or subsequently acquired; together with the right to sue and collect for all past infringements of the said patent or patents, or of any patent or patents issuing from such application or applications, and to collect damages and profits arising out of such infringement and apply the same to the benefit of The Cleveland Trust Company, as trustee.

2. The Parties of the First Part hereby agree for themselves, their respective executors and legal representatives, to execute and deliver to The Cleveland Trust Company, as trustee, any and all other papers or documents necessary or desirable more fully to convey to The Cleveland Trust Company, as trustee, the entire right, title and interest in and to the said applications, and Letters Patent when, and as, the same may be requested by The Cleveland Trust Company as trustee, and to do any and all further acts which may be desirable or necessary more effectually to secure to or vest in The Cleveland Trust Company, as trustee, its successors and assigns the entire right, title and interest in and to the said invention, Letters Patent and applications hereby sold, assigned and transferred or intended so to be.

3. The Parties of the First Part hereby agree for themselves, their respective executors and legal representatives, to assign to The Cleveland Trust Company, as Trustee, without further consideration the entire right,

---

*PRINTER'S NOTE:

The "Exhibit A" referred to above was not attached to Exhibit 38c.

title and interest in and to any United States Letters Patent or application relating to pistons per se which they may in the future acquire forthwith upon obtaining the same together with whatever rights they may acquire to sue and collect for past infringement thereof and to apply any damages and profits so recovered to the benefit of The Cleveland Trust Company as trustee.

4. In case the sub-license from the Aluminum Company of America to the parties of the first part, a copy of which is attached hereto, made a part hereof and marked "Exhibit B," * is canceled or terminated for any reason whatsoever, excepting the failure of parties of the first part reasonably to comply with their obligations thereunder, and said parties of the first part forthwith applied to whomsoever then holds or controls as owner or exclusive licensee, the inventions, applications for Letters Patent and Letters Patent embraced by such sub-license, for another sub-license upon terms at least as favorable for parties of the first part as those in said sub-license "B" contained, and such owner or exclusive licenses as the case might be, fails to execute or deliver to parties of the first part such a sub-license within thirty (30) days from the date of such application by said parties of the first part, then and in that event, this agreement shall be deemed and construed henceforth to operate as such a sub-license having the terms and conditions of the sub-license, Exhibit "B," applicable for such purpose and said parties of the first part shall account thereunder directly to The Trust Company.

5. This agreement, in the construction of which the laws of the State of Ohio shall govern, is made by The Trust Company under title conveyed by or acquired under and subject to the terms, provisions and conditions of said Conveyance, Declaration of Trust and Agreement of which "Exhibit A" is a copy.

---

*PRINTER'S NOTE:

The "Exhibit B" referred to above was not attached to Exhibit 38e.

PLAINTIFFS' EXHIBIT NO. 30d.

License Agreement between The National Piston Company, Gustave E. Franquist, James E. Diamond and The Cleveland Trust Company, dated April 11, 1924.

(Filed January 27, 1934.)

AGREEMENT.

THIS AGREEMENT made and entered into this 11th day of April, 1924, by and between THE NATIONAL PISTON COMPANY, INCORPORATED, a corporation of the State of New York, GUSTAVE E. FRANQUIST, of Rochester, N. Y. and JAMES E. DIAMOND, of Mount Vernon, N. Y. jointly and severally, (hereinafter referred to as Parties of the First Part) and THE CLEVELAND TRUST COMPANY of Cleveland, Ohio, a corporation of the State of Ohio, (Hereinafter referred to as the Trust Company).

WITNESSETH:

WHEREAS, the Parties of the First Part own the entire right, title and interest in and to United States Letters Patent, No. 1,153,902, issued September 21, 1915, to Gustave E. Franquist and,

WHEREAS, Parties of the First Part desire, under certain conditions, to dispose of their interest in and to the said patent and in any other patents or applications for Letters Patent relating to pistons per se* which they may own wholly or in part, or subsequently acquire, and

WHEREAS, The Trust Company desires to obtain the entire right, title and interest in and to the said patent to Franquist and the entire, right, title and interest possessed by the Parties of the First Part, and each of them, in and to any other patents or applications relating to pistons per se now owned or subsequently acquired by the parties of the First Part together with certain rights to past infringements of the said patent or patents and application or applications.

Now, THEREFORE, in consideration of the covenants and agreements of the parties hereto, respectively, as hereinafter set forth, said parties have covenanted and agreed, and do hereby covenant and agree with each other as follows:—

---

* Pistons per se means pistons whose patentability depends upon physical, structural characteristics of the piston and not upon the character of the material in the piston or the molds, machines or the processes by which the piston is made.

1. The Parties of the First Part agree to sell, assign, transfer and set over to and hereby do sell, assign, transfer and set over to The Cleveland Trust Company as trustee under certain Conveyance, Declaration of Trust and Agreement dated March 7, 1922, a copy of which is attached, marked "Exhibit A"* and another copy of which is on file with the Trust Company, the entire right, title and interest in and to United States Letters Patent No. 1,153,902, issued September 21, 1915, and the entire right, title and interest possessed by the Parties of the First Part, and each of them, in and to any Letters Patent or applications for Patent relating to pistons per se now owned, held, wholly or in part, on the date of execution of this agreement or subsequently acquired; together with the right to sue and collect for all past infringements of the said patent or patents, or of any patent or patents issuing from such application or applications, and to collect damages and profits arising out of such infringement and apply the same to the benefit of The Cleveland Trust Company as trustee; except that this assignment does not convey or intend to convey to The Trust Company the right to sue for and collect for past infringement of said Franquist patent by Walker M. Levett or The W. M. Levett Corporation, or the Walker M. Levett Company, of New York City.

2. The Trust Company hereby agrees forthwith upon the execution of this agreement to issue in the name of and transfer to the said Parties of the First Part, or their nominee or nominees, three hundred (300) shares in the beneficial interest created by said Conveyance, Declaration of Trust and Agreement, of which "Exhibit A" is a copy.

3. The Parties of the First Part hereby agree for themselves, their respective executors and legal representatives, to execute and deliver to The Cleveland Trust Company, as trustee, any and all other papers or documents necessary or desirable more fully to convey to The Cleveland Trust Company, as trustee, the entire right, title and interest in and to the said Letters Patent and applications, when, and as, the same may be requested by The Cleveland Trust Company, as trustee, and to do any and all further acts which may be desir-

---

*PRINTER'S NOTE:

The "Exhibit A," referred to above was not attached to Exhibit 38d.

able or necessary more effectually to secure to or vest in The Cleveland Trust Company, as trustee, its successors and assigns the entire right, title and interest in and to the said invention, Letters Patent and applications hereby sold, assigned and transferred or intended so to be.

4. The Parties of the First Part hereby agree for themselves, their respective executors and legal representatives, to assign to The Cleveland Trust Company, as trustee, without further consideration the entire right, title and interest in and to any United States Letters Patent or application relating to pistons per se which they may in the future acquire forthwith upon obtaining the same together with whatever rights they may acquire to sue and collect for past infringement thereof and to apply any damages and profits so recovered to the benefits of The Cleveland Trust Company, as Trustee.

5. In case the sub-license from the Aluminum Company of America to The National Piston Company, Incorporated, a copy of which is attached hereto, made a part hereof and marked "Exhibit B," * is cancelled or terminated for any reason whatsoever, excepting the failure of The National Piston Company, Incorporated, reasonably to comply with its obligations thereunder, and said The National Piston Company, Incorporated, forthwith applies to whomsoever then holds or controls as owner or exclusive licensee, the inventions, applications for Letters Patent and Letters Patent embraced by such sub-license, for another sub-license upon terms at least as favorable for The National Piston Company, Incorporated, as those in said sub-license "B" contained, and such owner or exclusive licensee as the case might be, fails to execute or deliver to The National Piston Company, Incorporated, such a sub-license within thirty (30) days from the date of such application by said The National Piston Company, incorporated, then and in that event, this agreement shall be deemed and construed henceforth to operate as such a sub-license having the terms and conditions of the sub-license, Exhibit "B," applicable for such purpose and The National Piston Company, Incorporated, shall account thereunder directly to The Trust Company.

---

*PRINTER'S NOTE:

The "Exhibit B" referred to above was not attached to Exhibit 38d.

6. This agreement, in the construction of which the laws of the State of Ohio shall govern, is made by the Trust Company under title conveyed by or acquired under and subject to the terms, provisions and conditions of said certain Conveyance, Declaration of Trust and Agreement, of which "Exhibit A" is a copy.

PLAINTIFFS' EXHIBIT NO. 38e.

License Agreement between Kant-Skore Piston Company and The Cleveland Trust Company, dated April 11, 1924.

(Filed January 27, 1934.)

Apr 11 1924

AGREEMENT

THIS AGREEMENT made and entered into this 11th day of ~~March~~ April, 1924, by and between THE KANT-SKORE PISTON COMPANY, an Ohio Corporation of Cincinnati, Ohio, (hereinafter sometimes referred to as Kant-Skore) and THE CLEVELAND TRUST COMPANY of Cleveland, Ohio, a corporation of the State of Ohio, (hereinafter referred to as The Trust Company)

WITNESSETH:

WHEREAS, Kant-Skore owns the entire right, title and interest in and to United States Letters Patent

Hater 1,485,078 February 26, 1924.

and an application for United States Letters Patent, Serial No. 588,473, filed in the name of Hater.

WHEREAS, Kant-Skore desires, under certain conditions, to dispose of their interest in and to the said patents and in any other patents or applications for Letters Patent relating to pistons per se* which they may own wholly or in part, or subsequently acquire, and

WHEREAS, The Trust Company desires to obtain the entire right, title and interest in and to the said patents and the entire right, title and interest possessed by Kant-Skore in and to any other patents or applications relating to pistons per se now owned or subsequently acquired by Kant-Skore together with certain rights to past infringements of the said patent or patents and application or applications.

NOW, THEREFORE, in consideration of the covenants and agreements of the parties hereto, respectively as

---

* Pistons per se means pistons whose patentability depends upon physical, structural characteristics of the piston and not upon the character of the material in the piston or the molds, machines or the processes by which the piston is made.

hereinafter set forth, said parties have covenanted and agreed, and do hereby covenant and agree with each other as follows:—

1. Kant-Skore agrees to sell, assign, transfer and set over to and hereby sells, assigns, transfers and sets over to The Cleveland Trust Company as trustee of a certain beneficial interest created by a certain Conveyance, Declaration of Trust and Agreement dated March 7th, 1922, copy of which is attached, marked "Exhibit A," * and another copy of which is on file with The Trust Company, the entire right, title and interest in and to United States Letters Patent, and applications enumerated above, and the entire right, title and interest possessed by Kant-Skore in and to any Letters Patent or applications for Letters Patent relating to pistons per se now owned, held, wholly or in part, on the date of the execution of this agreement or subsequently acquired; together with the right to sue for past infringements of the said patent or patents, or of any patent or patents issuing from such application or applications, and to collect damages and profits arising out of such infringement and apply the same to the benefit of The Cleveland Trust Company, as trustee. It is agreed that whatever right Kant-Skore now owns in or under the Spillman patent No. 1,325,176, December 16, 1919, is not transferred to The Trust Company by this agreement.

2. The Trust Company hereby agrees forthwith upon the execution of this agreement to issue in the name of and transfer to Kant-Skore fifty (50) shares in the beneficial interest created by and under said certain Conveyance, Declaration of Trust and Agreement, of which exhibit "A" is a copy.

3. Kant-Skore hereby agrees for itself, successors and its legal representatives to execute and deliver to The Cleveland Trust Company as Trustee any and all other papers or documents necessary or desirable more fully to convey to The Cleveland Trust Company, as Trustee, the entire right, title and interest in and to the said inventions, Letters Patent and applications and each of them hereby sold, assigned and transferred or intended so to be when, and as, the same may be requested

---

*PRINTER'S NOTE:

The "Exhibit A" referred to above was not attached to Exhibit 38e.

by The Trust Company, as Trustee, its successors and assigns.

4. Kant-Skore hereby agrees to assign to The Cleveland Trust Company, as Trustee, without further consideration, the entire right, title and interest in and to any United States Letters Patent or application relating to pistons per se which it may in the future acquire forthwith upon obtaining the same together with whatever rights they may acquire to sue and collect for past infringement thereof and to apply any damages and profits so recovered to the benefit of The Cleveland Trust Company as trustee.

5. In case the sub-license from the Aluminum Company of America to the Kant-Skore Company, a copy of which is attached hereto, made a part hereof, and marked "Exhibit B," * is cancelled or terminated for any reason whatsoever, excepting the failure of Kant-Skore Company reasonably to comply with its obligations thereunder, and said Kant-Skore Company forthwith applies to whomsoever then holds or controls as owner or exclusive licensee, the inventions, applications for Letters Patent and Letters Patent embraced by such sub-license, for another sub-license upon terms at least as favorable for Kant-Skore Company as those in said sub-license "B" contained, and such owner or exclusive licensee as the case might be, fails to execute or deliver to Kant-Skore Company such a sub-license within thirty (30) days from the date of such application by said Kant-Skore Company, then and in that event, this agreement shall be deemed and construed henceforth to operate as such a sub-license having the terms and conditions of the sub-license, Exhibit "B," applicable for such purpose and Kant-Skore Company shall account thereunder directly to The Trust Company.

6. This agreement, in the construction of which the laws of the State of Ohio shall govern, is made by The Trust Company under title conveyed by or acquired under and subject to the terms, provisions and conditions of said certain Conveyance, Declaration of Trust and Agreement, of which exhibit "A" is a copy.

---

*PRINTER'S NOTE:

The "Exhibit B" referred to above was not attached to Exhibit 38e.

PLAINTIFFS' EXHIBIT NO. 39a.

Letter from Aluminum Company of America to The Cleveland Trust Company, dated September 19, 1927.

(Filed January 27, 1934.)

Cleveland, Ohio, September 19, 1927.

The Cleveland Trust Company,
Trustee under Declaration of Trust and Agreement between L. P. Mooers et al., dated March 7, 1922,
Cleveland, Ohio.

Gentlemen:

We hereby consent to your executing and carrying out the agreement dated October 12th, 1927, between The Cleveland Trust Company, Trustee, and Bohn Aluminum & Brass Corporation, which has been initialled by Mr. W. P. King, and the license agreement dated as of Oct. 12th as of Sept. 15th, 1927, between The Cleveland Trust Company, Trustee, as Licensor and Bohn Aluminum & Brass Corporation as Licensee, which has also been initialled by Mr. W. P. King,—it being understood that said license agreement is to be carried out according to the terms thereof and is not to be changed or modified without our consent; and provided that either the agreements between The Cleveland Trust Company and Walker M. Levett Company, et al., and The National Piston Company et al., respectively, each dated April 11, 1924, shall be surrendered and cancelled, or all rights under paragraph four of the former agreement and paragraph five of the latter agreement be waived and extinguished.

This letter of consent or authority to execute shall continue unless extended for a further period at that time, until thirty days from date hereof.

Very truly yours,

ALUMINUM COMPANY OF AMERICA,
By W. P. KING,
Vice-President.

PLAINTIFFS' EXHIBIT NO. 39b.

Letter from Aluminum Company of America to The Cleveland Trust Company, dated October 12, 1927.

(Filed January 27, 1934.)

Detroit, Mich., October 12, 1927.

The Cleveland Trust Company,
Trustee under Declaration of Trust and Agreement between L. P. Mooers et al., dated March 7, 1922.
Cleveland, Ohio.

Gentlemen:

Supplementing our letter of September 19, 1927 to you, we beg to say that it is understood and we hereby agree, that in case we surrender the license heretofore granted to us by you under date of April 26, 1924, any re-assignment of the patents, patent applications or other patent rights which have been assigned by us to you under said license agreement, shall be made subject to the license granted by you to the Bohn Aluminum & Brass Corporation by the agreement ~~dated~~ executed this day ~~1927~~ between you and the Bohn Aluminum & Brass Corporation, the execution of which on your part we consented to in our letter of September 19th, 1927.

Very truly,

ALUMINUM COMPANY OF AMERICA,
By W. P. KING,
Vice President.

PLAINTIFFS' EXHIBIT NO. 39c.

License Agreement between The Cleveland Trust Company and Bohn Aluminum & Brass Corporation, dated September 15, 1927, with Lists A and B Attached.

(Filed January 27, 1934.)

LICENSE AGREEMENT

This License Agreement, made and entered into by and between THE CLEVELAND TRUST COMPANY, of Cleveland, Ohio, as Trustee under the Declaration of Trust and Agreement between L. P. Mooers et al. and The Cleveland Trust Company, dated March 7, 1922, hereinafter sometimes called the Licensor, and BOHN ALUMINUM & BRASS CORPORATION, a Michigan corporation of Detroit, Michigan, hereinafter sometimes called the Licensee, witnesseth:—

WHEREAS the Licensor owns the entire right, title and interest in and to the Letters Patent and applications for Letters Patent in the United States as set forth in List A, attached hereto, and has arranged to acquire the entire right, title and interest in and to the Letters Patent and applications set forth in List B, attached hereto; and

WHEREAS the Licensor may acquire other United States patents, patent applications and patent rights relating to pistons per se* during the life of this agreement; and

WHEREAS the said Licensee is desirous of acquiring a license to make, use and sell the inventions included in the said patents and applications acquired and to be acquired by the Licensor for the full term for which said patents are or shall be granted;

NOW, THEREFORE, in consideration of the premises and of the covenants and agreements of the parties hereto, respectively, as hereinafter set forth, said parties have covenanted and agreed, and do hereby covenant and agree with each other as follows:

---

* Pistons per se means pistons whose patentability depends upon physical, structural characteristics of the piston and not upon the character of the material in the piston or the molds, machines or the processes by which the piston is made.

Amended—January 1, 1928

I

The Licensor grants the Licensee the non-exclusive right to make, use and sell a maximum of five million (5,000,000) pistons and/or piston castings per accounting year (each year beginning July 1st) embodying any of the inventions covered by any of the patents and applications in the above named lists, being all of the patents and applications for patents relating to pistons per se now owned by the Licensor, or to be covered by any continuations and divisions, renewals or reissues of the same, for the full term of each of said patents throughout the United States, the territories and possessions thereof. In case the Licensee makes and sells no so-called controlled type* pistons or castings which are, after sale, modified or to be modified into controlled type pistons, during any accounting year, the maximum of five million pistons and/or piston castings provided herein for that year is waived and the number of pistons and/or piston castings the licensee may make hereunder for that year is unlimited. This license and agreement will be automatically extended to cover any other and further patents or applications or other rights under patents which the Licensor may acquire relating to pistons per se, subject to the conditions imposed thereon when received by the Licensor, unless excluded therefrom by the Licensee as hereinafter provided, and the Licensor agrees to execute any further instruments and perform any further acts if any are required, to consummate the granting of such licenses to the Licensee.

II

The Licensor releases and discharges the Licensee, all its vendees and/or users of pistons, the castings for which were heretofore acquired from the Licensee, from any and all claims whatsoever for damages or profits by reason of any alleged past infringement of any of the patents in lists A and B hereto attached now owned by the Licensor and arising out of the manufacture, use and

---

*By controlled type of aluminum piston is meant any piston made in any part of a light metal or of an alloy of a specific gravity less than iron or steel, the expansion and contraction of which is controlled to any extent by any other metal with a coefficient of expansion different from that of the said light metal or alloy.

sale of such pistons; and from any claim or claims for past damages or profits under patents which shall be acquired by the Licensor in the future, during the continuance of this agreement, and under which the Licensee shall accept a license hereunder, and theretofore arising out of the manufacture, use and sale of such pistons; and agrees not to institute or to aid or abet the institution of any suit against the Licensee, or the vendees or users of pistons, the castings for which were heretofore acquired from the Licensee, for any alleged past infringement of any patents relating to the subjects covered by the patents or applications named herein or for damages and profits because of alleged past infringement thereof and heretofore arising out of the manufacture, use and sale of such pistons.

III

1. (a) The Licensor shall institute and prosecute to a conclusion with due diligence suit or suits against any or all infringers of the patents included within the terms of this agreement necessary reasonably to protect the interests of the Licensee acquired hereunder, provided that the Licensor be indemnified to its satisfaction by the Licensee for any costs or expenses which the Licensor may suffer or sustain in connection with or growing out of any such suit.

(b) The Licensor shall defend any suit or suits, so far as such defense shall be necessary reasonably to protect the interests of the Licensee acquired hereunder, brought because of the alleged infringement of any Letters Patent covering the design of pistons made, sold or used under this agreement and for which royalties are paid under this agreement, provided that the Licensor be indemnified to its satisfaction by the Licensee for any costs or expenses which the Licensor may suffer or sustain in connection with or growing out of any such defense.

2. Should the Licensor bring and prosecute or defend as above provided such infringement suit or suits at its own expense, all profits or damages recovered in said suit or suits shall be the absolute property of the Licensor.

3. In the event of the failure of the Licensor promptly to institute and vigorously prosecute or to defend such suit or suits as may be necessary reasonably to protect the interests of the Licensee hereunder, then and in that event, the Licensee having reasonably in-

demnified the Licensor, may in the name of the Licensor or the names of the Licensor and Licensee jointly institute or adopt and diligently prosecute or defend at the Licensee's expense such suit or suits as may be required reasonably to protect its interests. The Licensor at any time shall have the right to join in the prosecution or defense of such suit or suits with its own counsel and at its own expense.

4. Should the Licensee bring or prosecute or defend as above provided any such infringement suit or suits or should the Licensee furnish indemnification to the Licensor in connection with suits brought or prosecuted or defended by the Licensor and pay any sum on account of such indemnification, it shall have the right to apply all royalties payable by it on the reasonable costs and expenses of such suit or suits, including attorney's fees, or on said sum paid on account of indemnification and shall apply the sum, if any, recovered in any such suit, first, to the reimbursement of it for said reasonable expenses and costs, including attorney's fees, or sums paid on account of indemnification, and not theretofore reimbursed to it out of royalties, and second, to the payment to the Licensor of all sums theretofore deducted by the Licensee from royalties and applied to the said reasonable costs and expenses, including attorney's fees, of such suit or payments of indemnification, and the balance shall be the absolute property of the Licensee.

IV

The Licensee agrees that it will within the months of January, April, July and October of each year from and after the execution hereof, furnish to the Licensor, its successors or assigns in interest, a written statement under oath which shall show:—

(a) the number of pistons and piston castings made by or for it or imported by it, and used, sold* or otherwise disposed of by it during the preceding three calendar months, which contain or which to the Licensee's knowledge are to be modified or fabricated by the Licensee's vendees to contain and embody any invention covered by any of the claims of any of the Letters Patent and applications recited in Lists A and B hereto attached, or in the future acquired by the Licensor and included herein.

---

*Sold in this contract means and includes only licensed pistons which are delivered during the period.

This report shall be made whether or not the Licensee makes, uses or sells any pistons and/or castings therefor during the preceding royalty period.

(b) the number of controlled type pistons and castings for controlled type pistons made by or for it or imported by it, and used, sold or otherwise disposed of by it during the preceding three calendar months.

This report shall be made whether or not the Licensee makes, uses or sells any controlled type pistons and/or castings therefor during the preceding royalty period.

(c) the number of such pistons and piston castings sold by the Licensee and for which the vendee has been subsequently credited.

The first report shall include the pistons and/or piston castings covered by this Article, used, sold or otherwise disposed of between ~~the date of this contract~~ September fifteenth and October 1, 1927.

Alteration (OK)
B. A. & B. Corpn. PAM
The C. T. Co.—AJP
A. Co. of Am.—WPK

V

The Licensee will pay the Licensor a royalty of one cent (1¢) upon each piston used, sold or otherwise disposed of by the Licensee during the life of this agreement, embodying in its construction any invention covered by one or more of the claims of the Letters Patent and applications named in Lists A and B attached hereto, or in the future acquired by the Licensor and added hereto, and upon each piston casting sold or otherwise disposed of by the Licensee with the intention or the knowledge of the Licensee that it shall be modified or fabricated by the Licensee's vendee in such way as to embody in its construction any invention covered by one or more of the claims in the said Letters Patent or applications.

It is understood that no royalties will be payable or collectible upon the licensed pistons or piston castings which have been sold and for which the vendee thereof has been subsequently credited, and that if any royalties have been paid upon the licensed pistons or piston cast-

ings which are sold, and for which the vendee has been subsequently credited, the Licensee shall have credit therefor upon the next due payment.

VI

For the purpose of the interpretation of the provisions of this agreement, it is agreed that the commercial controlled type pistons heretofore manufactured, or for which castings have heretofore been manufactured, by Bohn Corporation and Aluminum Company of America, are covered by claims of the patents included in Lists A and B hereto attached.

VII

Within thirty (30) days after it shall have furnished, in January, April, July and October of each year, the statements specified in Article IV hereof, the Licensee shall and will pay to the Licensor, its successors or the assigns of its interest in said Letters Patent, the royalties upon the pistons and piston castings covered by said reports, at the rate prescribed.

VIII

The Licensee agrees that it will keep accurate books of account, giving full particulars of the Licensee's business with respect to the licensed pistons and piston castings covered by this agreement and will admit the Licensor or its duly accredited agent at all reasonable times to inspect the same.

IX

In the event that the combination set forth in any of the claims of the Letters Patent shown in Lists A and B hereto attached or of the applications for Letters Patent shown in said lists A and B and of the Letters Patent to be granted on said applications, and/or acquired in the future and added hereto, is held by a court of final jurisdiction or by an inferior court from whose decree no appeal is taken or the appeal is denied or dismissed, to be an infringement of any other patent (other than patents owned by the Licensee or under which the Licensee is licensed) in any patent suit brought in the United States against the Licensor, the Licensee, any other of the Licensor's licensees, any sub-licensees or any of its or their vendees, the Licensee shall have, and is hereby given, the right and option to exclude from this license

any such claim or claims or the Letters Patent or applications for Letters Patent containing such claim or claims, as the case may be, and to have the royalty payable hereunder reduced proportionately to the reduction, if any, caused by such judicial holdings, in the value of the patents and applications comprehended by this agreement, such proportion to be determined by arbitration as hereinafter in Paragraph XVIII hereof provided, or to terminate this agreement altogether, by giving to the Licensor notice in writing of its election so to do within six (6) months from the rendition of the judicial holding of the court of final jurisdiction or after the expiration of the time for appeal or after the appeal has been denied or dismissed.

X

This agreement and license shall be transferable only to the successors or assigns of the entire casting business of the Licensee or the entire business of either of the parties hereto, but in that event the successors or assigns shall be bound by the provisions of this agreement and obligated to conform thereto; provided, however, that any successor to The Cleveland Trust Company, as Trustee under said Declaration of Trust and Agreement, dated March 7, 1922, shall be deemed, for the purposes hereof, to be the successor and assign of the entire business of the Licensor.

XI

The Licensee will not during the life of this agreement contest, or aid others in contesting, the scope or validity of any of the Letters Patent included within this agreement or afterwards acquired by the Licensor and included in this agreement.

XII

The Licensee hereby is given the right and option to exclude from this license any Letters Patent or applications for Letters Patent or other patent rights which the Licensor may acquire after the execution of this license, provided the Licensee gives the Licensor notice in writing of such exclusion within ninety (90) days after notice in writing to the Licensee by the Licensor of the acquisition of such Letters Patent or applications or other patent rights.

XIII

The Licensee shall pay royalties only upon pistons and piston castings delivered during the term of this license.

XIV

If either of the parties hereto neglects or refuses to keep any of its covenants herein, then the other party hereto may serve on the derelict party by registered mail a notice in writing of such default and if the derelict party shall continue such default for thirty (30) days after the serving of such notice, then the aggrieved party may at its option cancel this license by a notice in writing of such cancellation and termination, provided, however, that the foregoing remedy shall not exclude any other remedy which the aggrieved party may have at law or in equity. The waiver of any breach by either party shall not be interpreted as constituting a waiver of any further breach or breaches.

XV

The Licensor hereby grants to the Licensee the right to make, use and sell in the United States pistons embodying the inventions covered by any foreign patents or applications for foreign patents, which the Licensor now owns or controls, or in the future acquires, for sale and use in foreign countries covered by said patents and/or applications. The Licensor releases the Licensee, its vendees and all users of its pistons, from any claim or claims for alleged infringement of foreign patents, which the Licensor now has or in the future may acquire and under which the Licensee may accept a license as herein provided. The Licensor agrees, upon demand of the Licensee, to execute all instruments and perform all acts necessary to grant the licenses under this paragraph. This license and agreement will be automatically extended to cover pistons under any other and further foreign patents or applications for foreign patents or other rights under foreign patents on pistons per se which the Licensor may acquire in the future, unless excluded therefrom by the Licensee as provided for in this contract and the Licensor agrees to execute any further instruments and perform any further acts, if any are required, to consummate the granting of licenses to the Licensee under this section of this agreement.

XVI

The Licensee shall use reasonable diligence in manufacturing and/or marketing pistons embodying inventions, licensed hereunder, and, in the event that, during the continuance of this agreement, it should not do so, the Licensor shall have the following right, option and privilege exercisable by it forthwith upon the finding by arbitration as hereinafter provided that the Licensee has not used and is not using such diligence:

(a) To cancel or terminate this agreement by giving six (6) months' notice in writing to the said Licensee of its desire and intentions so to do; whereupon at the expiration of said six (6) months from the date of said notice this agreement shall be terminated.

XVII

Should the Licensee, taking advantage of its privilege under any of the provisions of this contract, elect to terminate this contract and stand out from under the same, the Licensee shall not be estopped to deny the validity of any of the patents covered or comprehended by this contract and shall not be deprived of any of the defenses or the rights of a defendant in an ordinary patent infringement suit, but, on the contrary, shall stand in the position of one who had never entered into this contract.

XVIII

In the event either party hereto calls for an arbitration as provided for in this contract, each party shall select an arbitrator and the two arbitrators shall select a third arbitrator. In the event that the two arbitrators fail to select a third or in the event either party fails to select its arbitrator, it is agreed that the third and/or second arbitrator may be selected by the district judge of the United States District Court, Northern District of Ohio, Eastern Division, who has then been longest in said office. The three arbitrators thus selected shall constitute the Board of Arbitration and the parties hereto shall submit their contentions to this Board of Arbitration at a time and in a manner determined by the arbitrators. The decision of any two arbitrators shall be final and binding on the parties hereto. Each party shall bear the expense of its arbitrator and both shall bear the expense of the third arbitrator share and share alike.

XIX

The Licensor agrees that should it at any time during the life of this agreement grant licenses under the patents, now included, or in the future included, in this agreement, or under the substantial and material patents now included or to be included in this agreement, at lower rates than one cent ($.01) per piston as provided for herein, or otherwise upon more favorable terms than are provided for herein, then, upon request of Licensee, this agreement shall be modified to make its terms as favorable as those upon which any such subsequent license may be granted.

XX

Amended—January 1, 1928

Except as otherwise provided in Article I hereof, this licensee is limited to five million (5,000,000) pistons and piston castings (together) per accounting year. If the Licensee exceeds that amount in any accounting year without the written consent of the Licensor, and of the Licensor's other licensee (being the exclusive licensee except for this license) under the patents held in the Licensor's trust estate, then the Licensor shall charge and collect an additional royalty of ten cents (10¢) per piston for all pistons and piston castings in excess of the maximum five million (5,000,000), which additional royalty shall be paid by the Licensee to the Licensor on demand, and the Licensor shall diligently proceed by proper proceedings to enjoin and prevent any further such violation of the provisions of this license, or, failing so to enjoin and prevent such violation, the Licensor shall cancel this license.

XXI

This agreement is made by the Licensor under title conveyed by or acquired under and subject to the terms, provisions and conditions of a certain Conveyance, Declaration of Trust and Agreement entered into as of the 7th day of March, 1922, by and between Louis P. Mocers and George B. Pitts and The Cleveland Trust Company, Trustee, the Licensor herein, a copy of which is on file at the principal office of said The Cleveland Trust Company in the City of Cleveland, and open to the inspection of the Licensee, and unless terminated as hereinbefore provided, shall terminate with the date of expiration of the last Letters Patent now or hereafter embraced in said Declaration of Trust and Agreement.

XXII

Upon the execution and delivery hereof, Bohn Corporation shall surrender and cancel all of the Sub-licenses under the patents held by the Trust Company which said Bohn Corporation or any of its subsidiary or affiliated companies own.

XXIII

The non-exclusive license granted by this agreement does not convey to the Licensee any rights to grant any sub-licenses thereunder.

IN WITNESS WHEREOF, the parties hereto have caused this instrument to be executed in duplicate by their respective officers thereunto duly authorized October 12, 1923 as of the 15th day of September, A. D. 1927.

PLAINTIFFS' EXHIBIT NO. 39d.

Letter from Aluminum Company of America to The Cleveland Trust Company, dated September 19, 1927.

(Filed January 27, 1934.)

ALUMINUM COMPANY OF AMERICA

Warren P. King
Vice-President

Cleveland, O., September 19, 1927.

The Cleveland Trust Company, Trustee
under Declaration of Trust between
L. P. Mooers et al., dated March 7,
1922,
Cleveland, Ohio.

Gentlemen:

We beg to advise that we recognize that the commercial controlled type pistons heretofore manufactured, or for which castings have heretofore been manufactured, by us, are covered by claims of one or more of the patents included in lists A and/or B attached hereto.

Very truly yours,

ALUMINUM COMPANY OF AMERICA,
By W. P. KING,
Vice-President.

(Defendants' Exhibit 4-U.)

License Agreement between The Cleveland Trust Company and Bohn Aluminum & Brass Corporation.

(Filed January 27, 1934.)

LICENSE AGREEMENT

THE CLEVELAND TRUST COMPANY

TO

BOHN ALUMINUM AND BRASS CORPORATION

October 12, 1927

Amended—Jan. 1, 1928

Amended—Dec. 24-1929

THIS AGREEMENT, made and entered into as of on the 25th day of April, 1928, as of the first day of January 1928 by and between THE CLEVELAND TRUST COMPANY, of Cleveland, Ohio, as Trustee under the Declaration of Trust and Agreement between L. P. Mooers *et al.* and The Cleveland Trust Company, dated March 7, 1922, hereinafter sometimes called the "Licensor," and BOHN ALUMINUM AND BRASS CORPORATION, a Michigan corporation, of Detroit, Michigan, hereinafter sometimes called the "Licensee,"

WITNESSETH:

WHEREAS said The Cleveland Trust Company, as Trustee as aforesaid, and the Bohn Aluminum and Brass Corporation heretofore entered into a certain License Agreement, executed on the 12th day of October, 1927, as of the 15th day of September, 1927, wherein said Trust Company, as said Trustee, is Licensor and the Bohn Aluminum and Brass Corporation is Licensee; and

WHEREAS the parties thereto desire to modify and amend said License Agreement as hereinafter provided;

NOW, THEREFORE, it is agreed by and between the parties hereto,—each party hereto making its promises and agreements herein contained in consideration of the promises and agreements of the other party herein contained,—as follows, to wit:

1. The first two sentences of Article I of the said License Agreement, executed October 12, 1927, as of September 15, 1927, are hereby modified and amended so as to read as follows:

The Licensor grants the Licensee the non-exclusive right to make, use and sell a maximum of ten million (10,000,000) pistons and/or piston castings per accounting year (each year beginning January 1st) embodying any of the inventions covered by any of the patents and applications in the above named lists, being all of the patents and applications for patents relating to pistons per se now owned by the Licensor, or to be covered by any continuations and divisions, renewals or reissues of the same, for the full term of each of said patents throughout the United States, the territories and possessions thereof. In case the Licensee makes and sells no so-called controlled type* pistons or castings which are, after sale, modified or to be modified into controlled type pistons, during any accounting year, the maximum of ten million pistons and/or piston castings provided herein for that year is waived and the number of pistons and/or piston castings the licensee may make hereunder for that year is unlimited.

2. Article XX of the said License Agreement, executed October 12, 1927, as of September 15, 1927, is hereby modified and amended so as to read as follows:

Except as otherwise provided in Article I hereof, this license is limited to ten million (10,000,000) pistons and piston castings (together) per accounting year. If the Licensee exceeds that amount in any accounting year without the written consent of the Licensor, and of the Licensor's other licensee (being the exclusive licensee except for this license) under the patents held in the Licensor's trust estate, then the Licensor shall charge and collect an additional royalty of ten cents (10¢) per piston for all pistons and piston castings in excess of the maximum ten million (10,000,000), which additional royalty shall be paid by the Licensee to the Licensor on demand, and the Licensor shall diligently proceed by proper proceedings to enjoin and prevent any further such violation of the provisions of this license, or, failing

*By controlled type of aluminum piston is meant any piston made in any part of a light metal or of an alloy of a specific gravity less than iron or steel, the expansion and contraction of which is controlled to any extent by any other metal with a coefficient of expansion different from that of the said light metal or alloy.

so to enjoin and prevent such violation, the Licensor shall cancel this license.

3. Except as hereinabove otherwise specifically provided, the said agreement executed October 12, 1927, as of September 15, 1927, shall remain unchanged and in full force and effect.

IN WITNESS WHEREOF, the parties hereto have caused this instrument to be executed in duplicate by their respective officers thereunto duly authorized as of the day and year first above written.

PLAINTIFFS' EXHIBIT NO. 39g.

Letter from Aluminum Company of America to The Cleveland Trust Company, dated December 24, 1929.

(Filed January 27, 1934.)

Cleveland, Ohio, December 24, 1929.

The Cleveland Trust Company, Trustee
under Declaration of Trust and Agreement between L. P. Mooers *et al.*,
dated March 7, 1922,
Cleveland, Ohio.

Gentlemen:

We hereby consent to your licensing Bohn Aluminum & Brass Corporation to make, use and sell a maximum of Eleven Million (11,000,000) pistons and/or piston castings during the accounting year beginning January 1, 1929, and ending December 31, 1929, under the License Agreement dated September 15, 1927, and actually executed October 12, 1927, between you as Licensor and Bohn Aluminum and Brass Corporation as Licensee, as amended by Agreement made on April 25, 1928, as of January 1, 1928, (being One Million (1,000,000) pistons and/or piston castings more than provided in said Agreement as so amended) it being understood that all other terms and provisions of said License Agreement as amended on April 25, 1928, shall be and remain in full force and effect and that the said One Million (1,000,000) increase in the number of licensed pistons and/or piston castings applies to said accounting year 1929 only, and that the maximum number of licensed pistons and/or piston castings for each accounting year subsequent to the said accounting year 1929 shall be Ten Million (10,000,000), and that the said license Agreement executed on October 12, 1927, as of September 15, 1927, between you as Licensor and Bohn Aluminum & Brass Corporation as Licensee, as amended by the said Agreement made April 25, 1928, as of January 1, 1928, except as to the said increase of One Million (1,000,000) in the number of pistons and/or piston castings licensed for the year 1929, is to be carried out according to the terms thereof and is not to be further changed or modified without our consent.

Very truly yours,

ALUMINUM COMPANY OF AMERICA,

By W. P. KING,

Vice-President.

PLAINTIFFS' EXHIBIT NO. 40.

Agreement between Bohn Aluminum & Brass Corporation and The Cleveland Trust Company, dated October 12, 1927, Under Schmiedeknecht Patent No. 1,256,265.

[Offered also as Defendants' Exhibit 4-V.]

(Filed September 27, 1934.)

AGREEMENT

THIS AGREEMENT made and entered into this 12th day of October, 1927, by and between the BOHN ALUMINUM & BRASS CORPORATION, a Michigan corporation, of Detroit, Michigan, hereinafter sometimes called the "Bohn Corporation," and THE CLEVELAND TRUST COMPANY, an Ohio corporation, of Cleveland, Ohio, as Trustee under the Declaration of Trust and Agreement between L. P. Mooers et al., dated March 7, 1922, hereinafter sometimes called the "Trust Company,"

WITNESSETH:

WHEREAS the Bohn Aluminum & Brass Corporation owns the entire right, title and interest in and to United States Letters Patent No. 1,256,265, issued to Victor E. Schmiedeknecht on February 12, 1918, and an application for United States Letters Patent, Serial No. 201650, filed in the name of Frank J. Kent, both of which are for certain inventions relating to pistons per se*; and

WHEREAS the Bohn Corporation is a large manufacturer of aluminum pistons; and

WHEREAS the Trust Company, as Trustee as aforesaid, owns various patents relating to pistons per se; and

WHEREAS the Trust Company, as Trustee as aforesaid, desires to obtain the patent and the application for patent above named and to have the said Bohn Corporation accept a license under the patents in said trust estate, relating to pistons per se, by the terms of which said Bohn Corporation recognizes said patents and agrees to pay one cent (1¢) per piston royalty upon the pistons and/or castings therefor, made, used and/or sold by it, which are covered by said patents, or any of them; and

---

* Pistons per se means pistons whose patentability depends upon physical, structural characteristics of the piston and not upon the character of the material in the piston or the molds, machines or the processes by which the piston is made.

WHEREAS said Bohn Corporation is willing to sell and assign to said Trust Company, as Trustee as aforesaid, the patent and the application for patent above named and to accept a license from said Trust Company upon the terms and conditions hereinafter provided for;

NOW, THEREFORE, it is agreed by and between the parties hereto, each party hereto making its promises and agreements herein contained in consideration of the promises and agreements of the other party herein contained —each of said promises and undertakings being material and dependent—as follows, to wit:

1. Said Bohn Corporation agrees to sell, assign, transfer and set over and hereby sells, assigns, transfers and sets over to The Cleveland Trust Company, as Trustee under the Declaration of Trust and Agreement between L. P. Mooers et al., dated March 7, 1922, the entire right, title and interest in and to the United States Letters Patent No. 1,256,265 and in and to the application for United States Letters Patent, Serial No. 201650, named above, together with the right to sue for past infringements of the said patent or of any patent issuing from such application, and to collect damages and profits arising out of such infringement and apply the same to the benefit of The Cleveland Trust Company, as Trustee.

2. The Trust Company hereby agrees forthwith upon the execution of this agreement to issue and deliver to said Bohn Corporation or its nominees or assigns, fully paid, One Thousand Five Hundred and Twelve and One-half (1512½) shares of the piston patent estate created by the said Trust Agreement dated March 7, 1922, between the Trust Company and L. P. Mooers et al., there being issued and outstanding at the date of the execution of this agreement Three Thousand (3000) of such shares, exclusive of the One Thousand Five Hundred and Twelve and One-half (1512½) shares so to be issued to said Bohn Corporation or its nominees or assigns.

3. Said Trust Company and said Bohn Corporation agree, forthwith upon the execution hereof, to execute the license agreement, a copy of which is hereto attached.

IN WITNESS WHEREOF, the parties hereto have set their hands and seals to duplicates hereof the day and year first above written:

BOHN ALUMINUM & BRASS CORPORATION,
By P. A. MARKEY,
Vice-President.

Attest: A. P. LAUER,
Secretary.

PLAINTIFFS' EXHIBIT NO. 42a.

Franklin Weekly Engineering Report, for the Week Ending October 5, 1918.

(Filed January 27, 1934)

MECHANICAL LABORATORY

ML4U—10000 Mile Wear Test

This engine has been built up again and the test has proceeded 8500 miles and will continue on to completion at intervals between our Government work when men are available for attendance.

ML20M—Piston Endurance Runs

Special Long patented aluminum composition pistons. Weight including wrist pin, 2 pressure proof jr. rings, and one Inland top ring—1.225#.

A full set of these pistons were installed in a regular series nine engine and fitted to the cylinders such that the straight skirt clearance from just below the wrist pin down was from .002" to .003". The lands were all .025" clearance just as they were received. It may be noted that there was four oil holes in the top of each wrist pin boss and also eight oil holes just below the lower ring. The engine, thus built up, was placed on dynamometer #2, fitted with tinware as in a car and the test was carried out according to the method described in ML20M so that results are comparable with those in that report.

In this last test the pistons were installed in such a way that the ribless side was toward the exhaust side of the engine.

Result; After 10 minutes running, pistons #4 and 6 seized on the exhaust (ribless) side of the piston.

This test will be repeated with the same style of pistons having a straight skirt clearance of .005" and having the ribless side of piston toward the suction side of the engine. To build up the motor in this way and not be obliged to cut away the rib in order to make room for the connecting rod cap screw, the connecting rods will be turned, through 180° and thus have their cap screw on the suction side.

LONG PATENT PISTON—PURCHASE ORDER #35509—TYPE "B."

250 of these from pattern X-13 are on order at Walker M. Levett Co. To date fourteen of these have been duly received. We are advised that shipment has been made of an additional fifty castings.

TYPE "A."

One hundred and sixty castings have been received of our original order calling for 350 castings from our type "A" pattern #P-2912. After receiving 65 castings we recalled pattern back from Walker-Levett Co. This to enable bringing pattern up to latest blue print. Upon completion same will be returned them for the completion of our order.

SHIPMENTS.

6 Long patent pistons type "A" equipped with rings and wrist pins have been forwarded to our Detroit dealer, Mr. W. J. Doughty.

PLAINTIFFS' EXHIBIT NO. 42b.

Franklin Weekly Engineering Report, for the Week Ending July 20, 1918.

(Filed January 27, 1934.)

ML20N—PISTON ENDURANCE RUNS

A regular series nine engine was equipped as follows; (a) New production gauge cylinders, (b) #1 cylinder was equipped with Long patent piston with no rib on suction side, (c) other pistons were regular production magnalite having a clearance of .013" for a distance of 1⅛" below the bottom ring and then tapering off to .003" at the skirt.

The engine was then placed on dynamometer #1 and motored in for three hours at 1000 R.P.M. Jackets were installed and a piston endurance run was made under the conditions described in report ML20M.

The run proceeded for 19 minutes when the power failed, thus taking the load off the engine. The horsepower had not dropped sufficient to indicate a "set up."

After allowing the engine to cool off to room temperature a second trial was made and this time the run proceeded for 19 minutes when the motor set up suddenly. #1 special piston set up so tightly and there was a large hole in the top of the piston. Two of the other pistons seized slightly on the exhaust side near the skirt.

PLAINTIFFS' EXHIBIT NO. 42c.

Franklin Weekly Engineering Report for the Week Ending May 3, 1919.

(Filed January 27, 1934.)

MECHANICAL LABORATORY.

ML 4X 10000 MILE WEAR TEST.

The Long Patent pistons with floating wrist pins and straight .003" clearance did not show excessive wear but one piston broke at 75000 miles and the retaining buttons in wrist pin holes had all worked loose, wearing down both the button and the wrist pin hole. One button was broken and one had the horizontal retaining lugs entirely worn away.

The electric welded cylinder did not show any excessive wear nor evidence of failing where it had been welded. This sample was returned to Mr. Babcock.

Practically no carbon was found in spark plug holes where the threads had been undercut.

The valve lifters with same grinding area as S-5 were in good condition after a total of 15000 miles. Some of the lifters showed scarcely any wear from the action of the cams and none showed excessive wear on the lifting surface. Further work will be done along this line. See tables for wear on wrist pins and wrist pin holes in pistons and connecting rods.

Motor Cars

Mr. E. C. Long,
Hannibal, Mo.

Dear Sir,

Mr. Franklin has referred your letter of May 6 and preceding one to the writer.

We shall be glad to have you send us one of the sample pistons which you speak of. If more are needed we can arrange with you to supply them or we could have some made up here.

We shall await with considerable interest the arrival of this sample.

Very truly yours

H. H. FRANKLIN MANUFACTURING CO.

Distributors of
Franklin
Motor Cars

April 17, 1918.

Mr. E. C. Long,
Hannibal, Mo.

My dear Sir:

I have your letter of April 13 and note with interest that you have a patent piston which shows up well in test. My judgment is that you should arrange to have the piston tested in some laboratory. There are numerous places where you could have the test made, or we would make it for you. Before going ahead we would want full details of the piston or better still a sample of the piston itself. If the piston is all that you think you could put it on the market or you could license its use by manufacturers.

Yours very truly,

H. H. FRANKLIN,
President.

PLAINTIFFS' EXHIBIT NO. 52.

Letter, Packard Motor Car Company to E. J. Gulick, dated March 27, 1916.

(Filed January 27, 1934.)

MT'AKS.

March 27, 1916.
Dict. 3-25-16.

Mr. E. J. Gulick,
Mishawaka,
Indiana.

Dear Sir:—

It is our understanding that you are in a position to obtain for us an assignment of the following Letters Patent:—

876,272	January	7, 1908
923,044	May	25, 1909
923,045	May	25, 1909
1,007,097	October	31, 1911

It is our understanding also that you are the sole and exclusive owner of all rights to the inventions illustrated and described on the following exhibit papers which you left in our office yesterday:

1. Slide Valve Motor illustrated on three blueprints marked "A-1," "A-2" and "A-3" and two photographic prints of patent office drawings marked "A-4" and "A-5," respectively.

2. Motor Piston illustrated and described by a pencil drawing marked "B-1," a two page description marked "B-2," and a blue print marked "B-3."

3. Double Acting Air Cooled Piston Motor illustrated and described by pencil drawing and note thereon and marked "C," this pencil drawing being signed by you and dated November 26, 1915, and witnessed by Mr. S. H. Pond, November 26, 1915.

4. Steering Cross Connecting Rod and Drag Link Connections illustrated by pencil drawing and notes marked "D," the drawing covering both sides of the sheet and being witnessed but not dated by Mr. S. H. Pond, and being supplemented by a verbal description given to the writer yesterday in which it was understood that the connection included two forms of ball joints as well as the particular form of pivoted connection shown in the pencil drawing, and

it being further understood that several other drawings of these connections have been heretofore made by you and are at your home at the present time.

It is our understanding, further that for $2900.00, to be paid by us, you will obtain the assignments for us of the above referred to four patents, and give us assignments of all rights, title and interest in the first three above mentioned inventions relating respectively, to Slide Valve Motors, Motor Pistons and Double Acting Air Cooled Piston Motors, and a license to manufacture or have manufactured for us and to use and sell on our vehicles, the fourth above referred to invention relating to Steering Cross Connecting Rod and Drag Link Connections.

It is our understanding, further, that in view of the fact that there is some slight uncertainty of your being able to obtain assignments of patents Nos. 923,044, 876,272 and 1,007,097, if any one or more of those three patents cannot be obtained for us, the consideration we are to pay shall be reduced $100.00 each for patents Nos. 876,272 and 1,007,097, and $200.00 for patent No. 923,044. In any event, however, No. 923,045 is to be obtained for us. In other words, if you obtain an assignment of No. 923,045 only, the amount to be paid is $2500.00, if No. 923,044 is included also, the amount is $2700.00, if those two and No. 876,272 are obtained, the amount is $2800.00, and if all four are obtained the amount is $2900.00.

It is of course further understood that you will sign all application and other papers that may be necessary for the proper filing and prosecution of patents on the invention referred to.

We hereby accept that above referred to offer and it is our understanding that the papers will be signed up at an early date and the consideration paid to you only upon delivery of the assignments and license to us. Will you kindly acknowledge in writing receipt of this letter and the acceptance of the agreement?

Very truly yours,

PACKARD MOTOR CAR COMPANY.

.....

Patent Counsel.

PLAINTIFFS' EXHIBIT NO. 53.

Letter, E. J. Gulick to Packard Motor Car Company, dated April 1, 1916.

(Filed January 27, 1934.)

(Received Apr 3 1916 By Milton Tibbetts)

HOTEL MISHAWAKA
Bert De Vault, Manager.

Mishawka, Ind., April 1, 1916.

Packard Motor Car Co.,
Detroit, Mich.

Milton Tibbetts, Counsel.

I have your letter and proposal of the 27th relating to certain Patents and designs. I am now trying to close the deal on that basis, but as explained to you during our recent conference, I am rather uncertain of securing those held by Amplex Co. I am of the opinion at this writing that I shall be able to get them, but it may take two or three weeks to do so. The deal will be closed or off in a very few days for their plant and that will settle the matter one way or the other. Do you wish me to in event of sudden opportunity to close to advise you or Rector?

Yours truly,

E. J. GULICK.

PLAINTIFFS' EXHIBIT NO. 54.

Letter, E. J. Gulick to Packard Motor Car Company, dated December 4, 1916.

(Filed January 27, 1934.)

(Received Dec 5 1916 By Milton Tibbetts)

Elkhart, Ind., Dec. 4, 1916.

The Packard Motor Car Co.,
Detroit, Mich.

Gentlemen:—

Attention Milton Tibbetts—Patent Counsel.

Referring to the situation on Patents under date of March 27, 1916 covering your proposition for the following patent numbers—

876,272	Jan. 7, 1908
923,044	May 25, 1909
923,045	" "
1,007,097	Oct. 31, 1911

I am now in position to deliver these Patents and also include the following numbers—874,676, 923,043, 923,046, 971,038 and 1,031,785. I did not advise you relative to the situation as I was unable until recently to clear up matters owing to the sale and transfer of the Amplex plant. I am now, however, in a position to carry out the agreement and wish to know if you would not be interested also in taking over the balance of these Patents as if I dispose of any of them I would much prefer to dispose of them all. I think without a doubt that I could make the price of the remaining Patents such as would be worth your while to take them over also. Please advise me immediately and I will proceed to close up the subject.

Yours very truly,

E. J. Gulick.

Box 553, Elkhart Ind.

Mr. E. J. Gulick,
Box No. 553,
Elkhart, Ind.

Dear Sir:— *Re C-797*

From our telephone conversation I understand that you will be in Chicago Friday of this week and that you will call me up at the office of Rector, Hibben, Davis & Macauley, Harrison 821, and make an appointment for sometime that day. If possible I want to take the three o'clock train back to Detroit but that of course is not imperative.

Please bring with you all papers that you may have relating to the four several inventions which were included in the original proposition, viz: (1) Slide valve motor; (2) Motor piston; (3) Double acting air cooled piston motor, and (4) Steering cross connecting rod and drag link connections.

If you will have all of the papers there I will endeavor to give you some definite answer in connection with this matter.

Very truly yours,

.....

Patent Counsel,
Packard Motor Car Company.

MT'EAP.

PLAINTIFFS' EXHIBIT NO. 56.

Letter, E. J. Gulick to Packard Motor Car Company, dated May 18, 1917.

(Filed January 27, 1934.)

(Received May 19 1917 By Milton Tibbetts)

Elkhart, Ind.
May 18, 1917.

Mr. Milton S. Tibbetts, Counsel,
c/o Packard Motor Car Co.,
Detroit, Mich.

My dear Mr. Tibbetts:—

It has been several weeks since I turned the several patents over to Mr. Rector's office and have heard nothing definite on the subject up to the present writing. I realize of course that Mr. Rector is a very busy man but thought best to call your attention to the subject. I would very much like to get this matter settled up with as little delay as possible as in accepting your proposition it necessitated my tying up considerable money. I believe the assignments were all straight and the fact that I did not make an assignment to your company was that I anticipated that either yourself or Mr. Rector would desire to draw up such an assignment paper as would meet your requirements covering the several patents as well as the inventions not applied for. I trust you will give this subject your early attention and advise Mr. Pond accordingly, that the subject may be properly adjusted and closed up.

Yours very truly,

E. J. GULICK.

PLAINTIFFS' EXHIBIT NO. 57.

Letter, E. J. Gulick to Packard Motor Car Company, dated March 26, 1917.

(Filed January 27, 1934.)

(Received Mar 31 1917 By Milton Tibbetts)

Elkhart, Ind., Mar. 26-17.

Packard Motor Car Co.,
Detroit, Mich.

Mr. Tibbetts, Counsel.

My Dear Mr. Tibbetts:

I have yours of the 23d and in reply state that the delay was caused only in getting together the records of receiverships and transfers of various patents so that I can give you a clear title to same without question. The matters I now have complete and Mr. Pond has ordered copies from Washington that all may be clear and correct. I received word from him Saturday that he had not received a reply yet but expected to first of the week I can assure you I am not holding up matter any at this end. I am so very busy that I have turned over all to Pond and for'd the papers to him as I understood you to say that Mr. Rector would look after your interest from that end and with Pond relative to the details of assignments. I am

Very truly yours,

E. J. GULICK.

PLAINTIFFS' EXHIBIT NO. 63.

Letter, Ray Stewart Gehr to E. J. Gulick, August 22, 1923.

(Filed January 27, 1934.)

August 22nd, 1923.

Mr. Edward J. Gulick,
c/o Conn Instrument Company,
Elkhart, Indiana.

In Re: Gulick Piston Application
Serial No. 204,661.

Dear Mr. Gulick:

In accordance with my telephone conversation with you this forenoon, I am encolsing herewith preliminary statements to be executed by you in the twelve interferences in which your above application has become involved.

In two of these interferences, the claims in issue are broad enough to read upon the pistons which you actually constructed in 1911 and again in 1914. In the other ten interferences, the claims involved will not read upon the pistons you actually constructed but only upon the form of construction with webs joining the bosses to the skirt and the head parts. This latter form of construction is shown in the sketch marked B-1 and which we attached to the history you dictated here in Cleveland. This sketch, I understand, you made sometime while you were with the Excelsior Company in Chicago, prior to the Elgin races of 1911, to which you drove the car just then fitted with the slit and split pistons.

From the Motor Age, Chicago, I learn the Elgin races that year were held August 25th and 26th. This seems to be the only date which we can fix definitely for the sketch B-1 and the pistons which you fitted in 1911.

Accordingly, in the two interferences above referred to, I have named "on or about August 25th, 1911," as the date for your conception, drawings, disclosure and reduction to practice. In the other ten interferences, I have named "On or about August 25th, 1911," as the date for your conception and drawings (sketch B-1) and I named "on or about June 20th, 1914," as the date on which you disclosed the invention to others. I placed this latter date, June 20th, 1914, arbitrarily just a few days before June 24th, 1914, the date which appears on the drawings made for you at Mishawaka. Doubtless,

you disclosed this subject matter to the draftsman a few days before he completed and dated the drawing.

As far as I know, you never constructed pistons as shown in the Mishawaka drawing or the drawings of your application and I accordingly stated in the statements of the ten interferences that the invention has not been reduced to practice by you other than by the filing of your application, such filing, of course, being a "constructive" reduction to practice.

The statements must be filed in the Patent Office on Monday, August 27th, and I am afraid that the time is too short for you to mail these statements back to Cleveland, so after you have executed them, I wish that you would mail them direct to the Commissioner of Patents at Washington. You will note that I have placed each statement in an unsealed envelope properly marked for filing in the Patent Office. After you have executed each statement, please return it to its proper envelope and seal the envelope, then enclose all of these sealed envelopes in the larger envelope which I am enclosing and which is addressed to the Commissioner of Patents, Washington, D. C., and at once mail it. You will understand, of course, that only the face copy of each statement is to be placed in its sealed envelope. Of the two carbon copies which I am sending, of each statement, one can be retained by you for your files, while the other should be filled in by you and returned to me for my records.

I think that I have fixed the dates as accurately as it is possible to do it but if you find anything seriously wrong, I suggest that you telephone me at once upon receipt of the statements. I shall be in Cleveland tomorrow, Thursday, but will be in Detroit all day Friday and you can reach me there by calling the Arctic Ice-Cream Company.

Yours very truly,

RSG-MS

P. S. I see that these statements will be too bulky to go in one envelope through the mail, so I am enclosing two stamped envelopes addressed to the Commissioner of Patents and you can divide the twelve statements between them.

PLAINTIFFS' EXHIBIT NO. 64.

Letter, E. J. Gulick to Ray Stewart Gehr, dated August 23, 1923.

(Filed January 27, 1934.)

(R. S. Gehr Aug 24 1923 Received)

C. G. CONN LTD.
ELKHART, IND.

August 23, 1923.

Ray Stewart Gehr,
Euclid Building,
Cleveland, Ohio.

Dear Mr. Gehr:

I am in receipt of your communication and instructions of August 22nd, covering interferences, Piston Application, Serial No. 204,661, and as far as I can see are as correct as could be expected under the circumstances.

I have today executed and forwarded the face copies to Commissioner of Patents, and also enclosed copies executed for your files.

By the way, do you not think that it would be a good plan for your clients to own the last Piston Patent which was issued to me? That is the one with the demountable skirt, with which I believe you are familiar. I am not asking no great amount for this as I realize this one patent by itself is of no great consequence, however, it would add a link in the chain of patents controlled by your clients. I would consider at the present time any reasonable offer. Would be pleased to hear from you on the subject.

Yours very truly,

E. J. GULICK.

IN THE UNITED STATES PATENT OFFICE.

STEPHEN D. HARTOG vs. ELMER C. LONG vs. EDWARD J. GULICK.	INTERFERENCE No. 49,569.
ELMER C. LONG vs. STEPHEN D. HARTOG vs. EDWARD J. GULICK.	INTERFERENCE No. 49,570.
ELMER C. LONG vs. EDWARD J. GULICK.	INTERFERENCE No. 49,571.

TESTIMONY TAKEN AT SOUTH BEND, JULY 21, 1926.

Testimony taken in behalf of Edward J. Gulick pursuant to the annexed notices, and by agreement of counsel, in the office of Frank Batson, Notary Public in and for St. Joseph County, Indiana, Court Reporter, County Courthouse, South Bend, Indiana, beginning at 10:30 o'clock A. M., July 21, 1926.

Present: Ray S. Gehr, F. O. Richey and William C. McCoy on behalf of Edward J. Gulick. L. C. Kingsland on behalf of Stephen D. Hartog. H. C. Fletcher on behalf of Elmer C. Long.

DEPOSITION OF EDWARD J. GULICK.

EDWARD J. GULICK, appearing as a witness in his own behalf, having first been duly sworn, testifies as follows in response to interrogatories of counsel: [40]*

* Figures in brackets indicate the ends of the pages of the Patent Office Deposition.

DIRECT EXAMINATION by Mr. F. O. Richey.

Q. 1. Please state your name, age, residence and occupation. A. Edward J. Gulick, 58 years old, residence, Elkhart, Indiana, 2404 South Martin Avenue, works manager and chief engineer in the C. G. Conn Limited, Elkhart, Indiana.

Q. 2. Are you the Edward J. Gulick, the applicant in the United States for letters patent, serial number 204,661, filed November 30th, 1917, and involved in the above entitled interference? A. Yes.

Q. 3. Beginning just prior to the year 1911, will you give a general outline of your employment up until the present day, stating the periods of employment, the dates when you changed employment, the character of each employment, the name of the concern and the character of its product? A. Prior to 1911 and up until September, 1910, I was connected with the Amplex Motor Car Company as secretary and general manager. After September, 1910, until the 1st of January, 1911, I was connected with the Excelsior Motor and Manufacturing Company of Chicago, Illinois, as works manager. From January 1st, 1911, until November 1st, 1911, I was connected with the Excelsior Company in the same capacity. After November, 1911, and until the early part of 1914, I was not connected with any company, but was engaged in a general way in the project organizing a new Motor Manufacturing Company. This, however, was not completed until about the 1st of June, 1914, at which time a Mr. Pulsifer and myself took over from the receiver, M. W. Mix, the Amplex Motor Car Company of Mishawaka, Indiana. A company was organized known as the Amplex Manufacturing Company, and was operated until about the 1st of November, 1914, when it went into the hands of a receiver, Kamm. From then on until about the 1st of March, 1915, I was engaged in an attempt to recover the property from the receiver. As I did not succeed, I then became connected as works manager and chief engineer of C. G. Conn, Limited, Elkhart, Indiana, in which capacity I am at the present time.

Q. 4. The Amplex Motor Car Company was located where? A. Mishawaka, Indiana.

Q. 5. What did they make? A. Automobiles. [41]

Q. 6. What did the Excelsior Motor and Manufacturing Company make? A. Automobile motors, motorcycles and motorcycle motors and bicycles.

By Mr. Richey: I produce a sketch and ask that it be marked for identification, Gulick Exhibit No. 1.

Q. 7. Referring to this sketch, Exhibit No. 1, will you state who made it, if you know? A. I made it.

Q. 8. How do you identify it as your work? A. Well, I don't think anybody would make one just like it, and, being, my own work, I can't help but identify it. I can identify my handwriting. The upper writing above the section marked "A" is my handwriting; also, "C" and "D"; and the writing below "B" and the signature.

Q. 9. How about the reference numbers and lines? A. The reference numbers and lines are also in my handwriting. All of the marks on the sheet exhibited, with the exception of that marked "Gulick Exhibit No. 1" and that marked "B-1" in blue pencil, are my writing.

Q. 10. Where and when did you make this drawing? A. This drawing was made shortly after the 1st of January, in 1911, at my residence, 6658 Lowe Avenue, Chicago.

Q. 11. How do you fix the date which you have given for the making of this sketch? A. Shortly after or about January 1st, 1911, Excelsior Motor Company decided to go into the motorcycle racing game. A motordrome for motorcycle racing was expected to be opened in the early spring, and the Excelsior Company was experimenting with racing motors. Considerable trouble was experienced with the ordinary type of piston, and to eliminate those troubles, I sketched up the piston as shown as Gulick Exhibit No. 1.

Q. 12. What kind of a piston is shown in this Exhibit 1—a motorcycle or automobile? A. This is intended for a motorcycle, but could be used as well for an automobile motor.

Q. 13. To whom, if anybody, did you disclose or show this drawing, Exhibit 1? A. It was shown to my wife and, I think, to one or two other parties, friends of ours, at the time. [42]

Q. 14. Do you remember the circumstances under which you showed this to your wife? A. I do.

Q. 15. Will you recite them briefly?

By Mr. Kingsland: The question is objected to as incompetent, calling for a disclosure to a witness not qualified to testify.

A. I disclosed this to my wife and explained it to her, and further advised her that I believed it was a

good idea, as I wished her to be thoroughly familiar with it in case that anything should happen to me, she might be able to derive some benefits from it.

Q. 16. When was this disclosure made? A. In the early part, shortly after the 1st of the year, 1911.

Q. 17. Is your wife living now? A. She is not.

Q. 18. When did she die? A. In April, 1914.

By Mr. Kingsland: The testimony of this witness of making of drawings or disclosures prior to August 25, 1911, is objected to as contrary to the preliminary statements.

By Mr. Fletcher: The same objection.

By Mr. Richey: Notice is given that motion will be made to amend the preliminary statements of Mr. Gulick so that they shall conform to the date given in the testimony, at a seasonable time. Although a careful and diligent search was made before the preparation and filing of the preliminary statements, more recent investigations have developed further information.

Q. 19. When was the motordrome for motorcycle racing referred to in your answer to Q. 11 opened in Chicago? A. It was opened for preliminary work several weeks prior to the official opening in July of 1911. The reason for this was that the track was complete, but the seating capacity had not been completed up until the official opening.

Q. 20. Have you any other way of fixing the date of the making of Exhibit 1 than you have named? A. None other except that we made a set of these pistons for a motorcycle motor which was block tested to be used in a racing motor prior to the official opening. Further the pistons used in this test were of the [43] standard racing type and were split to develop the split skirt idea, but were not ribbed exactly as shown in this sketch.

Q. 21. By official opening, you mean the official opening of the motordrome, do you not? A. I mean the official opening of the motordrome to the public in July, 1911.

Q. 22. Was this before or after the receivership of the Excelsior Company? A. After the receivership.

Q. 23. Will you give a brief description of the block test of these motorcycles tested, and say how they operated, and what they did? A. These pistons were put in a specially constructed two-cylinder, air-cooled motor-

cycle motor, and they were put on the test block and ran for several hours, and the pistons used in these motors for racing purposes were of a very light semi-steel construction, and as the standard piston for this purpose was not ribbed according to the sketch, but the skirt was split, weakened them, and they were not put in the races. As to just the nature of the breaking up of them, I cannot say. The speed of this motor was something over four thousand R. P. M. Had they been constructed particularly for the work as per sketch, the troubles experienced would not have occurred. They, however, demonstrated in this test their ability to run and adapt themselves without seizing or scoring, which was one of the troubles with the standard type piston.

Q. 24. Did you do any experimental work on racing motorcycles at any other time than during the first part of 1911? A. No other work in connection with this piston on a motorcycle.

By Mr. Richey: I offer in evidence as Gulick's Exhibit No. 1 the drawing marked for identification Gulick Exhibit No. 1.

By Mr. Kingsland: The offer in evidence of Exhibit No. 1 is objected to on the ground that it is not warranted by the preliminary statement; on the further ground that it has not been sufficiently proven, and upon the further ground that it has not been connected with the issues of the interference, and is therefore incompetent and immaterial.

By Mr. Fletcher: Same objection. [44]

By Mr. Richey: The notary is requested to mark for identification the two pages of written matter which are now produced, Gulick's Exhibit No. 2.

Q. 25. Who wrote up the description of Exhibit No. 2? A. I did.

Q. 26. How do you identify it as your work? A. It is my handwriting.

Q. 27. Where and when was this Exhibit No. 2 written up by you? A. In the early part of 1911, shortly after the first of the year, and at the same time that Exhibit No. 1 was made.

Q. 28. And at the same place? A. Same place.

Q. 29. Were the two of them ever attached together? A. They were.

Q. 30. What construction is described in Exhibit 2? A. A construction as shown in No. 1.

Q. 31. I will ask you to read the descriptive matter of Exhibit No. 2 in the record.

A. "Relating to an Engine Piston which provides for and prevents seizing, binding or scoring when hot or oversize. It is a well known fact that all engine pistons are necessarily made smaller than the cylinder in which they operate to provide for lubrication and prevent seizing or cutting due to the expansion of the piston in the cylinder when hot.

1. The piston consists of a head 1 having a groove 6 for carrying packing rings and a body 2, which provides bearing surface and which is split as indicated by 7 to provide for expansion.

2. The Head 1 and Body 2 are held together by the ribs 3 and 4. Ribs 3 and 4 carry bosses 5 for receiving the piston pin. Ribs 3 and 4 are not limited to shape or position, and the number of ribs and location and shape may be altered as desired.

The head 1 is machined small enough to allow for expansion and not bind or seize, while the body 2 is machined as close to size as is possible to make a fit and any expansion is taken up by the slot 7 and which prevents any seizing or binding between the piston and cylinder walls in which the piston [45] moves. By this construction it is possible to make a fit that prevents any pounding which is prevalent with the common type of piston."

Q. 32. By whom or to whom was Exhibit 2 read? A. It was read to my wife.

Q. 33. State when and under what circumstances? A. It was read to her in the early part of 1911, in the evening at the time of which the sketch was made and at the time at which these specifications were drawn up.

Q. 34. You brought a patent suit against the Packard Motor Car Company, didn't you? A. I did.

Q. 35. When was this, to the best of your recollection? A. About the middle of the year of 1913.

Q. 36. In what court was this suit brought? A. Chicago, Cook County.

Q. 37. It was in the Federal Court, wasn't it? A. I believe it was.

Q. 38. Was that the only suit you brought against the Packard Company on a patent? A. It was.

Q. 39. Now, did the events which you have recited regarding Exhibits 1 and 2 occur before or after the bringing of this suit? A. Before.

Q. 40. Where have Exhibits 1 and 2 been since they were made by you in the first part of 1911? A. They were in my possession until turned over to Offield, attorney, of Chicago, and later to S. W. Pond, of Pond and Wilson; later they came into my possession and were turned over to the Packard Motor Car Company; since turning them over to them, do not know just where they have been.

Q. 41. When were they turned over to the Packard Company? A. It was about a year after my settlement of a suit with the Packard Company in 1915, which I think was in 1916.

Q. 42. To whom did you deliver them for the Packard Company? A. To Milton S. Tibbetts.

Q. 43. He was and is still the patent attorney for the Packard Company? A. He is.

Q. 44. Did you deliver them to him in Detroit? A. I did.

Q. 45. Did he write you a letter about them later? A. He did. [46]

Q. 46. Can you produce that letter? A. I cannot.

Q. 37A. Have you searched for it? A. I have.

Q. 38A. Do you know where it is? A. I do not.

By Mr. Richey: I offer in evidence, as Gulick's Exhibit No. 2 the descriptive matter so marked for identification.

By Mr. Kingsland: The offer in evidence of Exhibit No. 2 is objected to on the ground that it is not warranted by the preliminary statements and upon the further ground that it is not evidence of the invention covered by the counts in the interferences.

By Mr. Fletcher: Same objection.

By Mr. Richey: I produce a copy of a letter from Packard Motor Car Company to E. J. Gulick, March 27, 1916, and ask that it be marked for identification, Gulick Exhibit 3.

Q. 39A. Will you look at Exhibit 3 and if this refreshes your recollection as to the date when you left Exhibits 1 and 2 with Mr. Tibbetts, will you state that date as near as you can?

By Mr. Kingsland: The question is objected to as incompetent as requiring a double inference, the letter of which a copy has been produced is the best evidence and no proper basis has been laid for the reference to a copy.

A. I was in Detroit the day prior to the writing of this letter, Exhibit 3, which would be either March 24th or 25th, 1916, as according to this Exhibit 3, Mr. Tibbetts dictated this letter on the 25th.

Q. 40A. Now can you state the date when you left Exhibits 1 and 2 with Mr. Tibbetts? A. Exhibits 1 and 2 were left on the same date, while in Detroit.

Q. 41A. That is, on the 24th or—25th of March, 1916? A. Yes.

Q. 42A. Did you show this Exhibit 2 to anyone except your wife, prior to the time you showed it to Mr. Offield? A. Not that I recall.

Q. 43A. About what were the dates that you showed Exhibits 1 and 2 to Mr. Offield and to Mr. Pond? A. [47] Exhibits 1 and 2 were turned over to Mr. Offield, as near as I can recall, in 1913.

Q. 44A. The descriptive matter in Exhibit 2 refers to the construction shown in Exhibit 1, does it not? A. It does.

Recess until 2:00 o'clock P. M.

Q. 45A. Were Mr. Offield and Mr. Pond experienced in motors so that they were capable of understanding the disclosure of Exhibits 1 and 2?

By Mr. Kingsland: The question is objected to as calling for a conclusion or opinion of the witness.

A. As attorneys experienced in handling such matters, yes.

Q. 46A. Both of these men were patent lawyers who had been in practice, to your knowledge, for years before you made the disclosures to them, were they not? A. They were.

Q. 47. Now you have said that you fixed the dates when you made Exhibits 1 and 2 and the dates of the associate events you have related as prior to the opening of the Chicago motordrome, as prior to your suit against Packard, and as prior to your wife's death, are there any other events by which you can fix the dates when you made Exhibits 1 and 2 and the associate events, and if so will you state what they are? A. The Exhibits 1 and 2 were made prior to the Excelsior plant being turned over to Schwinn, the purchaser, in November, 1911; also the paper on which these sketches were made were an inferior grade of bond paper which was purchased by the Amplex Motor Car Company, a quantity of which I had taken to my home in Mishawaka, and

later, when I moved to Chicago, about the 1st of December, 1910, I took it with me. This paper was used principally for sketching, and some of it remained in my possession until 1914, the time which my wife died. At that time it was scrapped, as all my possessions were sold.

Q. 48. That is, you mean that such of this paper as was on hand in 1914, when you moved back to Mishawaka, was destroyed? A. Yes. [48]

Q. 49. The description of the construction shown in Exhibit 1 and which description is on Exhibit 2, says that "any expansion is taken up": will you explain how this expansion was taken up in the piston illustrated in Exhibit 1? Or how you intended it to be so taken up? A. The object of the slot 7 was to permit of the closing up of the body 2; the body being sufficiently flexible to permit of closing up slightly of slot 7. By this slot, the action would be similar to the closing of a piston t[illegible]

Q. 50. What would happen to the webs or ribs 3 and 4 during this expansion and contraction?

By Mr. Kingsland: The question is objected to as incompetent on the ground that the witness has not qualified to interpret the disclosure as shown by the Exhibits adduced, and the witness has testified to no fact justifying his supplementing the disclosures of these exhibits.

A. Ribs 3 and 4 would flex slightly in connection with body 2.

Q. 51. Of what material were pistons made in 1911? A. They were called semi-steel, a gray-iron mixture with steel introduced.

Q. 52. What material did you contemplate for the piston illustrated in Exhibit 1 and described in Exhibit 2? A. No specific material was specified. Either gray iron or aluminum could be used, depending on the design and its requirements.

Q. 53. Webs of these materials would be flexible, wouldn't they? A. They would to a degree sufficient to provide the necessary flexibility to prevent seizing or scoring.

Q. 54. The motorcycle pistons which were made in 1911 with the slits in them, as you have testified, were made of what material? A. Semi-steel. At least that is what it was supposed to be.

Q. 55. State whether or not the piston shown in Exhibit 1 could operate as described in Exhibit 2 without

some flexing of the ribs or webs 3 and 4. A. It could not, without a very slight flexing of the ribs.

By Mr. Kingsland: It is now moved that all evidence in connection with Exhibits 1 and 2 be struck out on the ground that the structure there [49] disclosed upon the admissions of this witness are inoperative.

By Mr. Fletcher: The same objection as noted by Mr. Kingsland.

Q. 56. Did the Excelsior Company have a Renault type of automobile while you were with the company, and particularly during the year 1911? A. They did.

Q. 57. Who operated this car? A. I operated one of them.

Q. 58. What kind of pistons were in the Renault type of car that you operated? A. During the period of a year they had a split skirt piston installed in the motor.

Q. 59. What kind of piston was in the car before the installation of the split skirt piston? A. A standard type piston.

By Mr. Richey: The notary is requested to mark for identification the blue print which I produce, Gulick's Exhibit No. 4, and the piston which I produce, as Gulick's Exhibit 5.

Q. 60. Will you compare the piston in the Renault type of car before the installation of the split piston with the piston illustrated in Exhibit 4 and the piston Exhibit 5? A. Exhibits 4 and 5 are the same piston, but are not of the split type, and are the same as was installed in the Renault car prior to the installing of the split piston.

Q. 61. Do you know where Exhibit 4 was made, or anything else about its history? A. It was evidently made in the drawing room of the Excelsior Motor Manufacturing Company, and as the motor was designed by L. P. Mooers, I believe that Exhibit 4 was designed by him.

Q. 62. Was it the custom with the Excelsior Company to print its name and place the dates on its tracings when you were there? A. It was.

By Mr. Richey: The print marked for identification is offered in evidence as Gulick's Exhibit No. 4.

By Mr. Kingsland: To the introduction in evidence of Exhibit No. 4 is objected to on the ground that it is immaterial and has not been connected in

any way with the matters involved in this interference. [50]

Q. 63. Do you know where Exhibit 5 came from? A. I do not, I never saw it before. But from its dimensions and appearance, I would say it was made from the blue print Exhibit 4.

Q. 64. Did you see Exhibit 4 or the tracing from which it was made or any other print made from that tracing while you were employed with the Excelsior Company? A. I cannot say that I ever saw the tracing, but I have seen numerous prints same as Exhibit No. 4 in the machine department of Excelsior Motor Manufacturing Company during the period of 1911, as this was a standard type of piston for the Excelsior motor.

Q. 65. Who molded these pistons in 1911? A. A few of them were made by a Chicago foundry. I cannot recall their names. The major portion of all of them, to the best of my recollection, were cast by a concern in the east. I believe it was the Manufacturers Foundry Company, as they cast all of the motor cylinders, I believe they also cast the pistons.

Q. 66. Were any of these pistons made by a concern in Cleveland, Ohio? A. They might have been, as the purchasing department were compelled to secure them at times at different places.

By Mr. Richey: Piston marked Gulick's Exhibit 5 is offered in evidence as Gulick's Exhibit 5.

By Mr. Kingsland: The introduction in evidence of Exhibit No. 5 is objected to as incompetent, as the witness was unable to identify it, and it is further objected to as immaterial, not having in anywise been connected with the matters in controversy.

By Mr. Fletcher: The introduction of Exhibit No. 5 in evidence is objected to on the ground that it has not been sufficiently identified, and on the further ground that the exhibit is not in any way connected with the issues involved.

By Mr. Richey: I now produce a pattern and ask that it be marked for identification Gulick's Exhibit 6; and a core box, and ask that it be marked Gulick's Exhibit 7.

Q. 67. Will you look at the pattern and core box marked Exhibits 6 and 7 and state what they are and what you know about their history? A. Exhibit 6 is a [51] pattern for piston as shown in Exhibit 4, and Exhibit 7

is the core box of same. The Excelsior Motor Company were the owners of these patterns and core boxes, the product of which was used in the manufacture of Excelsior motors during the year of 1911.

Q. 68. Can you tell if Exhibit 5 was made with Exhibits 6 and 7? A. I cannot say that Exhibit 5 was made from the pattern, Exhibit 6 and from the core box, Exhibit 7, as the Excelsior Motor Company had several of these same patterns and core boxes exactly duplicating Exhibits 6 and 7.

Q. 69. You have said that the pistons like Exhibit 5, which were in the Renault type car you operated in 1911, were taken out and slitted: can you explain how they were slitted? A. The pistons as used in the Renault cars were new pistons and were slotted across the top of the skirt just below the upper ring between the piston pin bosses on one side only, and were then diagonally slotted throughout the length of the skirt on one side, being the same side.

By Mr. Richey: I ask that the piston which I now produce be marked for identification Gulick's Exhibit 8.

Q. 70. Will you compare the piston Exhibit 8 with the slitted pistons which were placed in your Renault car in 1911? A. They were the same in the car as Exhibit 8.

Q. 71. How many of these slitted pistons were installed in this car? A. Four.

Q. 72. This was an air-cooled car? A. It was not: it was a water-cooled.

Q. 73. When were these slitted pistons like Exhibit 8 installed in your Renault car? A. They were made during the month of July, 1911, and after passing through the test department, were installed in the Renault car just prior to the Elgin road races which were near the middle of August in 1911.

Q. 74. Have you any other way of fixing the date of the making and installation of these slit pistons? A. Yes.

Q. 75. Will you recite them? A. After the block test, the first time the Renault car was driven on the road with the split pistons installed was to the Elgin [52] races; further, that these pistons were being made at the time we were experimenting with motorcycle engines for racing purposes at about the time of the Chicago motordrome; by this, I mean the official opening. Further, I would state that it was quite necessary to do a lot of

special work in installing this motor, and there was a great deal of rush to get it done in time to drive it to Elgin.

Q. 76. Did you see the slits cut in any of these pistons? A. I don't know that I saw them while they were cutting them, but I saw them before they were installed in the motor.

Q. 78. Who gave the instructions for slitting them? A. I did.

Q. 79. To whom? A. To the best of my recollection, they were given to a Mr. Johnson, who was foreman of the tool room where this work was done. It is possible, however, that some of the work may have been done in the piston production department under the instructions of Mr. Johnson to the foreman, Mr. Biers.

Q. 80. Did you see these pistons installed in the car? A. I saw them when they were installing them in the motor, prior to its going to the test block, but did not see them afterwards until the motor was torn down.

Q. 81. Who installed them in the car? A. Morris Engle installed the motor in the car.

Q. 82. Who installed the pistons in the motor? A. There were a number of employes engaged in this work, and I do not know their names.

Q. 83. Of what material were the pistons made? A. A selected quality of gray iron.

Q. 84. What was the clearance between the slitted pistons and the cylinder walls? A. The head clearance about the rings was made the same as the standard piston, which was about seven thousandths; the skirt clearance was made to fit the cylinder walls as close as it was possible to fit them in dry.

Q. 85. Can you give the skirt clearance in thousandths of an inch? A. Not more than one and one-half thousandths. Practically impossible to get much closer owing to the fact that the pistons were seldom absolutely round after the final finish grinding, which was [53] seldom perfectly true. With a perfectly true bore and a perfect piston they could be fitted somewhat closer and not seize.

Q. 86. How did this compare with the skirt clearance of the standard type unsplit piston used in this motor prior to the installation of those like Exhibit 8? A. The standard piston specifications were for four thousandths clearance of the skirt; however, there was a variation in cylinder bore and piston diameter, and the clearance usually varied from four to seven thousandths.

Q. 87. You have spoken of block tests of pistons like Exhibit 8: will you explain these block tests, stating where they were made, when they were made, and by whom they were made? A. By block tests was meant putting the motor in a test frame; the motor is then run by belt or by attaching another motor to it for a period of four hours or more. It is then put under its own power for a period of time, running under that load; later the load is increased and the final test for power, speed and so forth, either a brake is used, and which was used at that time, and at the present time most of the motors are tested for power loads by electric generator for absorbing the load. This motor was tested as above described by brake, as a number of testers were employed in that department, do not know who made the test; but was present when it was being run. This test was run in August, 1911, at the Excelsior Motor Company plant test room just prior to the Elgin races.

Q. 88. Who saw it besides you? A. Morris Engle saw the motor running on the block, the same Morris Engle as installed it in the car. Others saw it, but I do not know their names.

Q. 89. How long did it take to make the test? A. The motor went on the block late in the afternoon, was run all night, came off the following day late in the afternoon, and was installed that evening, and the next morning early completed, which was the day of the Elgin races.

Q. 90. You drove it to Elgin with the split pistons like Exhibit 8 in it, did you? A. I did.

Q. 91. Did you drive it on any other trips? A. I did.

[54]

Q. 92. How far did you drive this car with the split pistons like Exhibit 8 in it? A. I would say at least three thousand miles.

Q. 93. Over how long a period of time? A. From the day of the Elgin races in August until about the middle of October, 1911.

Q. 94. At what speeds did you drive your car with these pistons installed? A. It was driven at all speeds up to sixty miles an hour.

Q. 95. Do you remember a trip you took with Mr. Williamson? A. I do.

Q. 96. Will you state who was on this trip, what was the length of the trip and when it was made? A. This trip was made about the first of October. Mr. Williamson and his wife, myself and my wife, drove from Chicago

to Mishawaka, Indiana, and return, two days, and travelling all told around three hundred miles.

Q. 97. Will you describe how these pistons like Exhibit 8 operated in the motor of your car during its use by you and when the block test was being made? A. During the block test they operated perfectly; and during the road work, from the time they were installed in August and until about the 1st of October, they worked entirely satisfactorily. On the trip to Mishawaka, about the last of October, on the return, near Michigan City, they developed trouble, a peculiar sound in the motor indicated trouble. I called Mr. Williamson's attention to it, told him I believed something had gone wrong with one of them. This trouble, however, was evidenced only at speeds above thirty miles an hour. On my return to Chicago the car was driven for a few days in October, and then torn down. That is, the motor was removed, and an examination disclosed that one of the pistons only had cracked through from the slot below the lower ring into the piston boss. This caused a slight enlargement of the piston pin hole, which was responsible for the noise which we heard. The pistons were removed from the motor and standard type pistons installed. That was the last they were used in the Excelsior motor. This was October, 1911.

Q. 98. What was the condition of the other three Exhibit 8 pistons? A. They were in perfect [55] condition. There was no signs of cutting or scoring, and the motor never exhibited at any time any signs of piston slap or laboring.

Q. 99. The noise in the injured piston was due to the fact that the pin was loose in the enlarged hole, was it not? A. It was.

Q. 100. What, if anything, did you say to Mr. Williamson on this trip about the slits in the pistons? A. I explained to Mr. Williamson how these pistons were constructed, and as he was an automobile man of some years' experience, he was very much taken with the idea; and further, I told him, after I had removed the pistons, explaining to him the causes of the noises which we had heard on the trip.

Q. 101. Where are these pistons now? A. I do not know.

Q. 102. Do you know what became of them? A. I do not, as the Excelsior Motor Company was sold shortly after the first of November, 1911, and much of the

motor material which was considered as scrap was disposed of prior to his taking it over.

Q. 103. Who removed the pistons from the motor? A. The motor was torn down in the erecting department, and I do not know the employes' names who did the work.

Q. 104. Do you know of anyone else than those you have named who saw any of these Exhibit 8 pistons? A. There were a number of Excelsior employes who saw them, but I do not know their names.

By Mr. Richey: The piston marked for identification Exhibit 8 is offered in evidence as Gulick's Exhibit No. 8.

By Mr. Fletcher: The introduction in evidence of Exhibit No. 8 is objected to as incompetent on the ground that it has not been sufficiently identified.

By Mr. Kingsland: It is obvious that the testimony of this witness in relation to Exhibits Nos. 5 to 8 inclusive is immaterial to the counts of the interferences Nos. 49,569 and 49,570, in which the party Hartog is interested. If it is counsel's intention to urge any materiality, I now desire to make it clear that an objection is made to any testimony [56] concerning these exhibits as being applicable to the two interferences above numbered.

Q. 105. Will you explain why you slitted pistons like Exhibit 8 and used them instead of making them up like shown in Exhibit 1 in 1911? A. Excelsior Motor Manufacturing Company at that time was in the hands of creditors committee or a receivership and I had instructions from the chairman of the committee to make no expenditures on experimental work for automobile motors, as it was the intention to discontinue the manufacture of automobile motors in event of the receivership being dismissed. Therefore, I could not make up any special constructions.

Q. 106. Was the Excelsior plant sold, and if so, when, and to whom? A. Excelsior plant was sold to a man by the name of Schwinn of Chicago, about the first of November, 1911, and I turned over the keys to him November the 11th, 1911.

Q. 107. When did you leave the employ of the Excelsior Company? A. About one week following turning over the keys to Mr. Schwinn.

Q. 108. Will you give your reasons for putting standard pistons back in the motor of this car after the

removal of the Exhibit 8 pistons? A. One of the reasons was that it was not a standard piston and could not be sold as such to any of Excelsior Motor Company's customers; another was in order that all motors were to be disposed of, and no others were to be manufactured by the Excelsior Company; further, as I, as the inventor of the idea, I considered it was of value, and as it was designed on my own time, it was my desire to hold it; further, I did not know what Schwinn's attitude might be in connection with the motor end of the industry.

Q. 109. Did you make any other sketches of slitted pistons than Exhibit 1, prior to November, 1911? A. I did not.

Q. 110. When did you conceive the idea as shown in Exhibits 1, 2 and 8? A. In the latter part of 1908.

By Mr. Kingsland: The answer of the witness is objected to and it is moved that it be striken out on the ground that it fails to conform to the preliminary statements. [57]

By Mr. Fletcher: The same objection.

Q. 111. Will you state just what particular construction you conceived in 1908, and state why you did not proceed with it at that time? A. In 1908 I was manufacturing automobiles with the Amplex Motor Car Company of Mishawaka, Indiana. We were building a two cycle motor, were having a great deal of trouble with pistons, owing to the fact that they were of large bore and being of two cycle construction, the pistons became very hot, caused considerable trouble from expansion, causing scoring, and when loose enough to operate properly, under these heat conditions were noisy, slappy. I conceived the idea of splitting these pistons the same as Exhibit 8, but upon investigation I found it would not work in a two cycle motor, as the port hole bridges were very narrow, and the diagonal slot would uncover the exhaust ports on the compression stroke and cause the charge which was compressed in the base of the motor to leak out. This made it impracticable with that particular motor. At about that time we were considering also the manufacture of a four cycle motor and it was my intention to develop this piston for that purpose. However, as we did not enter the field of four cycle motors up until the time I left the Amplex Company in 1910 I had no chance to further carry out the idea until I became connected with the Excelsior Motor Manufacturing Company.

Q. 112. How were you engaged between November 1911 and the fall of 1913? A. I was in Syracuse, New York, through the early part of 1912, and back in Chicago in the fall of 1912. I was also back and forth between the east and Chicago up until the middle of 1913. I was engaged with one party by the name of Pulsifer in an attempt to organize an automobile company to take over the Amplex Motor Car Company of Mishawaka, which was about to go into the hands of a receiver. This effort, however, did not mature, and it was some time later before we were successful.

Q. 113. What, if anything, did you propose to do through the company which you were to organize with respect to your invention illustrated in Exhibits 1, 2 and 8? A. It was our intention to manufacture a [58] sleeve-valve motor, which I had sketched up and to incorporate in its construction pistons of a split sleeve type.

Q. 114. How did the piston which you planned to install in these motors compare with that illustrated in Exhibit 1? A. It was practically the same as Exhibit 1, with the exception of possibly minor mechanical details.

Q. 115. Did you and Mr. Pulsifer finally succeed in getting a plant? A. We did.

Q. 116. What plant, and when? A. We purchased the plant of the Amplex Motor Company, Mishawaka, Indiana, from the receiver, M. W. Mix, and took official possession shortly after the 1st of May, 1914.

Q. 117. What was the product of this plant at the time you took it over? A. Automobiles.

Q. 118. What kind of motor was used in these automobiles? A. We discontinued the use of the two cycle motor and was using six cylinders Buda four cycle motor.

Q. 119. What kind of pistons were used in these Buda motors? A. Standard gray iron pistons.

By Mr. Richey: I now produce a blue print which is marked for identification, Gulick's Exhibit No. 9.

Q. 120. What does this Exhibit 9 show? A. It shows a type of split piston as designed to use in the E. J. G. motor.

Q. 121. Under whose instruction was the tracing of this print made? A. The original drawing was made under my instruction, and was carried out through Chief Engineer Winchester.

Q. 122. When was the original drawing made? A. Shortly after the—it was made prior to June, 1914.

Q. 123. Where was it made? A. Made at the plant of the Amplex Manufacturing Company, Mishawaka, Indiana.

Q. 124. Did you see it made? A. I saw the drawing as it was being made and when it was completed. It had to pass my approval before being used.

Q. 125. What does the date 6-24-14 on the Exhibit 9 indicate, if anything? A. It means sixth month, twenty-fourth day, year of 1914. [59]

Q. 126. What does it indicate with respect to the completion of the original drawing? A. It means that that is the day the tracing was completed, but does not indicate the date which the paper drawing was made, as this record is supplied only when the tracing is made.

Q. 127. Whose initials are the letters B. E. R. on the bottom of this drawing? A. Bert E. Rockhoff, the man who made the tracing.

Q. 128. Do you know the whereabouts of the original drawing or the tracing from which Exhibit 9 was made? A. I do not.

Q. 129. Do you remember seeing the tracing? A. I saw both the tracing and the drawing prior to the making of the print. This tracing and drawing, with other drawings in connection with this motor, were in the files of the Amplex Motor Company, and they were taken over by the receiver, about November 1st, 1914, and as I had nothing to do with the business after that, do not know what became of them.

Q. 130. The original drawing and the tracing showed the same construction as Exhibit 9, didn't they? A. They did.

Q. 131. When did you first come into the possession of the print, Exhibit 9? A. Shortly after it was made, in July, 1914. As I took copies of all prints made as fast as they were produced, as we were using some of the blue prints in connection with this sleeve motor for promotion purposes.

Q. 132. In whose handwriting is the matter in ink in the lower right hand corner? A. My handwriting.

Q. 133. Will you explain how the piston shown in the Exhibit 9 operated and what it did, or how it was proposed to operate? A. It was proposed to operate practically the same as the piston shown in Exhibit 1; however, the design in Exhibit 9 is mechanically very much

refined, and was designed as shown on Exhibit 9, to be made of gray iron.

Q. 134. There is on the back of this tracing in rubber stamp, "Rec'd—by Buda-Drafting-Dept. Aug. 20 1915." Do you know how this stamp happened to be on there? A. I do.

Q. 135. Will you explain how? A. I forwarded Exhibit 9 to the Buda Motor Company with the idea of [60] enlisting them in the manufacture or use of this piston in their motor, the date of which it was received by the Buda Motor Company, as indicated, was August 20, 1915. It must have been mailed at least two days prior to this.

Q. 136. There is written in your handwriting on the lower right hand corner of this drawing certain descriptive matter: when was that placed on Exhibit 9? A. This handwriting which is an explanation of the operation of the piston, was placed there shortly after my receiving Exhibit 9 in June, 1914, for the purpose of explaining to parties we were attempting to interest in the company its operation.

Q. 137. Will you please read this descriptive matter on the record? A.

"Cross Head Type

Piston in which the Barrel is Split to provide for expansion and of which the Barrel is severed from the head and held by rib which carry the pin Bosses.

Design of Piston which automatically provide for Expansion and contraction without scoring or cutting and permits the piston being ground to practically the same size as cylinder Bore prevents all trouble in fitting and eliminates all piston pounding also wears cylinder more uniform.

It is ideal construction for aluminum pistons as expansion is taken care of without excessive clearance in fact practically no clearance other than a running fit is provided for. Same applies to Gray Iron."

Q. 138. To whom, if anyone, was this descriptive matter disclosed? A. It was disclosed to a number of prospects we were trying to interest in financing the Amplex Manufacturing Company; also to the Buda Motor Company, Harvey, Illinois, and Packard Motor Car Company.

Q. 139. Did you disclose it to Mr. Milton Tibbetts of the Packard Company about March the 25th, 1916, at the

same time you disclosed Exhibits 1 and 2 to him? A. I did.

Q. 140. Who put the B3 on Exhibit 9, if you know? A. I do not know. [61]

Q. 141. Where was the print during the intervening period? A. It was in the—prior to my turning it over to Packard, it was in the possession of the Buda Company for quite a period of time. I cannot recall the exact time, but it was necessary for me to write them for it on two occasions before it was returned. After it was returned it was in my possession until turned over to the Packard Motor Car Company, in March, 1916.

Q. 142. Did Mr. Pond or Mr. Offield see Exhibit 9? A. They did not.

Adjourn until 10:00 o'clock tomorrow morning.

South Bend, Indiana, July 22, 1926. Met pursuant to adjournment. Present, same as before.

Q. 143. Have you been able to think of anything else by which you can identify the time when Exhibit 1 was made by you? A. Yes.

Q. 144. Will you state it? A. In making up this sketch, it was the first time that I gave any personal attention to the mechanical features of a motorcycle motor, and as the development of these motors for racing purposes was going on, in sketching up Exhibit 1, I had in mind the general form of the motorcycle piston, and pictured the sketch about the same as the piston used in the motorcycle, that is, as to shape and dimensions. I never did any other work on a motorcycle except to follow it through until the time it was tested, which was some time prior to July, 1911.

Q. 145. At what other time during your career, except the first part of 1911, did you work on any design relating to motorcycles? A. Never before, or never after.

Q. 146. Who went with you to the Elgin races in the summer of 1911? A. Morris Engle.

Q. 147. Did you attend the opening of the motordrome in Chicago in July, 1911? A. I did.

By Mr. Richey: I offer in evidence as Gulick's Exhibit No. 9, the drawing so marked for identification.

By Mr. Kingsland: To the introduction in evidence of Exhibit No. 9 objection is made on the ground that it is not competent and has not been sufficiently proven. [62]

By Mr. Richey: I produce a blue print and ask that it be marked by identification Gulick Exhibit No. 10.

Q. 148. Will you look at Exhibit No. 10 and state what it shows? A. Exhibit No. 10 shows a sectional view of the E. J. G. motor.

Q. 149. What kind of a piston is shown in it? A. The same piston as shown and described in Exhibit 9.

Q. 150. I notice the piston in Exhibit 10 shows no vertical slit; can you explain this? A. The piston shown in Exhibit 10 is shown in half-section and the fact that a small portion of the slot, that is the vertical slot, which would show in that section of the barrel of the piston, was merely an error in tracing.

Q. 151. Under whose direction was the original of Exhibit 10 made? A. It was authorized by me and made under the direction of an engineer by the name of Winchester.

Q. 152. Who made the original? A. Winchester.

Q. 153. When and where was the original made? A. It was made at the plant of the then Amplex Motor Car Company, in the early part of the year of 1914.

Q. 154. Did you see them working on this drawing at that time? A. I did.

Q. 155. In the lower right-hand corner of Exhibit 10 there are the initials of F. U. W. Whose initials are these? A. Those are the initials of Winchester.

Q. 156. Where is the original of this Exhibit 10? A. The original and the tracing were with the—were in the possession of the company when it was taken over by the receiver in November, 1914. I never saw them after that.

Q. 157. Do you know anything about the history of Exhibit 10 itself? A. It was in my possession until—after the receivership, until I turned it over to the Packard Motor Car Company, in March, 1916.

Q. 158. That is, it was turned over to Mr. Tibbetts at the same time that you delivered to him Exhibits 1, 2 and 9? A. Yes.

Q. 159. When did Exhibit 10 first come into your possession? A. Prior to June, 1914. [63]

By Mr. Richey: I offer in evidence as Gulick's Exhibit No. 10 the drawing which was so marked by identification.

By Mr. Kingsland: The offer in evidence of Exhibit No. 10 is objected to as incompetent and immaterial. It obviously does not show the subject matter of the counts of the interference.

By Mr. Fletcher: Same objection.

Q. 160. Were any of these split skirt pistons made by you or under your direction in 1914? A. Yes.

Q. 161. How many? A. Six were completed and put in a motor.

Q. 162. Will you describe those pistons? You may refer to Exhibits 9 and 10 if you wish. A. The pistons referred to were similar to Exhibit 8, with the exception that there was two ribs extending from the head to the bosses, and that the slot was cut through and down to the ribs, completely around the piston below the lower ring, and the skirt was slotted diagonally.

By Mr. Richey: I ask that the sketch which I now produce be marked by identification, Gulick Exhibit 11.

Q. 163. Will you compare the pistons which you say were made in 1914 with this drawing, Gulick Exhibit 11? A. They were the same construction as shown in Exhibit 11.

Q. 164. When and by whom was Exhibit 11 made? A. That was made November the 8th, 1922, by me.

Q. 165. Where and for what purpose was it made?

By Mr. Kingsland: The question is objected to as immaterial, as it relates to a paper produced or made subsequent to the filing date of all parties involved in the interference, and can be nothing more than a self-serving paper.

A. It was made in Cleveland, Ohio, for the purpose of showing the construction of the six pistons which were placed in a six cylinder motor at the plant of the Amplex Manufacturing Company in 1914.

Q. 166. And it depicts your recollection of those pistons in 1922, does it not? A. It does. [64]

By Mr. Richey: I offer in evidence as Gulick's Exhibit 11 the drawing so marked for identification.

By Mr. Kingsland: The introduction in evidence of Exhibit No. 11 is objected to on the ground that it is incompetent and immaterial.

By Mr. Fletcher: The introduction in evidence of Exhibit No. 11 is objected to on the ground that

it is immaterial and therefore unwarranted, as it is subsequent to the filing date of the applications involved in these interferences.

Q. 167. Will you explain why the 1914 pistons were made like that illustrated in Exhibit 11 instead of that illustrated in Exhibits 9 and 10? A. The piston as made in Exhibit 11 was made from a standard piston pattern, and the only change was in the inserting of the double ribs, tying the bosses more securely to the piston head. The object in making these pistons was to give them a trial in aluminum, and not go to the expense of making up expensive patterns designed as shown in Exhibit 9, as these pistons were not to be used in the E. J. G. motor. They were installed for test purposes in a six cylinder Buda motor.

Q. 168. Who made the pistons? A. The castings were made at the Rockhoff Foundry in Mishawaka. They were machined up in the plant of the Amplex Manufacturing Company, and were installed in a motor in this plant.

Q. 169. Do you know who machined them? A. I do not.

Q. 170. Did you see them at any time between the time they were cast and the time they were installed in the motor? A. I did.

Q. 171. How many times? A. More than once; I don't know how many.

Q. 172. Had they been machined when you saw them? A. I saw them before they were machined, while they were being machined and after they were machined.

Q. 173. Who installed them in the motor? A. A man by the name of Hoadley, I think.

Q. 174. Did you see them installed? A. I did not, but saw the pistons sitting on the floor beside the car [65] when he was preparing to make the installation, but was not present when he put them in.

Q. 175. What was done with the motor after the pistons were installed in it? A. The car was taken out on the road and ran for a period of time until they were later removed.

Q. 176. How long, how far and at what speeds was the car run with these pistons in it? A. It was ran at various speeds up to sixty miles an hour, and at least a mileage of four thousand miles. It ran from about July until just prior to the receivership in November, 1914.

Q. 177. Do you remember any particular trip that you took with this car while these split pistons were in the motor? A. I took many trips: one to Chicago, and a number of times to various places in Indiana, on fishing trips.

Q. 178. What kind of a car was it? A. Amplex car.

Q. 179. You drove it yourself, did you? A. I drove it, and I owned it.

Q. 180. How do you fix the date when these pistons were installed in this car? A. I fix the date because it was in the summer of 1914 prior to the receivership.

Q. 181. That is, the Kamm receivership? A. Yes.

Q. 182. How did these Exhibit 11 pistons operate in the car? A. They operated perfectly up until just prior to the time at which they were removed. They were removed because the piston pins had pounded themselves loose in the piston bosses.

Q. 175. At what clearances were the Exhibit 11 pistons fitted in the cylinder walls? A. It would be impossible to state the exact clearance, but they were fitted just as close as they could be gotten into cylinders without driving them in; by this I mean, the fit was as close at they could be forced in by hand.

Q. 176. Did you see the pistons then or after they were removed from the motor? A. I did.

Q. 177. What was their condition? A. They were in perfect condition as far as the exterior was concerned, the only defect being in the piston pin bosses.

Q. 178. No scoring or cutting? A. None whatever.

Q. 179. The defect was not due to the slitting, was it? A. It was not. [66]

Q. 180. To what was it due? A. It was due to the fact that the piston pin bosses were too light, and also that the piston pins were not properly fitted.

Q. 181. Who removed the pistons from the motor? A. I do not know.

Q. 182. Of what material were the pistons made? A. Supposed to be of manganese aluminum.

Q. 183. Why do you say they were supposed to be manganese aluminum? A. Because manganese aluminum was being experimented with at that time for that purpose and Mr. Rockhoff advised that is what he used.

Q. 184. As a result of your examining the pistons, what kind of material would you say they were made of? A. I would say aluminum without making an analysis.

Q. 185. Did the pistons slap any while in use? A. They did not.

Q. 186. What became of these pistons? A. They were there until the time of the receivership; after that I do not know what became of them.

Q. 187. How many people knew about the making and use of these 1914 Exhibit 11 pistons? A. There was not more than I should say ten employees in the factory, and would say that the only people who were really familiar with them were the people who did the machining and installing. The balance of the employes probably knew something about it.

Q. 188. You have spoken of the Kamm receivership; will you state when this occurred, and briefly the circumstances under which it occurred? A. The receivership took place in November, 1914, and was brought about by the inability of the Amplex Manufacturing Company to retire a bond.

Q. 189. Will you state your reasons for not at that time making more pistons like the Exhibit 11 pistons? A. The Amplex Manufacturing Company at the time these pistons were made were strictly engaged in disposing of automobiles made prior by the Amplex Motor Car Company. There were no Amplex motors for these cars, and in disposing of them they were equipped with standard Buda six cylinder motors, and it was not the intention of installing these pistons as shown in [67] Exhibit 11, to use them as regular product. It was merely for experimental and demonstrating purposes.

Q. 190. I believe you said you were busy during the latter part of 1914 and the first part of 1915 in trying to get back the Amplex Company, and then became engaged in the—in your present employment, and that, in the meantime, in 1915, you had submitted your piston to the Buda Company and thereafter and in the first part of 1916 to the Packard Company; when was the deal by which your invention was assigned to the Packard Company consummated? A. I don't remember the date.

Q. 191. You had negotiations with Mr. Tibbetts, with Mr. Rector, with Mr. McCauley and various other people between March, 1916, and the consummation of the deal with the Packard Company, did you not? A. I did.

Q. 192. Will you state as near as you can recollect the date of each of these conferences, with whom the conferences were had, for what purpose they were held, and what was the result of the conferences? A. From the time I turned the various exhibits over to Mr. Tibbetts and until the time the deal was finally closed I had

a number of conferences with—through Mr. Pond and with Messrs. Rector and McCauley. I was in and out of Chicago on these conferences at various times during the period, but cannot give the dates; and these conferences were in relation to the sale of the exhibits as well as various other patents. As some of these other patents were held by Kamm, the receiver, I was delayed considerable in rounding them up and in securing them for Packard Company. This delay, of course, held up the whole deal for a considerable period of time.

Q. 193. I now hand you a file of correspondence; will you state whether or not you wrote any of these letters? A. I wrote all letters bearing my signature.

Q. 194. The other papers are copies of letters addressed to you; did you receive such letters? A. I did.

By Mr. Richey: The letter dated March the 27th, 1916, corresponds to the copy referred to heretofore as Gulick's Exhibit 3. The carbon copy is offered in evidence as Gulick's Exhibit 3. The [68] other letters are offered in evidence as Gulick's Exhibits 12, 13, 14, 15 and 16 respectively. They will further be identified by Mr. Tibbetts.

Q. 195. If these letters refresh your recollection as to any of the events which transpired during your negotiation for the sale of your piston invention to the Packard Company which you have not already related, will you refer to them and tell us about them? A. As I previously stated, in attempting to close the transaction with the Packard Company, a proposition was first made to them in which Exhibit 1, with the various other exhibits, were to be purchased. While these negotiations were pending a number of patents were in possession of Kamm, the receiver, which they wished to dispose of. They approached me on the subject, and I advised the Packard Company I could secure a number of these old patents. However, when the time came for the Kamms to deliver there was two or three of the patents that they did not want to dispose of, which they had originally agreed to let me have. Not being able to deliver these, as per my statement to the Packard Company, after the proposition had been made covering the whole number of patents, it was necessary to revise the deal with the Packard Company. Even then the deal did not then go through as planned, owing to the fact that the Kamms again changed their mind as to the number of patents they were to turn over to me. This condition existed

for some time, until the final settlement and turnover of the patents from the Kamm Company to me made it possible to close the deal.

Q. 196. Are the facts stated in these letters correct? A. They are.

Q. 197. Was the twenty-nine hundred dollars referred to in Mr. Tibbetts' letter of March the 27th placed in Mr. Rector's hands for you in the spring of 1916, to be paid to you contingent upon your being able to deliver with a clear title the patents and inventions set forth in that letter? A. It was.

Q. 198. State whether or not you knew it, in the spring of 1916? A. I knew it, as I was so advised by Mr. Pond, that they were ready to take it over. [69]

Q. 199. Had you disclosed the piston shown in Exhibits 1, 2 and 9 to the Packard Company, or any of them, prior to March, 1916? A. I had.

Q. 200. Which one? A. Mr. Tibbetts.

Q. 201. Which one of the Exhibits 1, 2, or 9? A. I—prior to March I had not shown Mr. Tibbetts Exhibits 1, 2 or 9, but I had talked with Mr. Tibbetts about the split piston, and also the motor, as I was trying to interest him in taking them over. Shortly after or about the time at which I closed my suit with the Packard Company in 1915 I had lunch with Mr. Tibbetts in the Auditorium Hotel, Chicago, and explained to him the piston and motor. At that time he was not particularly interested, but took it up with the Packard engineers, and later, about March 1916, we got together and that is the time that I turned over the Exhibits 1, 2, 9 and 10 to the Packard Company.

Q. 202. Had you, prior to March, 1916, sent a print like Exhibit 9 to the Packard Company? A. I might have done so; I do not know; if so, there would be some correspondence evidencing same.

Q. 203. Can you tell from the letters when the deal with the Packard Company was closed? A. No.

Q. 204. You were hired by Fred C. Robie to work for the Excelsior Company, were you not? A. I was.

Direct Examination Closed.

Cross Examination by Mr. Kingsland.

XQ. 205. Mr. Gulick, do you know who prepared the application upon which you are involved in this interference? A. Mr. Tibbetts.

XQ. 206. Did you furnish him the date upon which the application was prepared? A. None other than has been shown in Exhibits 1 and 2.

XQ. 207. In addition to that, had you had any personal conferences with him before the application was prepared? A. Only such conferences as were had pending our negotiations.

XQ. 208. Do you recall, whether upon any of these conferences, you gave to Mr. Tibbetts any information relative to the subject matter of the invention that would supplement or add to the disclosures of Exhibits Nos. 1 and 2? A. I have no recollection of such [70] disclosures.

XQ. 209. Then so far as you now remember the only information relative to the invention of your application given to Mr. Tibbetts was the contents of Exhibits 1 and 2, is that correct? A. The contents of Exhibits 1 and 2 and 9.

XQ. 210. You desire, then, to correct your answer to XQ. 206 and add thereto Exhibit 9 as the extent of disclosure to Mr. Tibbetts, is that correct? A. Yes.

XQ. 211. To summarize the matter then, Mr. Tibbetts, so far as you now remember, had before him Exhibits 1, 2 and 9, without any further information or without any other disclosures when he prepared your application, is that correct? A. It is not correct. Mr. Tibbetts had in his possession at the time Exhibits 1, 2, 9 and 10, from which he undoubtedly prepared the application. However, during the preparation of this application, I did not have any conference with Mr. Tibbetts.

XQ. 212. I understand from your last answer that you now desire to supplement or change your answer to XQ. 210 by adding Exhibit 10 thereto, is that correct? A. My first answer in reference to Exhibits 1 and 2 I was referring particularly to the written explanation in Exhibit 2 and not to all of the exhibits that were in his possession.

XQ. 213. Have you now stated all of the data that was before Mr. Tibbetts, so far as you now remember, at, before or during the preparation of your application?

Objection by Mr. Richey: Objected to as incompetent unless the witness was present when Mr. Tibbetts prepared the application.

A. All of the written data that I know of, written or printed data that I know of.

XQ. 214. Do you know of any verbal data or information that Mr. Tibbetts had from you in addition to the written or printed data at the time stated in the last preceding question? A. None other than might have come up in verbal conversation before or at the time I turned the exhibits over to him.

XQ. 215. But I understand from your answer to XQ. 208 that you have no recollection of giving to Mr. Tibbetts any additional verbal information in [71] relation to the invention, is that correct? A. I have no recollection of having talked with Mr. Tibbets or seeing him after turning over the exhibits until he forwarded the application to me for my signature.

XQ. 216. Did you give to anyone connected with the Packard Company any verbal explanation in addition to the Exhibits that you have referred to in further or fuller explanation of the invention prior to the receipt of the application papers for your signature? A. I did not.

XQ. 217. Mr. Gulick, do you understand the subject matter of the counts involved in interference No. 49,569 and 49,570.

By Mr. Richey: Let the record show that counts have not been shown to the witness by examining counsel.

By Mr. Kingsland: The witness is privileged to examine the counts.

By Mr. Richey: We object to the question as incompetent; it is not the function of the witness to interpret the counts.

By Mr. Kingsland: The witness is produced apparently to establish his dates of invention, has made preliminary statements, and is assumed to be familiar with the subject matter of the invention.

By Mr. Richey: We produced the witness to prove the facts he has testified about, and not to interpret the counts. That is the function of the tribunal who reviews this record.

A. Not having seen them before, and not understanding the terms in which they are set forth, I do not understand them.

XQ. 218. Will you refer to Exhibit No. 1 and indicate what you consider are the "means for joining the bosses and the cylinder engaging parts together," which is stated in the language Count 2 of interference number 49,569? A. In Exhibit 1, ribs 3 and 4 are the members which unite the bosses, skirt and the head.

XQ. 219. Will you please point to such language or other information contained in the Exhibits 1, 2, 9 and 10 that you have mentioned that characterize these means that you have just mentioned as resiliently yieldable? A. The ribs or webs 3 and 4 and the skirt 2 are [72] yieldable to an extent sufficient to perform service for which they are designed.

XQ. 220. Where is this information found in the exhibits that you have referred to? Namely, Exhibits 1, 2, 9 and 10. A. In Exhibit 1 it is shown by the ribs 3, 4 and the skirt 2; in Exhibit 9 it is shown in the ribs and skirt, the same as in Exhibit 1; in Exhibit 10 the same structure ribs are shown as in 1 and 9, the mechanical details, however, being more refined in 9 and 10 than in sketch Exhibit 1.

XQ. 221. Does your written description in Exhibit No. 2 give any information as to the yielding characteristics of the ribs 3 and 4?

Recess until 2:00 o'clock P. M.

By Mr. Richey: Notice is given that we will call as a witness Mr. Harvey Williamson of Elkhart, Indiana, who was referred to by Mr. Gulick.

A. It does. In paragraph 1, Exhibit 2, it reads, "Body 2, which provides bearing surface and which is split as indicated by 7 to provide for expansion." And in paragraph 2 it reads, "Body 2 is machined as close to sides as is possible to make a fit, and any expansion is taken up by the slot 7." Were it not for the slot 7 the heating up of the body of the piston would expand it to such an extent, if fitted as close to the cylinder as is mentioned in Exhibit 2, and cause it to seize. The slot provides for the skirt to close up. In other words, the slot makes possible a degree of flexibility in the structure which would not exist were the body of the piston made solid. It is a well known fact that all metals are inherently flexible, and it is obvious that a piston of this structure could not be otherwise than to a degree flexible. All pistons for engines when finished sized, even though they are not split, are flexible. They cannot be contracted under their normal size at the temperature at which they are finished, but will expand beyond that size. However, they may be perfectly round, but can be taken in the hand and with a slight pressure, thrown out of round a very few thousandths, which would evidence that all structures of this nature are to some degree flexible.

However, this flexing does not provide for the amount of contraction necessary for a piston to run free if [73] fitted as close as would be fitted with a split skirt. I further refer to Exhibit 9, which reads, "Design of piston which automatically provides for expansion and contraction." Also reads, "which is ideal construction for aluminum piston, as expansion is taken care of without excessive clearance." Withot the slot it would be impossible to fit the pistons as close as they may be fitted with the slots. Therefore it is obvious that a degree of flexibility sufficient to care for the operating requirements exists, and which is one of the prime objects in the invention.

XQ. 222. When you say in your last answer that it is obvious that a degree of flexibility exists, does this necessarily mean that the flexibility exists in the ribs as well as in the skirts in pistons of the type shown in Exhibit 1? A. It does.

XQ. 223. Was it your intention to disclose in the application upon which you are involved in this interference the same invention as was disclosed in Exhibits 1, 2, 9 and 10? A. The application for invention I presume was drawn from these exhibits. I did not draw up the application and did not draw up the specifications. The disclosure in Exhibits 1, 2 and 9 fully cover the object of the invention.

XQ. 224. At the time you prepared Exhibit No. 2 did you know of the manner in which the ribs would flex as described by you in your answer to XQ. 221? A. I did, from an engineering standpoint. I knew in which direction they would flex.

XQ. 225. Did you consider the requirement that the ribs would flex in order to perform the objects and function of the structure shown in Exhibit 1 was essential?

Objection by Mr. Richey: In asking the witness for his opinion counsel makes the witness his own.

By Mr. Kingsland: The witness has on direct examination presumed to express opinions as to the functioning of the device and the examination in relation to the functioning is entirely proper as purely cross examination.

A. I knew of necessity the ribs would have to flex in some degree to permit of the skirt closing.

XQ. 226. What explanation have you for failing to directly mention the flexible characteristic of the rib [74]

when you prepared Exhibit 2? A. I did not consider that it was necessary to attempt to patent an ordinary piece of material, cast iron or aluminum, inasmuch as the material used in these structures was inherently flexible. I further did not know it was possible to patent an inherently flexible metal or material, as far as the flexible feature is concerned. The construction of these pistons, and the slotting, automatically provides, in connection with the flexibility of the material, for the difference in degree of expansion.

XQ. 227. Do you consider it essential, and did you so consider it at the time you prepared Exhibits 1 and 2, that the skirt should be slotted in order to carry out the objects of the invention? A. Yes.

XQ. 228. Do you recall the circumstance of the execution of the application by you upon which you are involved in this interference? A. I do. But I do not recall the readings in the application exactly, but do know what they purport to express. These application papers were only in my possession for my signature, mailed to me from Detroit from the Packard Motor Car Company and were returned to them. I have never seen them since, or a copy.

XQ. 229. Did you read the specification and examine the drawing before you signed it? A. Yes, I read it. But I do not recall now how it read; or, in other words, the wording of the application.

XQ. 230. At the time you signed it did it express, in your opinion, the accurate disclosure of the invention? A. Yes.

XQ. 231. Referring to Exhibit 1, what elements designating them by the number used on the exhibit, forms the connection between the piston pin bosses and the skirt of the piston? A. Ribs 3 and 4.

XQ. 232. What do you understand the word "rigid" to mean?

By Mr. Richey: This line of examination is not germane to the direct examination and counsel makes the witness his own; moreover, the witness is being asked to interpret the claims and specifications which is the function of the patent office, and objection is made to the question on that ground also. [75]

By Mr. Kingsland: The witness has testified that the specification expressed an accurate disclosure of the invention. Obviously counsel has a right to inquire as to the witness' understanding of the use of language in the specification.

A. Rigid, absolutely immovable, absolute inability to flex.

XQ. 233. I will now ask you to consider the language appearing in the third paragraph of page four of your original specification that reads as follows:

> "It will be seen that in addition to providing a piston with a split skirt, the above described construction also provides an extremely rigid connection between the piston pin bosses and the skirt of the piston, which construction may be used either with or without the split skirt and separated head."

Do you consider that the above language accurately describes or discloses the invention as shown in your Exhibit No. 1 and described in your Exhibit No. 21 (Counsel hands witness certified copy of the Gulick file-wrapper contents which witness examines.) A. It does describe the invention and the fact that the ribs are mentioned as rigid between the piston pin bosses and the skirt does not detract from the flexible feature, owing to the fact that it was quite necessary that a rigid structure or as near so as possible be incorporated in the direct line of thrust sidewise for the connecting rods. The ribs in connection with the piston and the bosses and as attached to the head when the piston was flexed or closed at the slot would flex more or less between the head and the bosses. The skirt body would flex between the ribs, permitting it to close at the slot, and the ribs would close in; they would not flex to any perceptible degree lengthwise of the rib across the piston.

XQ. 234. I will now ask you to examine the entire original specification and point out such language therein as you consider justifies the theory of operation given in your last answer. A. I will not attempt to interpret the language of the specification. However, I see nothing in this specification that does not describe the invention and its relations to a split piston providing for expansion and contraction. [76]

XQ. 235. In answer to XQ. 227 you said that you considered the slotting of the skirt an essential in order to carry out the objects of the invention. In the language that I quoted in XQ. 232 it was stated that the structure may be used either with or without the split skirt. Did you consider it accurate to set forth in the specification that an operative structure could be made to accomplish the object of the invention without a split

in the skirt? A. The structure shown, that is, the interior ribs, could be incorporated in the piston without the split skirt. However, in such case it would not be flexible. With the split skirt, the structure becomes flexible as shown in Exhibit 1 and as expressed in the application.

XQ. 236. Has the thickness of the ribs anything to do with the flexibility thereof, I am referring of course to a piston such as shown in Exhibit No. 1? A. The thickness of the ribs would have some bearing on the degree of flexibility; by that I mean, the thinner the section of rib the less would be the tension, and the thicker the rib the higher would be the tension and less susceptible to easier degrees of flexibility.

XQ. 237. If the metal of the ribs were made of such a thickness that the cylinder wall pressure failed to overcome the rib tension would the piston seize? A. If it were a rib sufficiently heavy that there was absolutely no flexibility in a direction parallel to the piston head, the structure would then be in that direction rigid, and if fitted to the cylinder as closely as permitted by the flexible structure as in the application, it would undoubtedly score on the sides adjacent to the end of the piston pins. However, the split in the skirt between the ribs would afford relief for that portion of the skirt, but could not afford relief for the sides of the piston adjacent to the pin, and by this explanation I mean a rigid structure parallel with the piston pin.

XQ. 238. When you talked with your wife about this matter did you explain to her the fact that the ribs would be flexible, or did you stop short of that full explanation? A. I explained to her fully that the structure of the skirt and ribs below the head were of a flexible nature. [77]

XQ. 239. But you failed to make this explanation, so far as you remember, as I understand your testimony, to Mr. Tibbetts or anyone connected with the Packard Motor Car Company, is that correct? A. I cannot say that I mentioned the word "flexible" in connection with this design to Mr. Tibbetts. I do not know. However, it might have been mentioned in some of our talks prior to my making the deal with them and turning over the papers. I did not mention it to anyone else connected with the Packard Company. The structure in itself evidences its flexible nature.

XQ. 240. On your direct examination you stated that you made the first set of pistons following Exhibit No. 1 for a motorcycle motor. Did those pistons vary in any detail from the showing of the Exhibit No. 1? A. They did.

XQ. 241. Please describe the differences between the showing of Exhibit No. 1 and the pistons that you made for the motorcycle motor. A. The pistons used in the motorcycle motor were constructed the same as Exhibit No. 8, and were made from a standard Excelsior motorcycle piston.

XQ. 242. They had no flexible ribs connecting the bosses with the head and the bosses with the skirt, had they? A. No, the flexation was entirely in the skirt.

XQ. 243. When you answered Q. 20 you stated that you made a set of pistons of Exhibit No. 1. In view of your last answer do you consider your answer to Q. 20 accurate and a fair statement of the facts? A. The answer to Q. 20 is an error. This is the correct answer to Q. 20: None other except that we made a set of split pistons for a motorcycle motor which was block tested to be used in a racing motor prior to the official opening; further, the pistons used in this test were of the standard racing type and were split to develop the split skirt idea, but were not ribbed exactly as shown in the sketch.

XQ. 244. Was it your custom to date sketches of inventions devised by you prior to 1911? A. It was.

XQ. 245. Did you have any reason for omitting the date on Exhibit No. 1? A. None whatever. The [78] specifications, however, Exhibit 2, I had not quite completed, and it is probably the reason why the date was not affixed.

XQ. 246. In your answer to Q. 34 you mentioned a suit against the Packard Motor Car Company. What was the general nature of that suit, and where was it pending? A. It was a suit against the Packard Motor Car Company for royalties on rear axle structures and the suit was filed in Chicago.

XQ. 247. In your conferences relating to the transfer of your inventions to the Packard Company, did you confer with anybody connected with that company other than Mr. Tibbetts? A. No one directly connected with the company but Mr. Tibbetts.

XQ. 248. During the prosecution of the application upon which you are involved in this interference, after

it was filed, did you confer with Mr. Tibbetts concerning the subject? A. I have no recollection of any correspondence or any consultation on the subject after it was filed. However, he may have brought up some question, and not having preserved Tibbetts' letters, I do not know.

XQ. 249. Did you authorize any amendments in the case after it was filed? A. I do not know that I did. That is, I don't remember.

XQ. 250. Did you have anything to do with the transfer of the application from the Packard Company to the present owner? A. I did not.

XQ. 251. When did you first learn that claims in the case were directed to the flexible feature of the rib? A. I don't know that the question of the particular flexibility of the ribs was brought up until this deposition was being taken.

XQ. 252. Before that time you did not consider the particular flexibility of the ribs as part of your invention, as I understand it, is that correct? A. I did not consider the word "flexible ribs" inasmuch as the general structure shown in the application shows—indicates a flexible structure in relation to the split skirt.

XQ. 253. In answer to XQ. 226 you stated that you did not think it possible to patent an inherently flexible metal or material, was this the reason that you did not mention to Mr. Tibbetts the flexible characteristics [79] of the ribs? A. I think Mr. Tibbetts was as well aware of the flexible nature of the structure as I was, and I do not think that it occurred to him or anyone else to attempt to cover an inherently flexible material. The structure in itself provides all the necessary flexibility.

XQ. 254. Were you of the opinion in 1922 that the flexible characteristic of the rib was merely an inherent quality of the metal out of which they were made? A. I was always of the opinion that the design of the structure in connection with the flexibility of the material was all that was necessary to produce a proper working piston. It is necessary that the material be flexible; if not, when the piston skirt was closed it would stay in that position and be of no further use. It must be flexible to conform to the uses to which it was put.

XQ. 255. Did you at any time during the prosecution of the application examine any of the amendments that were filed? A. I do not know that I did.

XQ. 256. Will you say that you did not? A. I will not state that I did not or that I did. I do not know.

XQ. 257. I refresh your memory by referring you to a photostat of a supplemental oath filed as a part of your application and dated November 8, 1922, and will ask you whether this recalls any circumstances connected with the prosecution of the case? A. It recalls no circumstances, but I did execute the supplemental oath. However, it had slipped my mind, having no record that I did so.

XQ. 258. In this oath you state that you had read the application as it stands amended after the filing of the amendatory paper filed September 11, 1922. Do you recall any circumstance of reading the amended application? A. None except that I probably read it over and signed it and returned it.

XQ. 259. In your last answer, when you say "it" do you mean your supplemental oath? A. Yes.

XQ. 260. You have no independent memory of examining any other papers at that time? A. No.

End of Cross Examination by Mr. Kingsland.

It is agreed by all the parties that the balance of Mr. Gulick's testimony may be taken stenographically by Mr. Batson and written up by him. [80]

Cross Examination by Mr. Fletcher.

XQ. 261. In your answer to Q. 13 you have stated that in addition to showing and exhibiting Exhibit No. 1 to your wife, you also disclosed it to one or two other parties. Do you now recall who the other parties were? A. They were friends of mine who lived in the immediate neighborhood.

XQ. 262. Can you give their names? A. I can give their names, but it don't seem to be warranted; the idea is, two of them were women.

XQ. 263. What are their names? A. One was Mrs. Smith and the other, Mrs. Grubb. Their husbands also visited my house on numerous occasions and knew of it, but not sufficiently familiar with it to be able to testify.

XQ. 264. Two of them—both of them? A. Yes.

XQ. 265. Did you disclose Exhibit No. 1 to the husbands of these women? A. I believe I did, yes.

XQ. 266. Prior to 1911 was it customary with you to have sketches and the like which you disclosed to

others attested or witnessed by such others? A. Sometimes I did and sometimes I did not.

XQ. 267. Is Exhibit No. 1 the basis used in the preparation of your application for letters patent, and in which application the counts of the interferences are involved?

By Mr. Richey: Objected to as incompetent; the application itself is the best evidence.

A. It is probable that Exhibit 1 and Exhibit 9 were used in the preparation of the application.

XQ. 268. Was Exhibit No. 2 used in the preparation of the application? A. I don't know; but I expect it was.

XQ. 269. In the last paragraph of Exhibit No. 2 it is stated:

"The head, 1, is machined small enough to allow for expansion and not bind or seize, while the body, 2, is machined as close to size as is possible."

Do you recall whether this statement was made in your application filed in November, 1917? [81]

By Mr. Richey: Objected to; the application itself is the best evidence.

A. I do not know.

XQ. 270. At the time that the Excelsior Company was preparing for the races at the motordrome at Chicago and you were making a piston to go into the motorcycle motors to be used in the races, what type of a piston were you working on at that time? A. It was a standard type motorcycle piston, split the same as Exhibit 8, practically the same as Exhibit 8.

XQ. 271. Where were the pin bosses disposed in the piston like Exhibit 8? A. In about the same position below the ring head as in Exhibit 8, in the same position.

XQ. 272. Then they were extended from the skirt of the piston? A. They extended inwardly from the skirt of the piston.

XQ. 273. In your answer to Q. 20 you stated in part: "Were not ribbed exactly as shown in this sketch."

The Witness: In "the" sketch or in "this" sketch?

Mr. Fletcher: This sketch.

XQ. 274. Where were these ribs disposed and how, with respect to the piston, Exhibit No. 8? A. There was one small rib extending from the head down to the piston pin boss, and two very slight projecting ribs extending partially around the piston from the pin bosses.

XQ. 275. Were there any ribs extending transversely from the pin bosses to the skirt? A. No. Now, I don't know what you call transversely in this case. Look at it yourself. That is an entirely different thing. That doesn't extend down.

XQ. 276. I mean transversely, something like that —that is not Exhibit 8, is it? A. No.

By Mr. Richey: It is requested that the piston produced by the witness and referred to in the preceding answer be marked for identification, Gulick Exhibit 17; and it is so marked. [82]

XQ. 277. My previous question was directed to Exhibit No. 8. Were there any ribs extending transversely from the pin bosses of Exhibit No. 8? A. Not like the ribs shown in Exhibit 1. Exhibit 17 shows the interior construction of the ribs.

XQ. 278. When was the first time you made a piston like the disclosure of Exhibit 1? A. First piston made of practically the same structure as in Exhibit 1 was—patterns were made from Exhibit—patterns and castings were made from Exhibit 9. The piston, however, never was machined or finished. In the year of 1914.

XQ. 279. With respect to the type of piston you have described as the Renault, Exhibit No. 8, as you have stated that some of them were put in a motor and used in the motor races at Elgin, Illinois—was the motor races well patronized? A. They were.

XQ. 280. Were you there from day to day? A. I was there one day.

XQ. 281. Then you only speak of the races being patronized for one day? A. That is all. The day on which I was there with the Renault. The Renault, however, was not driven in the races; it was driven to the races, to visit the races, from Chicago, and return, in one day.

XQ. 282. How far did you state that these Renault pistons like the Exhibit No. 8 were operated as to mileage of an automobile driven by the motor in which the pistons were mounted? A. Why, I believe I said some-

thing around possibly three or four thousand miles; I don't just remember. It was driven fully that much; might have been more.

XQ. 283. The longest trip that you took was that in which Mr. Williamson was along, was it not? A. It was the longest single trip.

XQ. 284. In your answer to Q. 110 you stated, "in the latter part of 1908," with reference to conceiving the idea in Exhibits 1, 2 and 8. Can you further state, in more detail, as to what the idea was? A. The idea was to simply split the skirt, practically the same as [83] shown in Exhibit 8. But it wasn't practical to use in a two cycle motor, and was not used because we didn't build four cycles.

XQ. 285. Were all of your ideas on splits at that time the same as that shown in Exhibit 8, in which the diagonal slot extends into the transverse slot? A. That was the general idea of the split construction.

XQ. 286. Was this your car that the pistons of the type Exhibit 8 were mounted in at the time of the Elgin races? A. It was not.

XQ. 287. Who did the car belong to? A. Belonged to the Excelsior Motor Manufacturing Company.

XQ. 288. What type of a car was it—touring or closed car? A. Five passenger open touring type car, Renault type of design.

XQ. 289. Was the car used in connection with the Excelsior Company's business? A. It was.

XQ. 290. How long did you say that the car was used at the time that the motor had the pistons of the type shown in Exhibit 8? A. From just prior—the day prior—from the day of the Elgin races, until shortly after the first of October in 1911.

XQ. 291. How many pistons did you make of the type shown in the sketch, Exhibit No. 11? A. There was possibly fifteen or eighteen castings made of this type before we succeeded in getting enough sound ones to make six good pistons, and one extra.

XQ. 292. When were those pistons cast? A. Well, they were cast prior—these were cast, I should say about July, 1914; along about the first of July, 1914.

XQ. 293. And those that were machined, were they machined shortly thereafter? A. They were machined as fast as they were cast until we got enough good ones. Exhibit 11, however, is not a drawing of the piston; it is merely a sketch showing the type of construction.

XQ. 244. Did you have another drawing of the piston? A. No drawing was ever made of the piston.

XQ. 245. Then Exhibit 11 was the first sketch or drawing made, is that correct? A. No. There was a sketch made of the bosses and how they were to be incorporated in a piston pattern which was either [84] owned by the Amplex Motor Car Company or by the Rockhoff Foundry. There was no drawing made of the piston, as it was a standard type; merely a sketch of the bosses and how they were to be placed in the piston, the machining of the rings and so forth. Overall dimensions and otherwise were copied from a Buda piston, and the slotting was done by merely an explanation as to how they were to be slotted.

XQ. 246. When was this sketch which you have just mentioned made? A. Oh, it was made probably sometime in June, the latter part of June, 1914, about the time the pattern was fixed up and the castings made; only possibly two or three days was required to do the whole job.

XQ. 247. Was the Buda piston which you have just mentioned slotted? A. It was not.

XQ. 248. In Interference No. 49571, count one thereof, it states in part:

> "A tying means extending from each of said wrist pin bearings, each being cooperably connected at their opposite ends to said cylinder engaging portion."

Can you describe this construction on Exhibit 1?

By Mr. Richey: Objected to as not germane to the direct examination, and as asking the witness to execute the function of the patent office.

A. On Exhibit 1 it would be shown as ribs 3 and 4, tying the pin bosses to the skirt of the piston.

XQ. 249. Can you describe what is meant by the cooperable connection of the tying means with the skirt, with respect to Exhibit 1?

By Mr. Richey: Same objection; counsel makes the witness his own.

A. I hardly know how to express this cooperable connection, unless it was where the rib was connected to the skirt of the piston, and independently, each rib being independent of the other rib.

Adjournment at 5 o'clock until 9:30 o'clock tomorrow morning. [85]

Friday, July 23, 1926; 9:30 o'clock A. M.
Deposition resumed.

XQ. 250. By your answer to Q. 23, I take it, then, that you never made a piston like that disclosed in Exhibit No. 1 at that time, is that correct? A. We made the piston patterns and the castings, but we never machined them up.

XQ. 251. But the time you have reference to in your answer to Q. 23 is the year 1911? A. Yes; that answer to Q. 23 is 1911. But, now, in this one back of this, was that referring to Exhibit 1 or Exhibit 9?

XQ. 252. Exhibit 1. A. I want to get back to that question then.

The notary reads XQ. 250.

A. I never made a piston in 1911 like Exhibit 1, as far as the rib structure is concerned. The piston made in '11 and referred to in Q. 23 was a standard type slotted, the same as Exhibit 8.

XQ. 253. In your answer to Q. 42 you stated that you did not recall showing Exhibit 2 to anyone but your wife prior to showing Exhibit 2 to Mr. Offield, whereas in answer to and XQ. you stated that you showed it to two other parties. Which of these answers is correct? A. In showing it to my wife, she was the only one that was familiar, by my explanation, with its construction. The other parties mentioned, being neighbors, saw it, as previously stated, but were not qualified to understand it. For that reason, in my first answer I did not mention them. I had forgotten the circumstances.

XQ. 254. In your answer to Q. 73 you stated with reference to Exhibit 8 that they were made in 1911. Was this the first time you made a piston having a slotting of the character shown in Exhibit 8? A. No.

XQ. 255. When was the first time you made a slotting of the character shown in Exhibit 8? A. The motorcycle piston that was made in 1911 was slotted prior to Exhibit 8.

XQ. 256. How much prior to the slotting of Exhibit 8? A. I don't know the exact number of days.

XQ. 257. In your answer to Q. 73 you stated it was in July, 1911, that pistons like Exhibit 8 were made. [86] Does this refresh your memory as to when others were made prior to this date? A. Exhibit 8 was made in

July, and the motorcycle piston of similar construction was made earlier; was made before Exhibit 8.

XQ. 258. But it was in 1911, wasn't it? A. It was in 1911.

XQ. 259. Which of the original drawings of Exhibits 9 and 10 were made first? A. Ten was made first.

XQ. 260. As I understand it, the original drawings of Exhibits 9 and 10 were made after you and Mr. Pulsifer took over the Amplex Company from the receiver, is that correct? A. The drawings were started prior to our taking over the Amplex plant, as negotiations were not completed until about May, 1914, and draftsmen were working on this type prior to the closing of the negotiations.

XQ. 261. Where were the original drawings made of Exhibits 9 and 10? A. Made in the plant of the Amplex—They were started in the plant of the Amplex Motor Car Company, Mishawaka, Indiana, and finished in the plant of the Amplex Manufacturing Company, same place.

By Mr. Richey: Same plant?

The Witness: Same plant, in 1914.

XQ. 262. After the receivership of the Amplex Motor Car Company in 1914 you have stated that you sent Exhibit 9 to the Buda Company, and that later you corresponded with the Buda Company for the return of Exhibit 9. Have you any of the correspondence had between you and the Buda Company with respect to the return of Exhibit 9? A. I have not.

XQ. 263. Did you have any correspondence with them—that is, letters from the Buda Company? A. I did at the time.

XQ. 264. Then you do not know where said letters are, do you? A. I haven't the letters in my files. I presume, however, the Buda Company has copies of their replies to me, and possibly my letters.

By Mr. Richey: You searched for your files, did you?

By the Witness: I haven't any. Exhibit 9 indicates that the Buda Company received the [87] print, as it is stamped on the back, the date which they received it.

XQ. 265. In count 3 of Interference No. 49571 part of the language thereof reads as follows:

"And the skirt portion being split longitudinally of the piston to permit free expansion and contraction."

Can you, by referring to Exhibit 1, point out the elements that would permit the expansion and contraction of the skirt portion?

By Mr. Richey: In asking the witness to interpret the claims, counsel makes the witness his own.

A. Ribs 3 and 4 would flex or give to some extent above the piston pin in the narrow section shown in A which connects the bosses and the head. The skirt body, 2, would flex at the back side opposite the slot. Ribs 3 and 4 would also flex slightly. And the whole structure lends itself and adapts itself to a degree of flexibility. It was designed for that purpose.

XQ. 266. You have mentioned the ribs 3 and 4 which lead to the body portion or skirt 2, said ribs obviously forming a support to the skirt. Would not such connection of the ribs 3 and 4 to the skirt provide a reinforcement to the skirt? A. They would provide a reinforcement, but not a rigid reinforcement.

XQ. 267. But would they permit the skirt to be free? That is, so as to have free expansion, such as unrestrained expansion.

By Mr. Richey: Will counsel explain to the witness what he means by "unrestrained"?

By Mr. Fletcher: "Unrestrained" means where a part is free to act without being held back.

By Mr. Richey: The question is objected to as immaterial.

A. If the structure was of such a nature that it would expand or contract and not react it would be of no value.

Mr. Fletcher: That is all. [88]

Re-Direct Examination by Mr. Richey.

RQ. 268. During your cross examination you referred to the motor piston marked Exhibit 17. When did this piston come into your possession? A. I never saw this piston until yesterday, July 22nd.

RQ. 269. Day before yesterday Mr. McCoy wired for the piston and the blue print which I hand you and which I have marked by identification No. 18, did he not, and they were received yesterday noon? A. That is what I understand.

RQ. 270. The type of piston exemplified by 17 and illustrated by 18 is a type of motorcycle piston that the Excelsior Company was using in the first part of 1911, aren't they? A. Yes.

RQ. 271. About the time you made Exhibits 1 and 2? A. Yes.

RQ. 272. How do the proportions of the piston illustrated in Exhibit 1 compare with the proportions of Exhibit 17 and the piston illustrated in Exhibit 18? A. The overall dimensions are very close.

RQ. 273. That is, the actual dimensions or the proportions? A. The actual outside dimensions and general proportions, not considering the rib structure.

RQ. 274. I believe you stated it was your intention that the piston which you illustrate in Exhibit 1 was to be used in substitution for pistons like 17, and that illustrated in 18, is that correct? A. That is right.

RQ. 275. Now, you also said, I think, that it was pistons like Exhibit 17 that were modified by slotting them in 1911—that is correct? A. Yes.

RQ. 276. Will you mark on this piston, Exhibit 17, and on the drawing, Exhibit 18, how those pistons were modified?

(The witness marks said Exhibits with red pencil.)

A. That is close enough to show it, isn't it? I have so marked them with red pencil.

RQ. 277. At the bottom of Exhibit 9, below, the illustration of the piston, is the word "cast iron," and during the description it is stated that this is an ideal construction for aluminum. If the piston illustrated in [89] Exhibit 9 was made of cast iron or aluminum state whether or not the webs would be flexible and yieldable. A. They would.

RQ. 278. During your cross examination by Mr. Kingsland you were interrogated regarding your application. Will you look at the drawing of this application and state what would happen to the webs shown therein if the piston expanded? A. When the piston expanded naturally the circumference of the skirt would increase and the webs would flex slightly to meet these requirements.

RQ. 279. I call your attention to the statement at the bottom of page 3 of the specification, as follows:—

"In order that the skirt may not expand an undue amount when the piston is heated, as under

operating conditions, it is split longitudinally as at 21."

What would happen to the webs when the piston operated as described in the quotation which I have read from the specification? A. As soon as the skirt had expanded a sufficient amount to take up any clearance which might exist between the cylinder walls and the skirt, then the material would flex, then the structure would flex and the split would absorb the surplus expansion.

RQ. 280. By "structure" you mean the webs? A. Webs and the whole structure in connection with the skirt.

By Mr. Kingsland: Last question and answer objected to on the ground that it is leading, and move that it be stricken out.

RQ. 281. The specification further says that one of the objects of the present invention, "is to provide a piston which will not expand against the cylinder wall to such an extent as to seize or stick."

"Another object of the invention is to provide a piston with a skirt or guide portion slightly separated from the head of the piston and split longitudinally so that it will not expand in circumference with force great enough to cause the piston to stick in the cylinder." [90]

What would happen to the webs of the piston illustrated in the drawing of your application if it operated and realized these objects? A. As soon as the skirt had expanded to the cylinder walls as far as it could go the balance of the expansion would be taken up by the slot and necessarily the ribs would flex slightly between the head and the piston pin bosses; and also the ribs extending crosswise would flex to a very slight extent, sufficient to make the device operative.

RQ. 282. When Mr. Kingsland called your attention to the supplemental oath I think you didn't note that the same had been executed in Cuyahoga County, Ohio. Will you look at this oath now and state whether or not that fact refreshes your recollection as to the execution of the same or the consideration of the amendatory paper filed September 11, 1922? A. I, at the time of answering the question, did not recall having signed this paper, this amendment. However, when it

was brought to my attention, I did sign it in Cleveland, and I read it before I signed it or I never would put my signature to it, as I am not in the habit of signing any papers or attaching my signature until I read them. I signed this paper in Cleveland on November the 8th, 1922, the day on which I made sketch Exhibit 11, which was the only time I have been in Cleveland on this subject matter. I didn't give this subject much attention, outside of reading it over, as I was not so much interested in it as I was in the earlier developments of the piston. I had forgotten the circumstances.

RQ. 283. The Exhibit 9 refers to the E. J. G. motor. State whether or not that was adopted as standard equipment by anybody. A. It was adopted by the Amplex Manufacturing Company as standard equipment, and was intended to be used with the Amplex cars.

RQ. 284. And as standard equipment it was to include the piston shown in Exhibit 9, which you state was a part of it? A. It was.

RQ. 285. State whether or not patterns were made to make castings for the pistons shown in Exhibit 9. A. They were.

RQ. 286. When were they made, do you know? A. Castings were made in the—they were made after July, and a short time prior to the receivership. I just can't state the date. [91]

RQ. 287. Do you know who made them? A. I do not.

RQ. 288. Were any castings made from those patterns? A. There was.

RQ. 289. How many? A. Well, it was a six cylinder motor and there was some surplus castings made. I don't know just how many.

RQ. 290. Do you know who made them? A. I do not.

RQ. 291. Who made the patterns? A. The patterns were made in South Bend, were made here, by either the South Bend Pattern Works or the Peerless Pattern Company.

RQ. 292. When were the castings made? A. They were made sometime after July and prior to the receivership in November.

RQ. 293. What was done to the castings? A. Nothing. They were received at the factory but were never machined.

RQ. 294. Why not? A. Because of the receivership.

RQ. 295. Where are the castings now? A. I don't know.

RQ. 296. What was the purpose in making them? A. To put them in the motor, in the E. J. G. motor.

RQ. 297. To machine them up and put them in the E. J. G. motor? A. Yes, to machine them up and put them in the E. J. G. motor.

RQ. 298. You testified about your efforts to recover your company from the Kamm receivership. Will you state more in detail what you did after the receivership in November, 1914, in an effort to recover the company. A. Shortly after the receivership in November, 1914, Mr. Pulsifer and I were engaged in attempting to take it out of the hands of the receivership. Mr. Pulsifer consulted some attorneys in Chicago, and I consulted Mr. Graham of South Bend on the subject. We had no way of forcing them to accept our terms, and we attempted to raise enough money to buy it back, but times at that time, money was rather close and investors were not very fast in lining up with such a proposition. We worked on the subject and made ovations to Kamm, the receiver, and we visited him on several occasions up [92] until about April, 1915, and as we didn't succeed in getting anywhere, he finally advised us that he was going to operate the business, at least temporarily, which he did. We then ceased our attempts to finance it. And that was the end of it, as far as we were concerned.

RQ. 299. State whether or not you used any pasteboard in making the patterns for the pistons shown in Exhibit 11, and if so, how.

By Mr. Kingsland: This line of examination is objected to as clearly improper redirect examination; the last several questions have covered matters that should have been brought out in direct, if at all.

A. Pasteboard was wrapped aroupd the patterns to increase their size sufficient to machine, as the original pattern was slightly smaller than the bore of the Buda motor.

RQ. 300. You were asked during your cross examination about the piston of the patent application. I show you a piston which I mark for identification Exhibit 19. Will you state whether or not in your opinion this is a fair representation of what is shown in the patent application drawing and what is described in the application. A. It is.

RQ. 301. State whether or not that is in your opinion a fair representation of what you disclosed to Mr. Tibbetts. A. It is.

RQ. 302. State whether or not it is a fair representation of what is disclosed in Exhibit 9. A. It is.

RQ. 303. You were asked during your cross examination about that trip you and Mr. Williamson took. I show you a photograph which I have marked for identification, Exhibit 20. Will you state what this shows? A. This is a picture of the Renault type car which was owned by the Excelsior Motor Company and which was fitted with split type pistons. This picture was taken on the road when we were near Michigan City on a trip which Mr. and Mrs. Williamson and my wife and I made to Mishawaka in the latter part of September, 1911.

RQ. 304. Who were the people in the car, as shown in this picture? A. My wife in the front seat, Mrs. Williamson in the rear seat. The one on the left is my wife and the one on the right is Mrs. Williamson. [93]

RQ. 305. Have you read the counts of this interference and do you understand the same? A. I have and I do.

RQ. 306. Are you the inventor of the subject matter of the counts?

By Mr. Kingsland: The question is objected to as incompetent and calling for a conclusion of the witness.

By Mr. Fletcher: The same objection.

A. I am.

RQ. 307. Are you financially interested in the outcome of this controversy or any of them? A. I am not.

RQ. 308. I show you some drawings marked Exhibits A2 and A3 which I will have marked for identification, Gulick's Exhibit 21 and Gulick's Exhibit 22 respectively. What do these drawings show? A. These are right and left hand views of the E. J. G. motor and the same motor as shown in section in Exhibit 10. The prints might be somewhat confusing as both views were made from the original tracing, but it will be noted that the pump is shown as on one side and the magneto on the other.

RQ. 309. That is the motor that is referred to in Exhibit 9, isn't it? A. Same motor.

RQ. 310. When were those prints, Exhibits 21 and 22, made? A. Early part of 1914.

RQ. 311. You were asked during your cross examination regarding the Amplex car which you had in 1914. Did you look last night at your home for a bill of sale, showing when you purchased this car? A. I didn't look for the bill of sale because I didn't know that I had it, but as I had just finished papering our house I was putting some wall paper away in the garret and I ran onto a box that had some old wall paper and some letters in it, and amongst the junk was this bill of sale.

The paper referred to by witness as "this bill of sale" is marked for identification Gulick Exhibit No. 23.

RQ. 312. Will you refer to Exhibit 23 and state just what it is and what it covers? A. It was a bill of sale given to me by the Amplex Manufacturing [94] Company, signed by Mr. Randall, and covered the Amplex car which I purchased from the company at that date, July 16, 1914, and is the same car in which the split aluminum pistons were installed. This car was driven for several hundred miles prior to my purchasing it and the new pistons were in the car when I took it over on this date.

RQ. 313. Is there anything about the bill of sale which refreshes your recollection as to whether or not the pistons were in the car when you bought it? A. There is. They not being standard, I requested Mr. Randall to exhibit the mileage of the car and also the fact that there were other pistons in it; which he did.

RQ. 314. And what were those other pistons? A. They were split pistons, aluminum pistons.

RQ. 315. Like Exhibit 11? A. Like Exhibit 11, yes.

RQ. 316. Who made the red ink notations on this bill of sale, if you know? A. I don't know; either Mr. Randall or his assistant, I presume.

RQ. 317. This notation reads, "Miles speedometer 816; new type pistons in moto.," and on the back I find the following notation, "R. Fernegan. This mileage, 6112, when car was left in garage and was not driven but little after until Cook received it. E. J. Gulick." Who made the notation on the back of the bill of sale, Exhibit 23? A. I did.

RQ. 318. Do those notations refresh your recollection as to how far this car was driven with the pistons like Exhibit 11 in them? A. They do.

RQ. 319. Can you state nearer than you did before what was that mileage? A. The split pistons were taken out prior to the receivership sale in November, 1914, and the standard type Buda pistons inserted. I can not tell just how many miles it was driven after that before it was sold to Cook, but it was driven very little. So the mileage in which the split pistons were used would be the difference between the 816 indicated on the bill of sale and the time which they were removed. As the car was laid up nearly all winter I doubt if it was driven more than two or three hundred miles before the sale, and this would leave apparently around forty-five hundred miles or in that neighborhood of actual operation for the split pistons. [95]

By Mr. Richey: The motorcycle piston marked by identification Gulick Exhibit 17 is offered in evidence as Gulick's Exhibit 17.

The blue print of the same marked for identification Gulick Exhibit 18 is offered in evidence as Gulick Exhibit 18. The piston marked for identification Gulick Exhibit 19 is offered in evidence as Gulick Exhibit 19.

The photograph marked for identification Exhibit 20 is offered in evidence as Exhibit 20. The bill of sale produced by the witness and marked for identification Gulick Exhibit 23 is offered in evidence as Gulick Exhibit 23.

By Mr. Kingsland: The offer in evidence of Exhibit No. 19 is objected to on the ground that it is incompetent, the date of its structure not having been established and not having been connected in any wise with the subject matter involved.

By Mr. Fletcher: The offer in evidence of Gulick Exhibit No. 17 is objected to on the ground that it has not been identified for the reason that the witness said that he had never seen it before.

The offer in evidence of Exhibits 18, 19, 20 and 23 are objected to on the ground of being improper redirect examination.

RQ. 320. When did you make the notation on the back of the bill of sale, Exhibit 23? A. My recollection is this was made in the early part of 1915; at any rate, it was after Cook had purchased the car. That date I am not absolutely clear upon.

By Mr. Richey: Redirect examination closed.

Re-Cross Examination by Mr. Kingsland.

RX. 321. This Exhibit No. 11, in your opinion, does it embody the subject matter of the counts of these interferences?

By Mr. Richey: I object as incompetent. That is the function of the patent office.

By Mr. Kingsland: Counsel has interrogated this witness on the construction of the counts and has requested his opinion as to whether he is the [96] inventor thereof and has asked him to apply structure to the counts.

By Mr. Richey: The witness was cross examined as to certain matters, as a result of questions by which counsel made the witness his own, but he was not asked to interpret the counts.

By Mr. Kingsland: It is impossible to see how this witness could construe the counts and state that he was the inventor of the subject matter without involving a construction of the counts. The witness has not been made a witness for Hartog, but has been questioned on cross examination entirely within the scope of the direct examination.

By Mr. Richey: That part of the cross examination which asked for an interpretation of the counts and explanations of the terms of the counts and words in the counts had no bearing whatsoever on the direct examination, which related entirely to the facts, and counsel made the witness his own and now seeks to escape the responsibility of doing so.

A. It does to the extent of the functioning of the split skirt. However, in the structure it doesn't show or have the ribs of the same construction as shown in Exhibit 1.

RX. 322. Was there ever made a structure as shown in your application drawing that embodied the entire structure of the ribs supporting the bosses and the split skirt? A. There was.

RX. 323. When was that made? The castings were made in the fall of 1914.

RX. 324. Were they ever tried out? A. They were never machined up and tried out.

RX. 325. Did you ever make any measurements to determine whether or not the rib structure was flexible? A. I never did.

RX. 326. The opinions that you have expressed are absolutely theoretical? A. They are not.

RX. 327. What actual facts have you upon which you base the opinions that you have expressed? A. From an engineer's viewpoint, any structure, it would be only reasonable to believe that such would be the case; further, the fact that the split skirt as tried out in [97] Exhibit 8 and later as constructed in 1914 and like Exhibit 11 confirmed our beliefs.

RX. 328. Exhibit 8 relies upon flexibility of the skirt wall entirely to perform its function, does it not? A. It does.

RX. 329. Can a piston of Exhibit 8 in your opinion be fitted as closely as a piston as shown in your application drawing? A. As I have never tried out a structure as shown in Exhibit 1, I could not say. However, from the experience of Exhibit 8 in the Excelsior motor, the same as Exhibit 11 in the Buda motor, I would say it would be very close.

RX. 330. In other words, you would get the full result or approximately the full result from the use of the piston shown in Exhibit 8 as you would in a piston shown in Exhibit 1, is that correct? A. You would get a good result, but not as perfect a result.

RX. 331. Where would the result differ? A. There would be a more uniform expansion of the skirt as designed in Exhibit 1 than as experimented with in Exhibit 8.

RX. 332. You are expressing that opinion from an engineering and theoretical standpoint, and not from anything that you know from actual tests of the fact, is that correct? A. From actual tests of Exhibit 8 and Exhibit 9 and Exhibit 11, not having finished up one like Exhibit 19; but from the performance of these other latter two, I would say the construction as of 19 would be superior in its functions to 8 and 11 and that it would work perfectly.

RX. 333. Do you know of a piston of the construction of Exhibit 19 ever having been put in actual use? A. I do not.

RX. 334. Exhibit 19 has the ribs running parallel to each other and in a straight line, has it not?

By Mr. Richey: I object. The piston is in evidence and is the best evidence of how the ribs run. The patent office can see this from the exhibit.

A. They have.

RX. 335. The pistons that you say were made and not completed following the general structure of [98] Exhibit 19, did they have the ribs curved or straight? A. They were straight.

RX. 336. With a structure such as 19 is the circumferential expansion and contraction of the skirt uniform throughout the length of the circumference? A. I would not say that it is absolutely uniform, as it would be almost impossible or practically impossible to unite any form of rib and tie to the piston pin bosses and have a perfect cylindrical contraction or expansion.

RX. 337. Where would the greatest point of wear occur or points of wear? A. The greatest points of wear on a piston occur on the thrust sides which are at right angles with the pins.

RX. 338. Isn't it also true that they would occur on a line in the plane of the ribs? A. That would be at right angles with the pin on the thrust side, which is the natural point of wear; and the object of the rib is to carry the load and transmit it to the skirt in that position.

RX. 339. Considering the thrust side, would there be any difference in the lines of wear in the arc represented by the thrust side in piston 19? A. The thrust side always carries the most wear owing to the excessive load over the free running or compression side.

RX. 340. I think that you probably misunderstood the last question. Will you consider the question again and make an effort to answer it?

The notary reads RX. 339.

A. I can only state that there would be very little wear on the sides in a plane with the pin; there would naturally be more wear on the thrust side, which would be at right angles with the pin, and which would be the pressure position of the skirt in relation to the ribs. As far as there being any distinguishing lines after the structure had seated itself to the cylinder walls, there would be practically no difference.

RX. 341. How close was the piston of Exhibit 8 construction fitted in the cylinder of the engine? A. They were fitted just as close as they could be machined and made to slide through freely dry. This does not include the head portion carrying the rings, as ample [99] clearance was given to the head portion, as in all cases of all pistons, to prevent any chance of seizing where there is no means for expansion.

RX. 342. The supplemental oath that was inquired about on cross examination and re-direct was executed at Cleveland, was it? A. It was.

RX. 343. What were the circumstances under which it was executed, if you now recall? A. I don't recall just what the circumstances were. I was in Cleveland and I was at the offices of—I don't know whether it was Gehr or who it was, but I was up to somebody's office up there anyway, and we were simply talking over the situation, or talking over this piston structure, and the amendment papers were given to me and read over, and I read them over and signed them. I had no recollection of it; I had forgotten all about it.

RX. 344. Was the supplemental oath prepared by Mr. Tibbetts or by someone else? A. I can't say who it was prepared by.

RX. 345. By whom was it submitted to you? A. I don't know who gave it to me and handed it to me.

RX. 346. In whose office was it submitted to you? A. Well, that I can not say because, to the best of my recollection, the name of the institution was—well, there was a Watts connected with it; I guess that is about all I remember, somebody and Watts, as I recall it. I don't know what the name of the business was, whose the attorney's office was, but Watts, I guess, and Mr. Slough.

RX. 347. Were these gentlemen partners of Mr. Richey who is representing your application here? A. I can't say that; I don't know.

RX. 348. What building was it in, do you know? A. No, I do not.

RX. 349. At whose request did you go to Cleveland? A. That I don't know.

RX. 350. Was the Pomeroy Hartog interference mentioned to you?

By Mr. Richey: Objected to as immaterial and counsel makes the witness his own.

A. Pomeroy Hartog? It was not. [100]

RX. 351. Are you positive of that? A. I am. I don't know that I ever heard the name before until I heard it today, heard it in this case if I heard it at all.

RX. 352. Did you know at that time any interest in the invention had been assigned to other parties than the Packard Company? A. I did not.

RX. 353. Did you learn later that it had been? A. I learned that some sort of a deal had been made by the Packard Company, but didn't know what it was; don't know today who owns it.

RX. 354. Did the parties at whose request you executed the supplemental oath purport to represent the Packard Company at that time? A. Well, I can't say as to that either.

RX. 355. Did you have anything to do with the making of Exhibit No. 19? A. I did not.

Mr. Kingsland: That is all.

Re-Cross Examination by Mr. Fletcher.

RX. 356. Am I to understand that the red lines which you have sketched on Exhibit No. 17 with respect to the slotting of the piston is identical with the slots or slotting of Exhibit 8? A. The same general character.

RX. 357. Then from what you say, the type or kind of slotting made in Exhibit 17 as indicated by the red lines was the first slotting made by you on pistons, is that correct? A. That is correct.

RX. 358. What position did Mr. Randall hold with the Amplex Motor Company? A. Well, he was sort of a—he was manager for the receiver, and when he went with us he was a director and stockholder and served as factory manager.

RX. 359. Was he director and stockholder of the company at the time he receipted the bill of sale marked Exhibit 23? A. He was.

RX. 360. Where is Mr. Randall now? A. I don't know, but believe he is in Toledo.

RX. 361. At the time you signed the supplemental oath referred to in the cross examination of Mr. Kingsland were you advised by anyone of a certain [101] patent having issued before November, 1922, as relating to a slotted piston? A. I was not.

Mr. Fletcher: That is all.

Re-Direct Examination by Mr. Richey.

RQ. 362. When, with respect to the sale of the car covered by the bill of sale of July the 16th, 1914, Exhibit 23, were the split pistons put in the car? A. Right immediately after the car was purchased.

RQ. 363. They were not in the car at the time you purchased it, were they? A. No, they were not.

RQ. 364. The split skirt pistons that were put in the car were yours before they were put in the car, weren't they? A. They were my personal property;

I paid for them, as I had made no assignments of any patents or designs or appliances to the Amplex Manufacturing Company, or at any time up to the receivership in 1914.

RQ. 365. That is, you mean you paid for the castings? A. I paid for the castings; and also I paid for the castings through the Amplex Company.

Mr. Richey: That is all.

Re-Cross Examination by Mr. Kingsland.

RX. 366. At the time you got the bill of sale, Exhibit No. 23, was the pistons of Exhibit No. 11 installed in the car? A. They were installed in the car the day it was sold to me.

RX. 367. Well, when was the payment for the car made in relation to the date that you got it? A. Payment for the car was made, the money was turned over to the company some, oh, I should say a week or ten days prior to the bill of sale, as I had advanced the company some money and this was a consideration for the money that I had advanced to the company.

RX. 368. In other words, you had a credit with the company? A. Yes.

RX. 369. And the credit was absorbed by taking over the car? A. That was it.

RX. 370. Did you make any separate payment for the pistons that were installed in the car, or was it [102] all covered by one purchase price? A. No, it was not covered by one purchase price. I purchased the car as it was at that time with the Buda pistons in it and the pistons as were put in it, the split pistons as were put in it like 11, were my personal property, and, as I recollect, they were billed to the Amplex Manufacturing Company and I paid for them; but they had nothing to do with the sale of the car.

RX. 371. Did you pay a separate consideration for the pistons to the Amplex Company? A. I did. I paid for the material and paid for the work that was done on them.

RX. 372. Have you any paper showing the transaction of the purchase of the pistons as a separate item? A. I have not.

RX. 373. But you are sure that there was a separate memorandum of purchase for the pistons, is that correct? A. Positively sure.

Deposition Closed.

Edward J. Gulick. [103]

PLAINTIFFS' EXHIBIT NO. 66.

Patent Office List of Applications of Long.

(Filed January 27, 1934.)

(Attorney's Room, Jun 29 1925 U. S. Patent Office.)

(Docket Division Jul 2 1925 U. S. Patent Office)

To the Hon. Commissioner of Patents:

Please permit the H. H. Franklin Manufacturing Company of Syracuse, New York, or its authorized agent or attorney to inspect the files and make copies of the papers therein of each of my pending applications as follows:

Serial Number	*Title*	*Filed*
231,786	Case "A"	May, 1919
281,175	Case "D"	March, 1919
304,283	Case "E"	June 14, 1919
317,273	Case "F"	August 13, 1919
339,892	Case "G"	November 22, 1919
375,673	Case "H"	April 22, 1920
437,690	Case "I"	January 17, 1921
432,719	Case "J"	December 23, 1920
522,974	Case "L"	December 17, 1921
602,660	Case "M"	November 22, 1922
624,463	Case "N"	March 12, 1923

Signed at Detroit, State of Michigan, this 13th day of April, 1925.

(Seal)

PLAINTIFFS' EXHIBIT NO. 67-B.

Opinion of Examiner in Interference No. 49,569.

(Filed January 27, 1934.)

Final Hearing March 23, 1928.

In the United States Patent Office.

Patent Interference No. 49569.

Hartog v. Long v. Gulick.

Pistons.

Application of Stephen D. Hartog filed February 16, 1920, No. 359,137.
Applications of Elmer C. Long filed August 13, 1919, No. 317,273; filed March 7, 1919, No. 281,175.
Application of Edward J. Gulick filed November 30, 1917, No. 204,661.

Messrs. Rippey & Kingsland for Hartog.
Messrs. Swan, Frye & Murray for Long.
Mr. Ray S. Gehr for Gulick.

The interference includes two counts, count 2 having originally constituted the sole count of Interference No. 49,572, consolidated herewith October 8, 1925. The two counts read as follows:

Count 1: A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

Count 2: A piston having a head with top and side walls in combination with a guide structure

connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

The inventions defined by these counts constitute two of the numerous efforts to construct pistons for internal combustion engines of aluminum or aluminum alloys. Because this material has a large coefficient of expansion it was found that a plain piston would be either too small when cold or too large when hot. Special structures have been designed to counteract the tendency of the pistons to expand and these two counts define two of such structures.

Hartog does not dispute priority with Gulick but contends that Gulick did not disclose the invention of these counts in his application as filed. With respect to count 1 it was ruled by the law examiner on April 4, 1924, that the Gulick application disclosed the invention. With respect to count 2 the law examiner made a similar ruling on the same date, his opinion on this count being Paper No. 40 in Interference File 49,572. There is no evidence which was not before the law examiner from which it could be inferred that Gulick has no right to make the counts. The matter, therefore, is not open for reinvestigation by the examiner of interferences (Rule 130). This question has been discussed somewhat more fully in an opinion of even date herewith made in Interference No. 49,570. That discussion is relevant particularly to count 2 of the present interference.

Long bases his case for priority over the November 30, 1917, filing date of Gulick on what he designates as his type "F" piston for count 1, and his type "D" piston for count 2.

Concerning the type "F" piston it is stated in brief for Long on page 18 that he testifies to conception in March or April, 1917, and explanation to others about the same time, that he personally made up several of the pistons in his shop in Hannibal, Missouri and installed a set of the pistons early in 1917 in the car of one Sprick and in Franklin motors. Long's testimony is found in his record (pp. 211 to 224) and it does not include a particle of contemporary evidence supporting the 1917 date.

It is entirely clear that an inventor like Long working all the while on such pistons from 1913 until he testified in 1926 would not have any reliable, independent recollection that he made a particular piston in 1917 when there were no definite associations by which to fix this year. Entirely aside from the rule in interferences that there must be corroborated proof for conception and reduction to practice, it would have to be held that Long has failed to give any satisfactory testimony from which it can be concluded that he conceived count 1 prior to Gulick's filing date.

With respect to corroboration as to Long's conception of count 1 prior to November, 1917, it may be said that there is substantially nothing. The Long brief relies upon the testimony of the witnesses Cotter, Royalty, and Marks.

Royalty's testimony relates to the year 1918 and Marks's to the last part of 1917 or the forepart of 1918. This leaves for consideration the testimony of Cotter only.

Cotter testifies (Record, p. 94) that about 1917 Long had a piston similar to Exhibit 1 as nearly as he could remember but that Long made several changes and Cotter could not explain all of these changes. Cotter then attempts to describe the piston to the best of his recollection. In answer to Question 44 Cotter says that Long made so many different changes that he does not know that he could describe any more of the pistons that Long made.

It is entirely clear that Cotter, testifying about nine years after the event, was entirely truthful in admitting that he did not recall a definite piston. That Long had pistons during this interval is unquestionably true. But he has failed to prove that he had, at this early date, a piston satisfying count 1 of the interference.

With respect to count 2, which Long bases on his so-called "D" type, Long claims conception in 1916 and he identifies the piston, Exhibit 1, as having been made by him in that year. His answer to Question 53, (p. 22) is as follows:

> That particular piston I would say was made in the forepart of 1916, I made in the early part of 1916 several sets of this type.

Here, again, as in connection with count 1, Long is testifying as a matter of sheer memory and the unaided memory of a witness testifying ten years after the event

as to one of a large number of similar pistons is not sufficiently reliable. Long's answer already quoted, as well as his answer to Question 49 that "I would say" this piston was made sometime in 1916, indicates that Long is not deliberately falsifying but simply giving his vague impression as to what he had done ten years earlier.

There is no satisfactory corroboration of Long's claim for conception prior to Gulick's filing date. The witness Cotter when shown Exhibit 1 stated that it looked like a Long piston and that he made either it or one like it about 1916 (Q's. 42, 50, 51, Record, pp. 73-74). On cross-examination Cotter declines to swear that he personally made Exhibit 1 and that the date 1916 was given from unaided memory.

The witness Sanders had been a Chicago dealer in Franklin automobiles and he testifies that he met Long in the year 1914 at a time when Long had a machine shop in Quincy (Record, pp. 106-107). As it appears from Long's own testimony (pp. 40-41) that he had no interest in Quincy until 1917 it is manifest that the witness Sanders is mistaken in his date to the extent of three years. This illustrates very well the unreliability of memory for such long periods. The effort of Sanders to describe the piston that he saw was also partially unsuccessful (pp. 112-113).

The witness Stellman had been engineer for the H. H. Franklin Mfg. Co. and he testifies that a piston of similar design to Exhibit 1 was shown to him by Long in March, 1916 (Record, pp. 125-129). He also states in answer to Question 55 that Long brought or sent pistons to the Franklin Company from then on in varying quantities for test. The records of the Franklin Company, however, do not show any test prior to October, 1918. (See Gulick's Record, pp. 176-178, and Long's Record, pp. 300-312.) The witness Stellman testifies that he first saw the Long piston at the Chicago automobile show in 1916, but Stellman attended shows in other years (Record, p. 137) and he has no satisfactory way of fixing the 1916 show as the one at which he saw Long's piston. On cross examination in answer to XQ. 114 he stated that the piston which he saw in 1916 was not identical in construction with Exhibit 1.

The witness Royalty is an automobile mechanic who saw pistons in Long's place of business in 1916 and states that Exhibit 1 is like the sample which he saw at this time. (Q's. 40, 52, and 53, Record, pp. 144-146.) On cross examination he is somewhat more definite in stat-

ing in answer to XQ. 152 that the construction of Exhibit 1 is the same that he had seen in Long's place in Hannibal, Missouri, but that he would not say that he ever saw Exhibit 1 itself. As he stated in answer to Q. 39 (p. 176), it is pretty hard for anyone to remember exact details of construction, after several years. This testimony fails sufficiently to fix any specific year when he saw the piston like Exhibit 1.

The only other witness relied upon by Long as corroborating his prior conception of count 2 is the witness Wood and his testimony is much more indefinite than that of the other witnesses already discussed.

Long's entire case for priority of conception is in substance based upon the unaided memory of several witnesses speaking about ten years after the event and speaking then with the degree of uncertainty that is inevitable under such circumstances. Long had fifteen to twenty applications for split-skirt pistons on file at the time he was testifying, and had built a great many different forms for which no application was made. (Record, p. 42.) It was thought that no one after a period of many years would be able to recall the particular year when he saw a specific structure of any particular kind of piston from a large number of similar pistons unless there was some special facts that had impressed upon the mind of the witness this particular year and structure. The Long case for priority is fatally defective as to date and identity of the invention of count 2.

There are no facts upon which the examiner of interferences would rule that the Gulick application fails to disclose the inventions defined by the two counts. There is no adequate proof that Long had conceived the invention of either of these counts prior to Gulick's filing date. It is, therefore, held that Gulick is the first inventor of the subject matter of both counts.

Priority of invention of the subject matter in issue is hereby awarded to Edward J. Gulick, the senior party.

Limit of appeal: August 2, 1928.

'PLAINTIFFS' EXHIBIT NO. 67-C.

Opinion of Board in Interference No. 49,569,

(Filed January 27, 1934.)

Appeal Nos. 252-253. REH
Hearing: May 3, 1929

IN THE UNITED STATES PATENT OFFICE

BEFORE THE BOARD OF APPEALS

HARTOG v. LONG v. GULICK

Patent Interference No. 49,569 between the application of Stephen D. Hartog, filed Feb. 16, 1920, Serial No. 359,137; and applications of Elmer C. Long, filed Aug. 13, 1919, Serial No. 317,273; and Edward J. Gulick, filed Nov. 30, 1917, Serial No. 204,661. Pistons.

Messrs. Rippey & Kingsland for Hartog.
Messrs. Swan, Frye & Murray for Long.
Messrs. Evans & McCoy for Gulick.

This is an appeal from the decision of the Examiner of Interferences by the party Hartog and the party Long on the award of priority to the party Gulick.

The invention involved is defined by two counts as follows:

1. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

2. A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

The invention relates to a piston of the split skirt type in which there is yielding means between the head and sections of skirt of the piston and piston pin supports are carried by the yielding means.

The filing date of the party Gulick is November 30, 1917, and the party Hartog does not urge priority over this date but the party Long offers testimony which he urges proves conception prior to Gulick's filing date. Long submits no additional brief analyzing the decision of the Examiner of Interferences, and, while Long's counsel was present at the hearing, no specific oral argument was presented along this line. We have carefully considered the decision of the Examiner of Interferences on this point and concur in his decision in holding that the evidence offered did not show conclusively that Long had established a date of conception prior to Gulick's filing date.

It is urged by both Long and Hartog that Gulick is not entitled to make the count. It is contended that there was nothing in the original disclosure of the Gulick application which in any way referred to the means for supporting the skirt of the piston as being resilient. A careful discussion of Gulick's structure in relation to the application as originally filed has been made in our decision in interference No. 49,570 in which the same parties are involved and in which a decision is being rendered as of even date herewith. In that decision we reach the conclusion that although there is nothing in Gulick's application as originally filed that refers to resiliency, we consider that this feature is necessarily inherent in the structure as the support for the split skirt must be resilient in order to allow the piston to expand without expanding the skirt. We therefore concur in the decision of the law examiner referred to in the decision of the Examiner of Interferences that Gulick can make count

2. We also concur in the decision of the law examiner, as set forth in paper No. 39 of April 4, 1924, referred to in the decision of the Examiner of Interferences, that Gulick is entitled to make count 1.

We are urged to take note of certain patents which, it is contended, constitute anticipation but this matter is not before us for consideration and we do not deem it advisable to take it up of our own initiative, especially as these patents have been referred to in the records of these interferences for several years.

The decision of the Examiner of Interferences awarding priority of the subject-matter of the two counts to Edward J. Gulick is affirmed.

M. J. MOORE,
Assistant Commissioner,
G. R. IDE,

PLAINTIFFS' EXHIBIT NO. 68-A.

Opinion of Examiner in Interference No. 49,575.

(Filed January 27, 1934.)

Hearing: Mar. 4, 1924. kse

IN THE UNITED STATES PATENT OFFICE.

DAY VS. TAYLOR VS. LONG VS. MAYNARD VS. GULICK.

PATENT INTERFERENCE No. 49,575.

MOTION TO DISSOLVE.

PISTONS.

Application of Ray E. Day filed Jan. 10, 1923, Ser. No. 611,698.
Application of George A. Taylor filed June 17, 1922, Ser. No. 569,104.
Application of Elmer C. Long filed Dec. 17, 1921, Ser. No. 522,974.
Application of Howard E. Maynard filed Jan. 5, 1921, Ser. No. 434,467.
Application of Edward J. Gulick filed Nov. 30, 1917, Ser. No. 204,661.

Mr. Clarence E. Mehlhope for Day.
Messrs. Macleod, Calver, Copeland & Dike for Taylor.
Mr. Herbert G. Fletcher for Long.
Mr. J. King Harness for Maynard.
Mr. Ray S. Gehr for Gulick.

The party Long moves to dissolve on the ground that the party Gulick is not entitled to make the count which is as follows:

> A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

It is practically conceded by the motion that Gulick can make all of the count upon his disclosure except the last clause, "said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion." It will not be necessary therefore to point out how the count reads upon Gulick's drawings in other respects. The skirt 11 has a split 21, clearly shown in Fig. 2, extending from top to bottom of the skirt on one side only of the pin bosses in Figs. 3 and 4. If the split permits free expansion and contraction of the skirt portion there is no need for argument to support Gulick's right to make the count.

Long argues that Gulick's piston is of rigid construction and Long's piston has a flexible structure. The Gulick specification describes a piston adapted to expand but not expand against the cylinder wall to such an extent as to stick, and it is split longitudinally so that it will not expand in circumference with a force great enough to cause the piston to stick. An expansion and contraction of the skirt portion is therefore permitted by the longitudinal slit. The rigidity of the webs 17, 18 with relation to the piston head is effected by the transverse stiffening ribs above the bosses 16 which may be seen in Figs. 1, 2, and 3 but on the side of the bosses 16 and below them there are no stiffening ribs. This is clear from Fig. 4.

The expansion and contraction mentioned in the count are due to thermal action, the head of the piston when in operation being highly heated. The effect of mechanical stresses is not taken into account. If the skirt 11 expands circumferentially when heated, as the specification states, the flanges or ribs 17 and 18 must allow such expansion and it is not material for the present purpose whether they move about one end or are slightly flexed laterally. The stated purpose of the longitudinal split being to prevent too great circumferential expansion, obviously some circumferential expansion takes place. *Free* expansion can not imply the absence of ribs connected to the skirt since Long has such ribs. If there is any difference of structure by reason of which Long's ribs 12, 13 permit expansion of the skirt and Gulick's ribs 17, 18 do not permit expansion of the skirt, the difference is not recited in the count.

Gulick discloses all the structural elements set forth in the count, and refers to the circumferential expansion

of the skirt, the split 21 preventing too great an expansion. This seems to be all that is necessary, and it is not important how Gulick may have described his device if as a matter of fact it has the requisite structure and function.

The motion is denied.

I. P. DENNEY,
Law Examiner.

PLAINTIFFS' EXHIBIT NO. 68-B.

Opinion of Board in Interference No. 49,575.

(Filed January 27, 1934.)

NLH

Hearing: June 20, 1924

Appeal No. 10,422. U. S. Patent Office. August 7, 1924.

Before the Examiners-in-Chief, on Appeal.

In the matter of the interference between the application of Elmer C. Long, filed December 17, 1921, Serial No. 522,974 and the application of Edward J. Gulick, filed November 30, 1917, Serial No. 204,661. Interference No. 49,575.

Pistons.

Mr. Herbert G. Fletcher for Long.
Mr. Ray S. Gehr for Gulick.

This is an appeal by Long from the decision of the examiner of interferences awarding priority of invention to the senior party Edward J. Gulick upon the record.

The issue is as follows:

> A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

The party Long moved to dissolve the interference on the ground that the party Gulick is not entitled to make the claim in issue. This motion having been denied by the law examiner the question of the right of Gulick to make the claim is now raised as the sole ground of this appeal, under the provisions of Rule 130.

It is admitted that the drawings of Gulick disclose all the structure specified in the count, the only contention being that his structure is such that it will not "permit free expansion and contraction of the skirt portion." The skirt is split at 21 and the specification states, page 3, line 21:

"In order that the skirt may not expand an undue amount when the piston is heated, as under operating conditions, it is split longitudinally as at 21."

The object of the split is to permit this expansion, the increased circumference being allowed for by the slot, instead of forcing the wall out radially against the cylinder as would be the case if the slot were absent. If the webs 17, 18 were so rigid that they would not yield laterally, the slot would have no function. Under the action of the heat, the circumferential expansion of the skirt would necessarily flex the webs 17 and 18 sufficiently to permit the expansion without substantial increase of the diameter of the skirt.

We have no doubt that Gulick can make the claim of the issue and the decision of the examiner of interferences is affirmed, priority of invention being awarded to Edward J. Gulick, the senior party.

Limit of Appeal:
August 27, 1924.

PLAINTIFFS' EXHIBIT NO. 68-C.

Opinion of Court of Appeals of District of Columbia in Interference No. 49,575.

(Filed January 27, 1934.)

IN THE COURT OF APPEALS
OF THE DISTRICT OF COLUMBIA.

ELMER C. LONG,
Appellant,
vs.
EDWARD J. GULICK.
No. 1868.

Before Martin, Chief Justice; Robb and Van Orsdel; Associate Justices.

VAN ORSDEL, *Associate Justice.* This appeal is from the decision of the Commissioner of Patents in an interference proceeding in which priority of invention was awarded to the senior party Gulick.

The single count in issue reads as follows: "A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion."

The party Long moved to dissolve the interference on the ground that Gulick is not entitled to make the claim. The motion was denied by the Law Examiner, and his ruling was sustained on appeal by the Board of Examiners in Chief and by the Commissioner of Patents.

No testimony was taken in the case, and Long being the junior party, the only question to be reviewed is Gulick's right to make the claim.

The drawings of Gulick, we think, clearly disclose the structure of the count. It is contended, however, that his structure is not such as will "permit free expansion and contraction of the skirt portion." But the claim expressly covers this objection in the following language: "Said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion." We think it clear that the

object of the split is to permit of this expansion and, as held by the Board of Examiners, "under the action of the heat, the circumferential expansion of the skirt would necessarily flex the webs sufficiently to permit the expansion without substantial increase of the diameter of the skirt."

In this view of the case the right of Gulick to make the claim is beyond question. This point being settled, priority on the record goes to the party Gulick as a matter of course.

The decision of the Commissioner is affirmed.

JOSIAH A. VAN ORSDEL,
Associate Justice.

No. 1868 Patent Appeal. Elmer C. Long, Appellant, vs. Edward J. Gulick. Opinion of the Court per Mr. Justice Van Orsdel. Court of Appeals. District of Columbia. Filed February 7, 1927. Henry W. Hodges, Clerk.

Hearing: Mar. 3, 1924. kse

IN THE UNITED STATES PATENT OFFICE.

DAY vs. TAYLOR vs. LONG vs. MAYNARD vs. JARDINE vs. HARTOG vs. GULICK.

PATENT INTERFERENCE No. 49,570.

MOTION TO DISSOLVE.

PISTONS.

Application of Ray E. Day filed Jan. 10, 1923, Ser. No. 611,698.
Application of George A. Taylor filed June 17, 1922, Ser. No. 569,104.
Application of Elmer C. Long filed Dec. 17, 1921, Ser. No. 522,974.
Application of Howard E. Maynard filed Jan. 3, 1921, Ser. No. 434,467.
Application of Frank Jardine filed March 9, 1921, Ser. No. 450,898, renewal of application filed March 11, 1920, Ser. No. 364,997.
Application of Stephen D. Hartog filed Feb. 16, 1920, Ser. No. 359,137.
Application of Edward J. Gulick filed Nov. 30, 1917, Ser. No. 204,661.

Mr. Clarence E. Mehlhope for Day.
Messrs. Macleod, Calver, Copeland & Dike for Taylor.
Mr. Herbert G. Fletcher for Long.
Messrs. Whittemore, Hulbert & Whittemore and Mr. J. King Harness for Maynard.
Messrs. Richey, Slough & Watts for Jardine.
Messrs. Rippey & Kingsland for Hartog.
Mr. Ray S. Gehr for Gulick.

The party Hartog moves to dissolve on the ground that the party Gulick has no right to make the claim because Gulick does not disclose the essential element

"internal yielding ribs supporting the head and body." The count is as follows:

> A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

At the hearing the party Gulick offered certain affidavits in support of Gulick's right to make the count and to traverse references cited in other motions in related interferences. The party Hartog objected to the affidavits on the ground that they were inadmissible because they were expert opinion affidavits and were not filed at least five days prior to the hearing. The objection was sustained in view of the decision in *Horton v. Leonard*, C. D., 1910-81, without prejudice to the filing of proper affidavits in other related interferences restricted to consideration of the references. Since the interference is one of a series in which numerous motions are to be heard, involving the same references, the party Hartog will have ample time to consider the unobjectionable part of the affidavits before the termination of the discussion so that objection to the admissible part of the affidavits because of insufficient notice becomes technical.

The head of the Gulick piston is part 10, the body is skirt 11, the internal ribs supporting the head and body are ribs 17, 18 with extensions 20, and the means on the ribs adapted to form engaging connection with operable parts for said piston is the bosses 16 which receive the wrist pins of the connecting rod.

It will be apparent that the question for decision is whether or not the ribs 17, 18, 20 are yielding. The extent and character of the yielding, or any definite construction or configuration of the rib by which it is made to yield are not expressly stated in the count. There are several forces at work upon the ribs when the piston is in operation resulting from a thermal expansion due to heat transmitted from the intensely heated surface of the piston head, and mechanical stresses during compression or explosion of the gas. The material used in most cases is a light aluminum alloy having a much larger coefficient of expansion than cast iron and ordinarily requiring a greater initial clearance between piston and cylinder than cast iron. The head expands radially to a greater extent than the skirt, and the ribs would presumably expand more than the skirt because heat is transmitted

directly to the ribs and the skirt is separated from the head by the annular opening 12. If Gulick's ribs are yielding on account of thermal action thereon, it will be unnecessary to consider if they are yielding in response to mechanical stresses. The skirt 11 expands circumferentially under the influence of heat, and the slit 21 is provided to prevent too great expansion. The upper parts of the ribs are stiffened by transverse flanges between the piston head and the pin bosses but the lower parts are free from stiffening flanges and directly connect the pin bosses to the skirt by relatively narrow rib portions as shown in Fig. 1. If the skirt and the ribs expanded uniformly so that elongation of a rib would be accompanied by a corresponding circumferential elongation of the skirt, the rib and the skirt moving together to the same extent, there might not be any substantial lateral flexure or yielding of the rib but it is not seen how they can expand uniformly or how some lateral flexure or yielding of the rib 18 between the boss and the skirt can be avoided. The yielding need not be great or due to any special structure of the rib to support the count. Nor is it necessary that the entire rib should yield. If it yields at all for any purpose or for any reason, it would come within the scope of the count. It can not be conceded that the purpose of slot 21 in Gulick's skirt is defeated by alleged rigidity of the lower parts of the ribs, and Gulick is obviously not alone in stiffening the parts of the ribs above the pin bosses. Hartog's rib structure is no where mentioned in the count and can not be read into the count by any accepted rule of interpretation. *Scott vs. Longtin*, C.D., 1922-145. The intended scope of the count is obvious from the different specific disclosures in the respective applications of the several parties.

The motion is denied.

I. P. Disney,

Apr 4 1924 *Law Examiner.*

PLAINTIFFS' EXHIBIT NO. 69-A(2).

Opinion of Examiner of Interferences in Interference No. 49,570.

(Filed January 27, 1934.)

Final Hearing: March 23, 1928. ES/HMH

IN THE UNITED STATES PATENT OFFICE.

PATENT INTERFERENCE No. 49,570.

LONG v. HARTOG v. GULICK.

PISTONS.

Application of Elmer C. Long filed December 17, 1921, No. 522,974.
Application of Stephen D. Hartog filed February 16, 1920, No. 359,137.
Application of Edward J. Gulick filed November 30, 1917, No. 204,661.

Messrs. Swan, Frye & Murray for Long.
Messrs. Rippey & Kingsland for Hartog.
Mr. Ray S. Gehr for Gulick.

The invention involved is defined in a single count as follows:

> 1. A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

The party Hartog claims no date earlier than Gulick's filing date. As between Hartog and Gulick, the sole question is whether the Gulick application as filed disclosed the invention defined by the count. And with respect to the count, the controversy centers entirely around the word "yielding." Hartog's motion to dissolve was denied by the law examiner in an opinion of April 4, 1924. The law examiner ruled that the ribs 17, 18 and 20, shown in Hartog's application as filed, would at least be yieldable in response to thermal action and that this would satisfy the requirement of the count. He further ruled that when the skirt 11 expands uniformly

with the ribs there will be an elongation of the ribs corresponding to the circumferential elongation of the skirt. He therefore denied Hartog's motion to dissolve, and held that Gulick disclosed the invention in his application as filed.

It is recognized that Gulick did not mention in his original application any yieldability of the ribs or in any way indicate recognition of this feature until years after the filing of his application. Hartog also urges that subsequent to the decision of the law examiner there was a ruling by the Examiners-in-Chief and by the Commissioner in another interference, *Jardine v. Hartog*, No. 49,578, that should control the interpretation of the count in the present interference. It is thought, however, that this ruling with respect to different disclosures, while significant and guiding, is not so clearly decisive as to justify the interference examiner in deciding that the ruling of the law examiner was erroneous (Rule 130).

Hartog has taken testimony directed to proving that his invention date is earlier than Long's, but he has not taken any to prove that the Gulick original disclosure did not include the invention of this count. On the other hand, Gulick has presented the testimony of the witnesses Gruenfeldt and Linney, directed to showing that a piston closely similar to the Gulick application disclosure is operative. From this operativeness Gulick argues that there must be a slight lateral flexing or yielding of the ribs. Whether this conclusion necessarily follows need not be decided. At least Hartog has presented no testimony on the subject.

It is noted also that the Court of Appeals of the District of Columbia has ruled in the case of *Long v. Gulick*, 360 O. G. 262; 1927 C. D. 134; 17 Fed. (2d) 686, that the webs of the Gulick application involved in the present interference are necessarily flexed under the action of heat.

Upon the whole case there does not appear to be any sufficient reason for the interference examiner to arrive at a conclusion contrary to the decision made by the law examiner with respect to Gulick's right to make the count.

There remains for consideration the question of priority as between Long and Gulick. Gulick's application was filed November 30, 1917, and Gulick presents testimony directed to showing that he made the invention earlier than this date. It is not found, however, that

Long has established that he had conceived the invention at any time prior to Gulick's filing date. The Long brief places reliance upon a piston which Long designates as the "G" type. This "G" type piston is illustrated by the Long Exhibit X-1 and Long testifies in answer to question 52, page 188, that this piston was made in the early part of 1917. He admits on cross-examination (XQs. 120-123; p. 198) that he gives this date of 1917 upon the basis of unaided memory. The testimony of a person speaking in 1926 as to what he had done in 1917 would be of little weight unless there was some way for establishing the time. This is particularly true in the present case because, as Long tells in answer to cross-question 149, he was constantly experimenting on all types of pistons that he could think about, and under these circumstances it is not reasonable to believe that he could definitely determine that one particular piston was made in one particular year when he had nothing to aid him in fixing this year.

Even if Long's testimony itself were much stronger than it is, it would not be sufficient without corroboration, and Long has no corroboration with respect to Exhibit X-1 for any date earlier than 1918. The witness Royalty thinks that he saw Exhibit X-1 at Quincy, Illinois, in 1918, but he is not positive (Qs. 53-58; pp. 177-178); the witness Wood testifies to a date in 1918 or 1919; he says that the piston he saw had some kind of a metal rod in it but he did not pay much attention to that (Q. 121; p. 245).

It is found that Long has not established that he had conceived the invention prior to Gulick's filing date and that the Gulick application as filed disclosed the invention in issue. Hartog claims no date earlier than Gulick's filing date.

Priority of invention of the subject matter in issue is awarded to Edward J. Gulick, the senior party.

Limit of appeal: August 2, 1928.

H. I. Houston,
Examiner of Interferences.

July 2, 1928.

PLAINTIFFS' EXHIBIT NO. 69-B(1).

Petition for Rehearing in Interference No. 49,570.

(Filed January 27, 1934.)

IN THE UNITED STATES PATENT OFFICE

BEFORE THE BOARD OF APPEALS.

ELMER C. LONG, v. STEPHEN D. HARTOG, v. EDWARD J. GULICK,	INTERFERENCE No. 49,570.

PETITION FOR REHEARING.

Comes now the party Hartog in the above entitled interference and moves for a rehearing of the decision of the Board of Appeals, dated June 3, 1929, and, for ground of the petition, shows to the Honorable Board the following:

1. That the Board misconstrued the disclosure of the Gulick application and, therefore, erred in its finding that—

> "If the piston expands and the skirt does not we consider that the support for the skirt must necessarily be resilient and that this is an inherent quality of all pistons of this general nature."

2. That the Board erred, even on the assumption that the internal ribs of the Gulick structure were yielding, in permitting Gulick to predicate invention upon the characteristic of the ribs which the Board has found was not disclosed in the application as originally filed by Gulick.

3. That the Board has misconstrued the invention covered by the count of this interference, and has placed a construction on the count out of harmony with the Hartog application (in which the count originated) in which the ribs were shown of a structure (springlike in character) that was yielding, and were thus differentiated from the art.

4. That because of the construction given to the count this Board has held the count to be nothing more than was in the prior art and particularly in United States patent to Ebbs, No. 700,309, dated May 20, 1902, and United States patent to Van Bever, No. 1,031,212, dated July 2, 1912, in which the skirt was split and supported by an internal structure and in which, like the Gulick structure, the piston contracts by the flexibility of the skirt, and not by the inherent or actual resiliency or yieldability of the *internal* support.

WHEREFORE the party Hartog prays for a rehearing to the end that the errors in the decision of this Honorable Board may be corrected in order that justice may be done in the premises.

Respectfully submitted,

.....,

Attorneys for Hartog.

Opinion of the Board in Interference No. 49,570.

(Filed January 27, 1934.)

Appeal Nos. 254-255. REH

IN THE UNITED STATES PATENT OFFICE

Before the Board of Appeals

Long v. Hartog v. Gulick

Patent Interference No. 49,570 between the application of Elmer C. Long, filed Dec. 17, 1921, Serial No. 522,974, and applications of Stephen D. Hartog, filed Feb. 16, 1920, Serial No. 359,137, and Edward J. Gulick, filed Nov. 30, 1917, Serial No. 204,661. Pistons.

Messrs. Swan, Frye & Murray for Long.
Messrs. Rippey & Kingsland for Hartog.
Messrs. Evans & McCoy for Gulick.

Petition for Rehearing.

The party Hartog has petitioned for rehearing from the decision of the Board of Appeals of June 3, 1929, affirming the decision of the Examiner of Interferences in awarding subject-matter of the count to the party Gulick.

Several allegations of error are set forth but they may be summed up by the statement that the party Hartog urges that we were in error in holding that the party Gulick had a right to make the count because the support for the piston skirt must necessarily be resilient. We have given careful consideration to the memorandum offered in support of the petition but it is unnecessary to discuss this in detail. All the matters referred to therein were before us at the time our decision was rendered and were carefully considered. The point upon which the reconsideration is asked is probably the most important one in the entire series of interferences in which the petitioner is involved. The point has been repeatedly considered in one form or another by tribunals of this office and also in one instance by the Court. We

reviewed the entire record and carefully considered the arguments presented. As a result of this investigation our judgment was deliberately made and we find no reasons presented in this petition which influence us to reach any other conclusion.

The petition for rehearing is therefore denied.

PLAINTIFFS' EXHIBIT NO. 69-B(3).

Opinion of the Board of Appeals in Interference No. 49,570.

(Filed January 27, 1934.)

Appeal Nos. 254-255. REH

Hearing: May 3, 1929

IN THE UNITED STATES PATENT OFFICE

BEFORE THE BOARD OF APPEALS.

LONG v. HARTOG v. GULICK.

Patent Interference No. 49,570 between the application of Elmer C. Long, filed Dec. 17, 1921, Serial No. 522, 974; and applications of Stephen D. Hartog, filed Feb. 16, 1920, Serial No. 359,137; and Edward J. Gulick, filed Nov. 30, 1917, Serial No. 204,661. Pistons.

Messrs. Swan, Frye & Murray for Long;
Messrs. Rippey & Kingsland for Hartog;
Messrs. Evans & McCoy for Gulick.

This is an appeal from the decision of the Examiner of Interferences by the party Long and the party Hartog on the award of priority to the party Gulick.

The invention involved is defined by a single count as follows:

> 1. A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

The invention relates to a piston of the split skirt type in which there is yielding means between the head and skirt of the piston and piston pin supports are carried by the yielding means.

The filing date of the party Gulick is November 30, 1917 and the party Hartog does not urge priority over this date, but the party Long offers testimony which he urges proves conception prior to Gulick's filing date. Long submits no additional brief analyzing the decision of the Examiner of Interferences, and, while Long's

counsel was present at the hearing, no specific oral argument was presented along this line. We have carefully considered the decision of the Examiner of Interferences on this point and concur in his decision in holding that the evidence offered did not show conclusively that Long had established a date of conception prior to Gulick's filing date.

It is urged by both Long and Hartog that Gulick is not entitled to make the count. It is contended that there was nothing in the original disclosure of the Gulick application which in any way referred to the means for supporting the skirt of the piston as being resilient. We have examined this application and we fail to find anything therein as originally filed that in any manner refers to the use of such a term. In the brief of Hartog, (page 74), we find the following language:

> "Under all of the testimony and under the findings of the Patent Office in Interference No. 49,578, Jardine v. Hartog, the ribs do not and cannot yield in the Long structure and they do not and cannot yield in the Gulick structure. This being true, Long as well as Gulick had no right to make count 2 of the present interference, and upon this ground, Hartog must be awarded priority of invention over both Long and Gulick.
>
> This feature is the crux of the whole question where yieldability of the internal ribs is made a feature of the counts.
>
> It is the most important point in the whole series of interferences.
>
> Hartog is so firmly convinced that he is right on this proposition, that he urges and insists that this question must be examined and that this tribunal, bound as it is by the decisions of the Patent Office * * *."

We agree with Hartog that this feature is of greatest importance in the group of interferences that are before us, and in this connection we call attention to the fact that the interferences in which we are rendering decisions of even date herewith, and which were argued at the same time with the counsels for all the parties present are:

49,569, 49,570, 49,571, and 49,579.

We shall have occasion to refer to this decision in the other decisions, and the ruling which we make here in

regard to the question of resiliency of the supporting member for the piston skirt is intended to be applicable to all the cases, even including the pistons regarding which testimony has been offered for establishing early conception.

In Gulick's brief (page 78), we find reference to the same question but in which a different set of decisions is relied upon and which terminate in the decision of the Court of Appeals of the District of Columbia. It is contended by the party Hartog that we should follow the decision in the Jardine v. Hartog interference, No. 49,578, which he holds is favorable to his case. Gulick urges that we should follow the decision in the interference No. 49,575 in which Long raised the same question against Gulick. Gulick contends that we must be bound by the decision of the Court.

We consider that neither party is right in taking his respective position. In interference No. 49,578 neither Long nor Gulick were parties. In interference No. 49,575 Hartog was not a party to the appeal. Of course careful consideration should be given to prior decisions of the same tribunal and great weight should be given to decisions of superior tribunals, but where the parties are different, it is the duty of those rendering a decision to consider each particular case on its own merits.

As previously stated, we find nothing in Gulick's file in regard to the question of resiliency. It is perfectly clear, however, that when the piston skirt was split it was for the purpose of allowing it to yield when the heat caused the piston to expand. If the piston expands and the skirt does not we consider that the support for the skirt must necessarily be resilient and that this is an inherent quality of all pistons of this general nature. We therefore concur in the opinion of the law examiner as referred to in the opinion of the Examiner of Interferences that Gulick has a right to make the count.

Reference has also been made in the brief to the interference of Hartog v. Pomeroy, No. 45,351, but for reasons discussed in connection with the other interferences to which our attention has been called, we hold that the ruling in that interference is not binding upon us in this appeal.

Hartog raises the question of estoppel and refers to prior interferences in which he contends the same parties in interest were involved. We fail to find any proof to substantiate this contention.

The decision of the Examiner of Interferences awarding priority of the subject-matter of the count to Edward J. Gulick is affirmed.

PLAINTIFFS' EXHIBIT NO. 69-C.

Opinion of Court of Customs and Patent Appeals in Interference No. 49,570.

(Filed January 27, 1934.)

UNITED STATES COURT OF CUSTOMS AND PATENT APPEALS.

STEPHEN D. HARTOG,
Appellant,

v.

ELMER C. LONG and
EDWARD J. GULICK,
Appellees.

October term, 1930,
Patent Appeal No. 2609,
Patent Calendar No. 105,
Interference No. 49,570.

BLAND, *Judge.*

This appeal is from a decision of the Board of Appeals in the Patent Office awarding priority of invention in a single count to Edward J. Gulick in which the appellant and Elmer C. Long were parties. From the decision of the Board Hartog appealed here and Long did not.

The count in issue, which was taken from the Hartog application, is as follows:

> 1. A piston comprising a head and body, *internal yielding ribs supporting the head and body,* and means on said ribs adapted to form engaging connection with operable parts for said piston. [Italics appellant's]

The issue in this case involves the same invention and the same applications and substantially the same question as was involved in *Hartog v. Long and Gulick,* Patent Appeal No. 2608, Interference No. 49,569, decided concurrently herewith, and we follow the reasoning of that case in the decision of this one.

The invention relates to an automobile piston, the apron of which is made flexible or resilient in order that it may yield from the pressure occasioned by expansion due to heat. The details of the disclosures need not be repeated here.

This interference originally was between several different parties and progressed in the Patent Office concur-

rently with *Hartog v. Long and Gulick,* Interference No. 49,569, *supra.*

There are but two questions presented: First, had Gulick the right to make the count? Second, is Gulick estopped from making the count of this interference by reason of the decision in *Hartog v. Pomeroy,* Interference No. 45,351.

The first question is, as found by the board, "the most important point in the whole series of interferences." In determining whether Gulick had the right to make the count the crux of the whole question is the yieldable feature of the ribs of the two disclosures. In the instant case we think Gulick's disclosure meets the requirement of the claim in the phrase "internal yielding ribs supporting the head and body" for the same reasons that we concluded that his disclosure met the requirements of the phrase "being resiliently yieldable" in the count of the interference No. 49,569, *supra.* We approve the finding of the Board of Appeals which is expressed in the following language:

> As previously stated, we find nothing in Gulick's file in regard to the question of resiliency. It is perfectly clear, however, that when the piston skirt was split it was for the purpose of allowing it to yield when the heat caused the piston to expand. If the piston expands and the skirt does not we consider that the support for the skirt must necessarily be resilient and that this is an inherent quality of all pistons of this general nature. We therefore concur in the opinion of the law examiner as referred to in the opinion of the Examiner of Interferences that Gulick has a right to make the count.

The case of *Long v. Gulick,* 17 F. (2d) 686, 57 Appls. D. C. 98, decided by the Court of Appeals of the District of Columbia and referred to by this court in *Hartog v. Long & Gulick,* Interference No. 49,569, *supra,* passed upon an issue almost identical with the issue presented here by the first question raised.

As to the second question presented we also agree with the finding of the board which is expressed in the following language:

> Reference has also been made in the brief to the interference of *Hartog v. Pomeroy,* No. 45,351, but for reasons discussed in connection with the other

interferences to which our attention has been called, we hold that the ruling in that interference is not binding upon us in this appeal. Hartog raises the question of estoppel and refers to prior interferences in which he contends the same parties in interest were involved. We fail to find any proof to substantiate this contention.

Hartog suggests that Gulick cannot make the claim for the reason that he is barred from doing so by reason of the doctrine of equitable estoppel, arising from the fact that there was a community of interest or ownership of the subject matter of the interference in *Hartog v. Pomeroy, supra,* and the subject matter of the interference in the instant case. We find nothing in the record to justify the conclusion that such a community of interest exists as is suggested by appellant.

The Board of Appeals properly awarded priority of invention in the subject matter of the count involved in this interference to Gulick over Long and Hartog and affirmatively found that:

> We have carefully considered the decision of the Examiner of Interferences on this point and concur in his decision in holding that the evidence offered did not show conclusively that Long had established a date of conception prior to Gulick's filing date.

The decision of the Board of Appeals, awarding priority of invention to Gulick, is affirmed.

AFFIRMED.

PLAINTIFFS' EXHIBIT NO. 70-A.

Opinion of the Examiner in Interference No. 49,571.

(Filed January 27, 1934.)

Final Hearing: March 23, 1928. ES/LAW

IN THE UNITED STATES PATENT OFFICE.

PATENT INTERFERENCE No. 49571.

LONG v. GULICK.

PISTONS.

Patent granted Elmer C. Long November 1, 1921, No. 1,395,441, on an application filed December 9, 1918, No. 265,947. Applications Nos. 317,273, filed August 13, 1919; 339,892, filed November 22, 1919.

Messrs. Swan, Frye & Murray for Long.
Mr. Ray S. Gehr for Gulick.

The interference is defined in four counts as follows:

1. A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion and separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being cooperably connected at their opposite ends to said cylinder engaging portion.

2. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

3. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from

the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

4. A one piece piston provided with a solid end portion and a skirt portion, said skirt portion having a longitudinally extending slot formed through the thickness of its wall, said slot extending from the rear edge of the skirt portion and forming adjacent disconnected portions in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

The subject matter in controversy between Gulick and Long is a piston for combustion engines so constructed as to be suitable for material like aluminum having a high coefficient of expansion. This attribute of aluminum and its alloys causes pistons made therefrom to expand greatly when heated, so that an ordinary trunk piston is either too loose when cold or when hot it seizes the cylinder walls.

In support of his case for priority with respect to count 1, Long relies upon what he calls his "G" type piston. It is ruled in companion interference No. 49,570, decided simultaneously herewith, that Long has failed to establish conception of the "G" type piston prior to Gulick's filing date. The Gulick application involved in the companion interference is likewise involved in the present interference. The testimony relied upon by Long in the present interference for the "G" type piston consists of the deposition of Long himself (pp. 65-92); that of Royalty (pp. 46-64); and that of Wood (pp. 145-169). The deposition of Long is printed in the record of the companion interference on pages 181-208; that of Royalty on pages 162-170; and that of Wood on pages 230-254. The testimony being the same, and the embodiment relied upon being the same, it is ruled, for the reasons set forth more fully in the decision rendered in companion interference 49,570, that Long has not proved conception of his Exhibit "G" piston prior to Gulick's filing date.

Long relies upon what he calls his Type "F" piston for priority as to counts 2 and 3. It is ruled in companion interference No. 49,569, decided simultaneously herewith, that Long has failed to establish conception of the "F" type piston prior to Gulick's filing date. The Gulick application involved in the companion interference is likewise involved in the present interference. The testimony relied upon by Long in the present interference for the "F" type piston consists of the deposition of Long himself (pp. 124-144); that of Cotter (pp. 13-32); that of Royalty (pp. 46-64); and that of Marks (pp. 213-220). The deposition of Long is the same as that in the said companion interference, there printed on pages 209-229. The Royalty deposition is printed in the other record at pages 162-170. The Marks deposition is printed in the other record at pages 300-307. The testimony being the same, and the embodiment relied upon being the same, it is ruled, for the reasons set forth more fully in the decision rendered in companion interference 49,569, that Long has not proved conception of his Exhibit "F" piston prior to Gulick's filing date.

With respect to count 4, Long relies for priority upon what he calls his "B" type piston. As to this count Long is involved on his patent No. 1,395,441, the count being claim 10 thereof. This patent illustrates a piston having a "T" shaped slot in the skirt, best shown on Figure 2 of the patent drawing. The count, however, does not expressly require the horizontal element of the "T" shaped slot and it is assumed for the purpose of this decision that Long may establish priority by a piston having merely a longitudinally extending slot from the rear edge of the skirt portion, thus forming adjacent disconnected portions in the skirt capable of being moved inwardly and outwardly without restraint. There is testimony by Long himself that he made such pistons in the summer of 1913 and used them in the car on which he made a trip from Hannibal, Missouri, to St. Louis, Missouri and back (Record, pages 97-101). In answer to Q. 8 Long asserts that he was in Hannibal from 1906 until 1913, but he remained there until 1917 (Q. 4; p. 65). His presence at Hannibal, therefore, does not fix the year 1913. The pistons operated satisfactorily on this trip to St. Louis, but the motor was torn down and abandoned, the pistons being sold as scrap.

Long was assisted in sawing the slots for these pistons by the witness Cotter and this witness corroborates

Long as to the construction and installation of these pistons (Record, pp. 23-27).

The weakness of the testimony by Long and Cotter is that neither of them has any way of establishing the year 1913. They testified in 1925, twelve years after the supposed test of these pistons. Long worked on a great many other pistons as appears from the record. His memory as to the particular year in which he tested a particular piston some twelve years prior to the time of testifying is not reliable, and the same must be said of the corroborating witness Cotter. There is no contemporary evidence of any character either physical or documentary.

Gulick testifies that pistons similar to his Exhibit 8 were successfully tried out in a Renault car in 1911. This Exhibit 8 piston includes both longitudinal and a horizontal slots. The motor was the property of the Excelsior Motor and Manufacturing Company, of Chicago, and according to Gulick's testimony he drove this Renault car to some road races at Elgin, Illinois, in August, 1911, and the pistons remained in the car until October, 1911.

For Gulick's testimony there is the corroboration of the witness Williamson that he made this trip with Gulick, but Williamson did not see the pistons. The witness Engle describes, in answer to Q. 20, record page 167, his work in sawing the longitudinal slot in the pistons, and he recognizes Exhibit 8 as looking like those which he put into Gulick's motor. He accompanied Gulick on the trip to the Elgin road races and the pistons operated satisfactorily, but some months later the top broke from one of the pistons. The witness Engle is somewhat hazy in fixing the date of these events, but the fact that he left the employment of the Excelsior company near the end of the year 1911 helps him to fix the date.

Gulick's case for the 1911 date, like Long's case for the 1913 date, is defective for lack of contemporaneous evidence, but it is superior to the Long case in that there is a somewhat better fixing of the time. The fact that both parties failed to push their inventions to commercial use or patent application casts doubt upon the success of the trials, as does the fact that both of them shortly junked the pistons. If it should be ruled that Gulick had no actual reduction to practice in 1911, it would follow also that Long had no actual reduction to practice in 1913. The evidence for Gulick is at least suf-

ficient to establish priority of conception, and if both parties be restricted in their respective early dates of 1911 and 1913 to conception, then Gulick is the first to reduce to practice upon the basis of the pistons similar to his drawing Exhibit 11 which were successfully tried out in a Buda car in the year 1914. That Gulick had a slotted or slit piston when he was associated with Amplex Motor Co. in 1914-1915 is testified to by Hoadley, who installed them, although he testifies to a slot down the center, and a groove below the lower ring (Record, pp. 110-111); he says the sketch, Exhibit 11, looks like the pistons, but this sketch is itself of much later date (Record, pp. 64-65). The testimony of Randall (Record, pp. 152-155) and the stipulated testimony of Duck (pp. 175-176) is stronger and shows that the pistons were successfully used in driving a car with a Buda motor. The date is fixed by the fact that the company went into receivership in November, 1914, and Duck left the company in the spring of 1915. The identify of the invention is primarily dependent upon the recollection of the witnesses.

While the matter is not entirely free from doubt, the burden of establishing priority was upon Long, and it is believed that Gulick has sufficiently proved actual reduction to practice in 1914. But even if Gulick were restricted to his 1917 filing date for reduction to practice he would still be first to reduce to practice. Long has no proofs of actual reduction to practice prior to Gulick's filing date, any better than Gulick's 1914 proofs.

It is held that Gulick is the prior inventor of the subject matter of count 4 being the first to conceive and having probably reduced to practice prior to Long's conception date. In any event, Gulick reduced to practice prior to reduction to practice by Long and would, therefore, be entitled to an award of priority on the ground that he was the first to conceive and the first to reduce to practice.

Priority of invention of the subject matter of the four counts in issue is awarded to Edward J. Gulick, the senior party.

Limit of appeal: August 2, 1928.

H. I. Houston,
Examiner of Interferences.

July 2, 1928.

PLAINTIFFS' EXHIBIT NO. 70-B.

Opinion of the Board in Interference No. 49,571.

(Filed January 27, 1934.)

Appeal No. 256. REH

Hearing: May 3, 1929

IN THE UNITED STATES PATENT OFFICE

BEFORE THE BOARD OF APPEALS

LONG v. GULICK

Patent interference No. 49,571 between the application of Elmer C. Long, filed Nov. 22, 1919, Serial No. 339,892; and application of Edward J. Gulick, filed Nov. 30, 1917, Serial No. 204,661. Pistons.

Messrs. Swan, Frye & Murray for Long.
Messrs. Evans & McCoy for Gulick.

This is an appeal from the decision of the Examiner of Interferences by the party Long on the award of priority to the party Gulick.

The invention involved is defined by four counts as follows:

1. A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion and separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being cooperably connected at their opposite ends to said cylinder engaging portion.

2. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

3. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges

in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

4. A one piece piston provided with a solid end portion and a skirt portion, said skirt portion having a longitudinally extending slot formed through the thickness of its wall, said slot extending from the rear edge of the skirt portion and forming adjacent disconnected portions in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

The invention relates to a piston of the split skirt type in which there is yielding means between the head and sections of skirt of the piston and piston pin supports are carried by the yielding means.

The filing date of the party Gulick is Nov. 30, 1917. The party Long offers testimony which he urges proves conception prior to Gulick's filing date. Long submits no additional brief analyzing the decision of the Examiner of Interferences, and, while Long's counsel was present at the hearing, no specific oral argument was presented along this line. We have carefully considered the decision of the Examiner of Interferences on this point and concur in his decision in holding that the evidence offered did not show conclusively that Long had established a date of conception prior to Gulick's filing date. We also concur in the opinion of the Examiner of Interferences that Gulick proved reduction to practice in 1914.

The decision of the Examiner of Interferences is affirmed awarding priority to Edward J. Gulick on the four counts.

PLAINTIFFS' EXHIBIT NO. 84.

Abandoned Application of Ray E. Day for Patent.

(Filed January 27, 1934.)

Hearing: March 5, 1924.

IN THE UNITED STATES PATENT OFFICE.

DAY v. LONG v. MAYNARD v. JARDINE v. GULICK.

PATENT INTERFERENCE No. 49,576.

MOTION TO DISSOLVE.

PISTONS.

Application of Ray E. Day filed January 10, 1923, Ser. No. 611,698.

Application of Elmer C. Long filed January 17, 1921, Ser. No. 437,690.

Application of Howard E. Maynard filed January 3, 1921, Ser. No. 434,467.

Application of Frank Jardine filed March 9, 1921, Ser. No. 450,898, renewal of application filed March 11, 1920.

Application of Edward J. Gulick filed November 30, 1917, Ser. No. 204,661.

Mr. Clarence E. Mehlhope for Day.

Mr. Herbert G. Fletcher for Long.

Messrs. Whittemore, Hulbert & Whittemore and Mr. J. King Harness for Maynard.

Messrs. Richey, Slough and Watts for Jardine.

Mr. Ray S. Gehr for Gulick.

The party Long moves to dissolve on the ground that the count is unpatentable in view of the patents to

Spillman and Mooers, 1,029,870, Apr. 14, 1914, and

Ebbs, 700,309, May 20, 1902.

The count is as follows:

A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in

the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

The Spillman patent shows all the elements of the count except the connecting flanges in the zone of the bosses extending from the bosses to the skirt on both sides of the bosses and the longitudinal split in the skirt portion.

The first missing limitation would require connecting flanges between the pin bosses 12 and the skirt 2 of the patent substantially above the connections shown in Figures 2 and 3 and in a zone or circumferential belt which would include the bosses. This is a material limitation having a useful function.

The second missing limitation is not new in itself since the Ebbs patent shows a longitudinal split in the skirt but in cooperation with other elements not found in the Ebbs patent, it is a part of a new combination. It is noted that the claim was allowed to Gulick by the primary examiner after consideration of both patents cited.

The count is not satisfactorily anticipated by either reference or any reasonable combination of the references.

The motion is denied.

I. P. DISNEY,
Law Examiner.

SERVICE DEPARTMENT BULLETIN

Sheet No. 262

LONG TYPE PISTONS.

After April 15 the Service Department will be able to furnish Long Type Pistons in the standard size. These are straight pistons with two to three thousandths clearance. Their weight is approximately the same as the standard piston.

While these pistons have not proved satisfactory in production, we find that they work out very well when used in slightly worn cylinders; cylinders that are not worn more than .005 to .006 inch. If the cylinders are worn more than this they should be rebored. Long Type Pistons will be sold at the same price as the standard piston; viz, $8.50 list, complete with wrist pins, and rings, subject to the regular discount. Oversize, Long Type pistons cannot be furnished.

DEFENDANTS' EXHIBIT D.

Seven Paragraphs from Service Department Bulletin, Sheet No. 289, November 11, 1920, of Franklin Automobile Company, entitled "New Design for Series Nine."

(Filed January 9, 1933.)

SERVICE DEPARTMENT BULLETIN

Sheet No. 289.

NEW DESIGN FOR SERIES NINE

The distinct advantage as a material for pistons which an aluminum alloy with its very light weight and great ability to throw off heat has over cast iron, is conceded by all automobile engineers.

All of the Series 9 cars have been equipped with pistons made from this material and are giving satisfactory service. The Franklin design of these pistons as used in the past has been of the most up-to-date. The one disadvantage connected with their use has been the clearance which has been necessary between the pistons and walls of the cylinders.

Aluminum expands with the application of heat much more than cast iron, and for that reason in the past our pistons have required much more clearance to take care of this feature. This excessive clearance, particularly with a cold motor, has a tendency to make it noisy, to say nothing of affording an opportunity for the escape of gasoline past the rings and into the base, and also allowing an excess amount of oil to work up beyond the rings.

The Franklin engineers, however, realizing the particularly desirable features of the aluminum alloy piston have for the past three years been conducting exhaustive experiments with a view of securing a design such that the undesirable features would be eliminated. That has been accomplished. A new design has been perfected whereby we are now enabled to fit our aluminum pistons with two to three-thousandths clearance. This is the same amount of clearance as would be required for cast iron pistons in Series 9 motors. All motors going through production at this time are being fitted with this new piston known as the Long Piston and a more quiet motor with slightly increased ability is the result.

Fully realizing the fact that with the installation of this Long Piston in Series 9 motors already in service the same improved operation may be obtained to the present

owners, the Service Department has made the necessary preparations and is in position to supply this same piston in standard size, and can furnish it to you in the .015" and .030" oversize to take care of the overhaul work.

This new piston is a distinct improvement. We do not contemplate replacing the earlier type pistons in motors already out, except at owners' expense. Sell it to your owners with that idea in mind.

The price is $6.50 list for piston with wrist pin only.

DEFENDANTS' EXHIBIT H.

Article from Franklin Service Bulletin No. 348, April 18, 1922, of Franklin Automobile Company, entitled "The Oval Type Piston."

(Filed January 27, 1934.)

FRANKLIN SERVICE BULLETIN

"To Reduce the Cost and Improve the Quality of Service"

Franklin Automobile Company, Syracuse, N. Y.

No. 348 April 18, 1922

THE OVAL TYPE PISTON

A piston which is ground oval in shape and for this reason known as the oval type piston has been going through production in small quantities since last Summer. The results being obtained with this piston are so successful that it may be adopted for standard production. In order to best understand what the oval

type piston is it is necessary to know some of its specifications:

	Oval Type	Long Type
Length of piston	4"	4- 1/16"
Length of piston skirt	2-13/16"	2-31/32"
Length of piston above wrist pin	2⅜"	2-15/32"
Circumference of piston	oval	round
Shape of piston	tapered	straight
Clearance at the diameter perpendicular to wrist pin		
At bottom of skirt	.003	.005
At top of skirt	.005	.005
Clearance in line with wrist pin		
At bottom of skirt	.012	.005
At top of skirt	.014	.005

The oval type piston has several advantages over the straight and round type of piston. Principal among them are:

1. The oval piston has a clearance of only .003 to .005 of an inch over a distance of 1¼ inches on each side of the piston at the diameter perpendicular to the wrist pin. This gives the oval piston the advantage of a close fit, but the tendency for tightening of the piston of the wrist pin due to friction between the cylinder and piston is avoided because of the much greater clearance at all other points.
2. The increased size of the combustion chamber due to the oval piston being 3/32 of an inch shorter from the center line of the wrist pin to the top of the piston reduces the tendency for pinging.

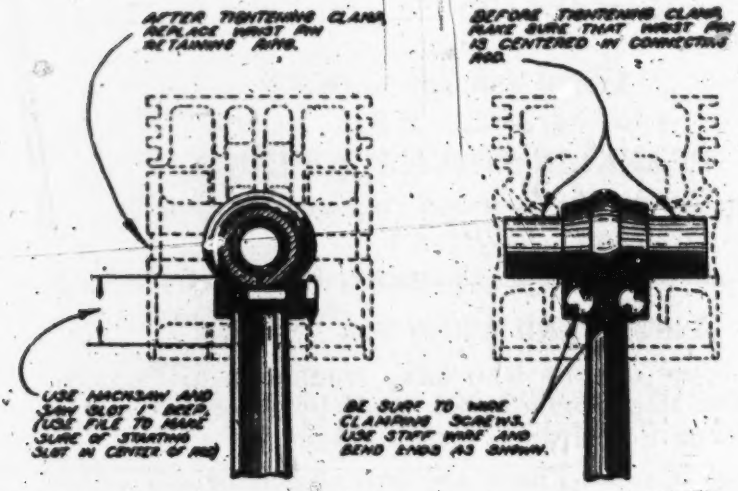
PISTON AND WRIST PIN KNOCKS

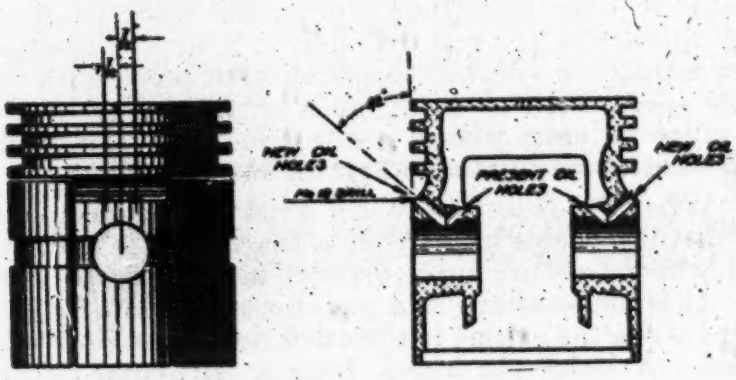
For those dealers who have trouble in distinguishing a piston slap from a knock made by a loose wrist pin, the following descriptions will be helpful.

Piston Slaps.—There are two characteristic piston noises, one known as a "slap" and the other as a "ping." A slap is more noticeable when the engine is cold and tends to disappear when the engine is hot. A "ping" doe not appear until the engine is hot. A slap gives a much sharper noise than a ping, and since a slap usually appears in but one cylinder, it is of less frequency than a ping. A constant application of power at a moderate speed, such as going up a slight incline at 18 or 20 miles an hour with a cool engine, will bring out a slap more distinctly than anything else.

Wrist Pin Knocks.—Worn wrist pins cause a slight but distinct double knock that is heard only at low speed, and which becomes more distinct as the engine warms up. It is not so sharp as a piston slap and can be easily heard when the engine is throttled down to a slow idling speed. A wrist pin knock from a particular cylinder disappears if the compression is relieved by removing the spark plug.



INSTALLATION OF WRIST PIN CLAMP.



LOCATION OF NEW OIL HOLES IN SERIES 10 PISTON.

DEPARTMENT OF COMMERCE

UNITED STATES PATENT OFFICE

To all persons to whom these presents shall come, Greeting:

THIS IS TO CERTIFY that the annexed is a true copy from the records of this office of the Petition, Specification, Oath and Drawing, as originally filed, in the matter of the Forfeited and Abandoned Application of William M. Venner, filed April 12, 1920, Serial Number 373,340, for Improvement in Pistons.

IN TESTIMONY WHEREOF I have hereunto set my hand and caused the seal of the Patent Office to be affixed, at the City of Washington, this sixteenth day of September, in the year of our Lord one thousand nine hundred and thirty-one and of the Independence of the United States of America the one hundred and fifty-sixth.

THOMAS E. ROBERTSON,
Commissioner of Patents.

(Seal)

ATTEST:

D. E. WILSON,
Chief of Division.

(Mail Room Apr 12 1920 U. S. Patent Office.)

(U. S. I. R. Documentary Stamp 25 Cents.)

Application for U. S. Letters Patent

PETITION.

To the Commissioner of Patents:

Your petitioner, William M. Venner, a citizen of the United States, residing at South Bend, in the County of St. Joseph and State of Indiana, and whose post-office address is 316 Hamden Court, in said city, prays that

Letters Patent may be granted to him for the improvement in Pistons set forth in the annexed Specification.

And I hereby appoint GEORGE J. OLTSCH, 711-12 Studebaker Building, South Bend, Indiana, U. S. A., Register No. 9371, Attorney, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to sign my name to the drawings, to receive the Letters Patent, and to transact all business in the United States Patent Office connected therewith.

Signed at South Bend, in the County of St. Joseph and State of Indiana, this 8th day of April, 1920.

☞ (Sign here
First name in Full.) WILLIAM M. VENNER.

SPECIFICATION.

To All Whom it May Concern:

BE IT KNOWN, That I, William M. Venner, a citizen of the United States, residing at South Bend, in the County of St. Joseph, and State of Indiana, have invented certain new and useful improvements in Pistons, of which the following is a specification:

373340—1

The invention relates to pistons and has for its object to provide a piston especially adapted for use in air cooled internal combustion engines, and to provide a piston so constructed that the use of aluminum and other light metals may be accomplished, thereby giving lightness of reciprocating parts, which metals have a greater relative degree of expansibility than the cylinder casings under the same temperature. Pistons of aluminum and alloys on account of their relative greater degrees of expansibility than the cylinder casings tend to seize the cylinders under high temperatures unless considerable clearance is provided and too much clearance is impractical, as the pistons will slap under low temperature, therefore it is the primary object of the invention to provide a skirt for the piston formed in sections, which sections are supported by downwardly extending webs, which webs are spaced apart at their bottoms and so constructed that they will have a relatively narrow width in proportion to their length so that the expansion of the webs will be more in the direction of their length than width. The lengthwise expansion

being unlimited thereby the web supported skirt sections will not seize the cylinder.

With the above and other objects in view the invention resides in the combination and arrangement of parts as hereinafter set forth, shown in the drawings, described and claimed, it being understood that changes in the precise embodiment of the invention may be made within

the scope of what is claimed without departing from the spirit of the invention.

In the drawings:—

Fig. 1 is a side elevation of the piston.

Figure 2 is a vertical sectional view taken on line 2—2 of Figure 1.

Figure 3 is a horizontal sectional view taken on line 3—3 of Figure 2.

Referring to the drawings, the numeral 1 designates a piston and 2 the head thereof. The head 2 is provided with a plurality of piston ring grooves 3 for the reception of piston rings of any conventional form. The piston is made from aluminum or any other light metals, or from any metal which has a greater expansibility than the cylinders in which it may be used. Pistons of this character in the past, on account of their greater expansibility than the cylinders ~~on~~ in which they are used have been found, when subjected to extreme temperatures, to bind or seize the bore of the cylinders, and where sufficient clearance has been allowed in the skirt of the piston under low temperatures the piston slaps. To overcome the above object the skirt 4 of the piston is slit as at 5 and 6 so as to form skirt sections 7, which sections form a major area entirely separated from the remaining wall sections 8 of the skirt 4. The adjacent edges of the skirt sections so formed being spaced from each other so as to allow independent movement when the piston is subjected to high or low temperatures.

The head 2 of the piston is provided with a cham-

ber 9 and depending downwardly from said chamber and integrally connected to the head 2 are webs 11 and 12. Webs 11 extend downwardly and are integrally connected to the skirt sections 8 and merge into bearings 13 for the wrist pin. The webs 12 extend downwardly and outwardly and are of greater length than width and have integrally connected to their ends the

skirt sections 7. It will be seen that by having the web sections 12, independent of each other and of greater length than width, that when the piston is subjected to high temperatures the expansion of the webs will be more in the direction of their length than in the direction of their width and that the length-wise expansion may be of any degree without causing the skirt to seize the cylinder. It will also be seen that by having the major area of the skirt in the skirt sections 7 which are entirely separated from the remaining skirt portions 8 and the major area sections 7 being supported entirely by the elongated webs 12 integrally formed with the head 2 of the piston, that the expansion will be longitudinally and not laterally, thereby maintaining a snug fit of the piston as a whole during high or low temperatures so as to overcome the difficulty at present experienced where pistons are made of aluminum or other metals, which have a greater expansibility than the cylinder. By providing supporting webs for the skirt sections, which webs are of greater length than width so that expansion of the webs will be lengthwise, the difficulty heretofore experienced in split skirts for pistons is obviated.

The invention having been set forth what is claimed as new and useful is:—

1 The combination with a piston head, of a skirt therefor, said skirt being formed from independent sections, and webs carried by the piston head and supporting the independent sections, said webs being of greater length than width, thereby insuring longitudinal expansion and contraction.

2 The combination with a piston head, of a skirt therefor, said skirt being formed in sections, some of said sections being carried by the piston head, the other sections being independent, the independent sections being supported by webs carried by the piston head, said webs being of greater length than width so that they will expand and contract longitudinally.

3 The combination with a piston head, of a skirt therefor, said skirt being formed in sections, some of said sections being integrally connected to the piston head, the other sections being independent of the piston head, and downwardly extending webs carried by the piston head and supporting the independent sections, said webs being of greater length than width, thereby

causing longitudinal expansion of the webs when subjected to heat.

4 The combination with a piston head, of a skirt therefor, said skirt being formed in sections, some of said sections being carried by and integrally joined to the piston head, the other sections being independent of the piston head, downwardly and outwardly extending webs carried by the piston head and supporting the independent sections, said webs being of greater length than width so as to insure longitudinal expansion and contraction.

373340—5

5 The combination with a piston head, of a skirt therefor, said skirt being formed in sections, some of said sections being carried by the piston head, the other sections being independently supported in relation to the piston head, webs carried by the piston head and supporting the independent sections, said independent sections comprising the major area of the skirt, said webs being of greater length than width thereby insuring longitudinal expansion and contraction.

6 The combination with the head of a piston, of a skirt therefor, said skirt being formed in sections, some of said sections being integrally connected to the piston head, the other sections being independent of the piston head, said independent sections comprising the major area of the skirt, and downwardly extending independent webs for supporting the independent sections, said webs being of greater length than width, thereby insuring longitudinal expansion and contraction.

373340—6

In Testimony Whereof I affix my signature.

William M. Venner.
(Sign here First name in Full.)

OATH

State of Indiana,
County of St. Joseph, ss:

William M. Venner, the above-named petitioner, being duly sworn, deposes and says that he is a citizen of (1) the United States, and resident of South Bend, Indiana; that he verily believes himself to be the original, first, and (2) sole inventor of the improvements in Pis-

tions described and claimed in the annexed specification; that he does not know and does not believe that the same was ever known or used before his invention or discovery thereof, or patented or described in any printed publication in any country before his invention or discovery thereof, or more than two years prior to this application, or in public use or on sale in the United States for more than two years prior to this application; that said invention has not been patented in any country foreign to the United States on an application filed by him or his legal representatives or assigns more than twelve months prior to this application; and that no application for patent on said improvement has been filed by him or his representatives or assigns in any country foreign to the United States.

☞(Sign here
First name in Full.) WILLIAM M. VENNER.

SWORN to and subscribed before me this 8th day of April, 1920.

ORLO R. DEAHL,
(Official Signature)
Notary Public.
(Official Character)

(Notarial Seal)

[Seal here, to be impressed in paper.]

My commission expires Mar 30, 1921.

☞NOTE.—Acknowledgment should be made before a Notary Public, *who must affix his seal.* If executed before an officer not provided with a seal, the Certificate of the Judge or Clerk of County Court must be affixed, showing official character of such officer.

DEFENDANTS' EXHIBIT L.

Letter from George J. Oltsch to Wm. M. Venner, dated September 22, 1920.

(Filed January 27, 1934.)

Sept. 22, 1920.

Mr. Wm. M. Venner,
2217 Locust St.
St. Louis, Mo.

Dear Sir:—

In the matter of your application for a patent on Piston, I am this day in receipt of a communication from the Patent Office advising that all of the claims as originally filed are deemed to be allowable with the exception of one claim, which leaves five allowable claims.

Claim 1 was rejected on British patent to Ricardo, No. 17,953, dated Dec. 23, 1915. Until I receive a copy of this patent, which has been ordered, I will not be able to determine as to the pertinency of said reference. Whether or not said claim is justly allowable, the allowed claims will afford you very good protection. The rejected claim was not limited in scope to a piston having a skirt portion made up of sections supported by webs extending from the head portion of the piston, while the allowed claims are limited to some of said sections being integrally formed with the head, and other independently supported by webs extending from the head. The latter as covered by your allowed claims appears to be the most practicable construction, and, if such should be the case, the claims allowed you will afford you ample protection.

I will take further action as soon as copy of the Ricardo patent comes to hand, and in the meantime you should decide whether you desire any foreign patents, and whether you desire an infringement search made, in order to be on the safe side, if you intend to market the piston. I am very much pleased to be able to submit such a favorable report.

Very truly yours.

DEFENDANTS' EXHIBIT N.

Article from Pages 8 and 9 of Manual for Trouble Shooters of Franklin Automobile Company, entitled "Piston Slap."

(Filed January 27, 1934.)

PISTON SLAP

A slap is more noticeable when the engine is cold and tends to disappear when the engine is hot. It gives a much sharper noise than a "ping" and since a slap usually appears in but one cylinder, it is of less frequency than a ping. A constant application of power at a moderate speed, such as going up a slight incline at 18 or 20 miles an hour with a cool engine, will bring out a slap more distinctly than anything else.

Slaps are due to the clearance allowed between the piston and the cylinder walls. A certain amount of clearance is necessary to take care of the expansion of the heated piston. (A piston gets hotter and expands more than a cylinder.) Aluminum pistons expand more than cast-iron or steel ones and since this extra expansion requires more clearance, they are more apt to slap. A slap that disappears after an engine is warmed up can do no harm and it is a waste of money to try to eliminate it. Often when such a slap is removed from one cylinder it will appear in another.

Three types of pistons have been used in Series 9 and 10 engines, "tapered," "straight," and "oval." The proper clearances for these are as follows:

Piston	Clearance at top of skirt	Clearance at bottom of skirt
Tapered	.008"	.003"
Straight	.005"	.005"
Oval	.005"	.003"

The original clearance of a piston and cylinder is given by the figures stamped on the head of the piston and on the bottom of the cylinder flange.

To determine which piston is slapping, run the engine at the speed at which the slap is most noticeable and then short circuit the spark plugs one at a time with a screw-driver. When the slapping cylinder is short circuited, the slap will be much less noticeable or will disappear entirely. Another method of locating a slap is to have the engine idling and then to open the throttle in short, sudden jabs, feeling each cylinder with the point

of a small screw-driver held just under the cooling fins as this is done. A distinct tap can be felt on the slapping cylinder. Another method is to use a long screw-driver as a "listening rod," placing the blade of the screw-driver against the cylinder and the handle against the ear. [The only remedy for a slapping piston is to install a larger piston or a smaller cylinder. If the cylinder should be too badly worn (over .005") to install a new piston, the cylinder can be reground by the factory for a nominal charge and an oversize piston installed.]

Digest of Defendants' Exhibit X.

Agreement, dated September 20, 1919.

Between E. C. Long and M. K. Weems.

Subject Matter:

E. C. Long business at 1037 and 1039 Main Street, Quincy, Ill., together with certain named machines, tools, supplies, etc. sold to M. K. Weems for $45,000.00.

Long licensed Weems to manufacture and sell pistons under each patent owned by Long and each Long application for patent then on file.

Weems agreed to pay Long a royalty of twenty (20) cents for each piston made or sold.

L. M. Stellman's Report, dated March 18, 1919, entitled "Test on Long Pistons."

(Filed January 27, 1934.)

March 18, 1919.

Z/RM

(Docket Division Dec 23 1927 U. S. Patent Office.)

TEST ON LONG PISTONS

Mr. Long, our dealer in Quincy, Ill., was out here with a new design of aluminum piston for our motor in connection with which he has had four claims allowed by the Patent Office. Several tests have been run in connection with this piston; the first being a set-up test on the block with baffle plates under the cylinders which did not give a sufficient amount of oil so but what a set-up was obtained in about nine minutes. This was a more severe test than we ordinarily give our regular production piston such as we are now using, and it is doubtful even if the pistons were undercut as we recommend them to be for use in the southwest would stand up under this test any longer than these pistons did. There was also a tendency toward too little oil. After this test, we decided to put these pistons on the road in a motor and consequently Mr. Long and the writer started out with a sedan equipped with new pistons, new rings and new cylinders which had never been run in together, the pistons having oil grooves cut circumferentially so as to give the pistons and ~~in~~ cylinder wall a little more oil than we had on the set-up test. These pistons and cylinders were placed on sedan demonstrator motor with spark plug holes undercut as regards to the threads, as per latest experiments, so as to cut down pre-ignition as much as possible, with which we have recently had trouble on production cars.

We carried four people and luggage, leaving Syracuse at 2:30 p.m., making Utica in an hour and twenty minutes, although it was scarcely possible to get over 40 miles an hour on the level with the car, due probably to the fact that neither the rings nor the pistons were run in at all. Power gradually improved although it was a very severe test to take a green motor and drive from Syracuse to Utica in an hour and twenty minutes. Also made the run from Syracuse to Albany in 4 hours and one-half, driving from Syracuse to Poughkeepsie in 6¾ hours of running time. This is a mileage of about

240 miles. During this comparatively high speed, the car got so it would hold 45 miles on the level continuously. One quart of oil was consumed in the total 240 miles. This oil consumption is very low, considering the speed which the car made. It has been the writer's experience that a normal production car would consume approximately one gallon of oil under the same conditions.

The run was continued to New York the next day where a day was spent at the Aeronautical Show. The next morning the oil was drawn off from the engine base, washed out, new oil put in, and we left Columbus Circle at 9 a.m., driving up through Connecticut, through Bridgeport, New Haven to Hartford, making 125 miles in 3½ hours. On this run, there was considerable comparatively level straight road and the car would hold 50 miles an hour against a slight head wind. During this run the Franklin kept ahead of a Cadillac coupe which was evidently bent on beating us to Hartford. After reaching Hartford, it was decided that it was practically impossible to set this car up under normal conditions on the level under temperatures encountered which were fairly cool, even though hot air was used both on suction yoke manifold and carburetor intake. Therefore we decided to take the car up into the Vermont hills through mud roads. We drove the car 120 miles on low and second gear work over roads that were axle deep with mud, so deep that we scraped the flywheel boot off. While it was possible to get the motor to pre-ignite so that the engine would lose power badly and it would be necessary to drop into a lower gear; as soon as this was done, the engine speed was allowed to pick up, pre-ignition would disappear and the motor would run apparently in excellent shape. With regular production motor or cast iron pistons if pre-ignition was obtained as it was in this car, the motor would, in the writer's opinion set up when shifted to lower gear and speed increased. During this 120 mile drive in the mud, sedan was carrying one thousand pounds dead load. The remainder of the trip was completed back to Syracuse over the Mohawk trail, coming up the long grade on the east side of Hoosick Mountain with about 3" of soft snow. The whole grade was negotiated in second gear except when the pre-ignition got so great that it was necessary to drop into low gear for a short period of time. The last 150 miles was run in 4¼ hours running time. The total oil consumption from the time we left New York, during all our low and

second gear and hard work, was at the rate of 680 miles to the gallon.

From this test it would look as if it might be desirable to change the baffle plates slightly from those used on this motor so as to allow the motor to use more oil at low speeds. The gasoline consumption for the total 970 miles averaged 15 miles to the gallon which would seem to be very good considering the speed and the condition of the roads. It seems to the writer as if this piston was operating satisfactorily and would run in a perfectly satisfactory manner. The only question would be as to how the performance in regard to pre-ignition and loss of power would be in the southwest where the temperatures encountered are considerably higher. On examining the pistons after the motor was torn down, there was no trouble encountered with scores or roughness on the piston, but the cylinders were slightly scored in a vertical direction. This probably was due to starting the motor out and running under extremely hard conditions without first running pistons and cylinders together.

L. M. Stellman.

DEFENDANTS' EXHIBIT AA.

Digest of Defendants' Exhibit AA.

License Agreement, dated March 20th, 1919.

Between Elmer C. Long of Quincy, Illinois, and the H. H. Franklin Manufacturing Company, of Syracuse, New York.

Subject Matter:

Elmer C. Long grants a non-exclusive license to the Franklin Company under Long Application for Patent, Serial No. 281,175 and under all patents and applications owned or thereafter acquired by Long.

The Franklin Company agrees to pay Long a royalty of twenty (20) cents for each of the first thirty thousand (30,000) pistons made and sold, fifteen (15) cents for each of the next thirty thousand (30,000) pistons made and sold, and ten (10) cents for each piston made and sold thereafter.

PISTON DESIGN.

By Harry R. Ricardo, B.A., A.M.I.C.E.

IN the March issue of *The Automobile Engineer* last year the writer gave a description of a design of aluminium piston which he had employed with considerable success. In this design a serious attempt was made:

(*a.*) To reduce the weight by disposing the material in such a way that the load was transmitted as directly as possible from the crown to the gudgeon pin and from the gudgeon to the bearing surfaces.

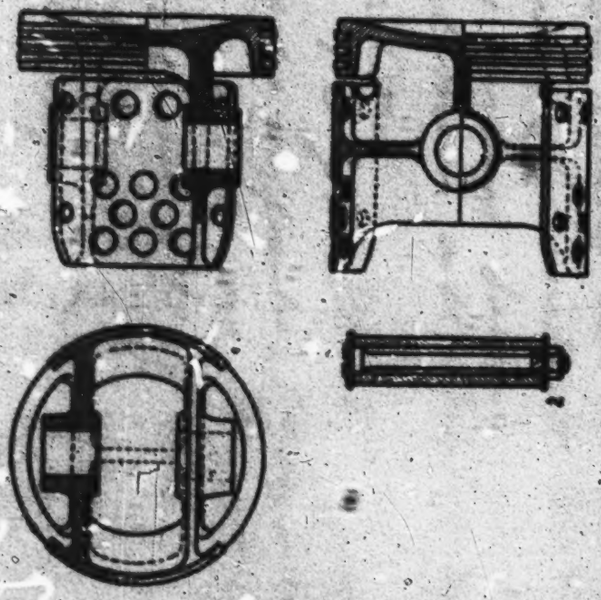

Fig. 1.
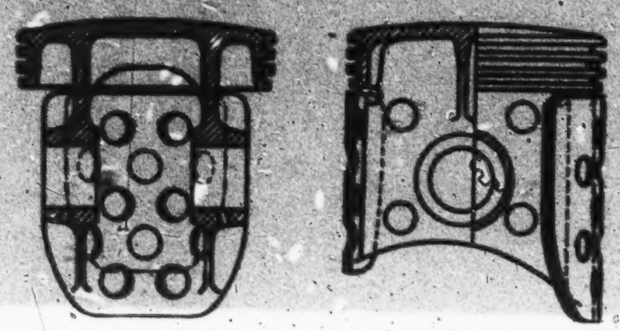
Divided slipper piston design for bores up to 5in.

(*b.*) To reduce the area of rubbing surface, thereby reducing the fluid friction of the lubricant.

(*c.*) To reduce the oil consumption and the tendency to carbonise the oil by giving free vent for the lubricant, and thus preventing it from being "rolled up" between the piston and cylinder walls, which was found to be the chief cause of oil reaching the combustion chamber.



(*d.*) To reduce the bending of the gudgeon pin by transmitting the load to it at points as near the centre as the width of the connecting rod small end bearing would permit.

Since that date a very considerable number of these pistons have been made and tested in engines of various kinds, and as a result it has been found that:

(1.) Such pistons complete with gudgeon pins and piston rings are actually about 30% lighter than aluminium pistons of the normal design and of the same thickness of crown.

(2.) The piston friction is actually about 35% less than in the case of a normal trunk piston of the same size and material.

(3.) The oil consumption is lower than in the case of an ordinary trunk piston, and the tendency to carbonise is less.

(4.) The use of a short floating gudgeon pin renders possible a very substantial reduction in the weight of the pin, for not only is the rigidity of the pin greatly increased, with the result that both the diameter and length of bearing surface can be substantially reduced without any measurable wear being detected, but also the rotation of the pin prevents any tendency to unequal or local wear. This is a very important point, for not only do these short floating pins show much less wear than the ordinary type, but also in these very light pistons the weight of the gudgeon pin itself and the small end bearing of the connecting rod constitute a serious proportion of the total reciprocating weight.

This piston, however, in common with all other aluminium pistons, requires a considerable allowance for expansion, with the result that it is liable to be somewhat noisy when cold. In order to reduce the amount of clearance necessary, the writer has recently patented a design in which the connection between the ring-carrying portion of the piston and the slipper surface is severed, so that heat can only be conducted to the slipper surfaces by way of the main webs and not down the sides. The main webs themselves are so designed that the heat conducted from the crown is distributed evenly over the surface of the slippers. The effect of this design is that the bulk of the heat is delivered to the cylinder walls through the piston rings, while only a comparatively small portion reaches the slipper surfaces, and this is distributed evenly over them. Such a design would not be suitable for very large

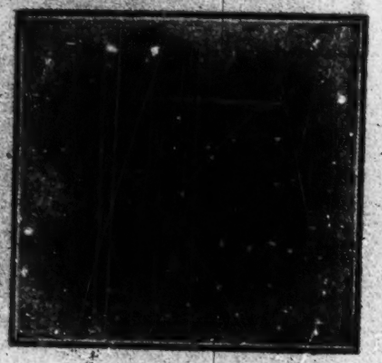


Fig. 2.

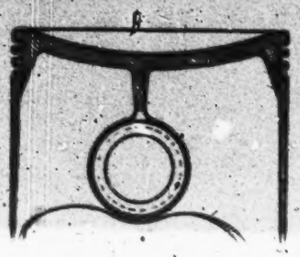
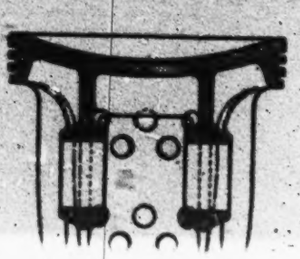
engines on account of the reduced facilities for dissipating the heat from the crown, but for pistons up to 5in. bore at any rate it appears to be quite satisfactory. Experience has shown that with these divided-slippers the clearance necessary can be reduced to about one-half of that required for the ordinary type, and to little, if any, more than is required for a cast iron piston. Such a piston of 4in. bore is shown in fig. 1. Several of these pistons have been in use in motor car engines, and their quiet running has been most noticeable.

Fig. 2 shows a further development, in which the bearing surface on the side which does not receive the maximum thrust from the connecting rod has been yet further reduced, and also the main webs





of the lubricant.

(c.) To reduce the oil consumption and the tendency to carbonise the oil by giving free vent for the lubricant, and thus preventing it from being "rolled up" between the piston and cylinder walls, which was found to be the chief cause of oil reaching the combustion chamber.

these very light pistons the weight of the gudgeon pin itself and the small end bearing of the connecting rod constitute a serious proportion of the total reciprocating weight.

This piston, however, in common with all other aluminium pistons, requires a considerable allowance for expansion, with the result that it is liable to be somewhat noisy when cold. In order to reduce the

for the ordinary type, and to little, if any, more than is required for a cast iron piston. Such a piston of 4in. bore is shown in fig. 1. Several of these pistons have been in use in motor car engines, and their quiet running has been most noticeable.

Fig. 2 shows a further development, in which the bearing surface on the side which does not receive the maximum thrust from the connecting rod has been yet further reduced, and also the main webs

Decision of Law Examiner, dated April 4, 1924 in Interference No. 49,569.

(Filed January 27, 1934.)

Hearing: March 10, 1924. kse

IN THE UNITED STATES PATENT OFFICE.

Day vs. Taylor vs. Maynard vs. Jardine vs. Hartog vs. Long vs. Gulick.

Patent Interference No. 49569.

Motion to Dissolve. Motion to Amend.

Pistons.

Application of Ray E. Day filed Jan. 10, 1923, No. 611,-698.
Application of George A. Taylor filed June 17, 1922, No. 569,104.
Application of Howard E. Maynard filed Jan. 3, 1921, No. 434,467.
Application of Frank Jardine filed Mar. 9, 1921, No. 450,-898, renewal of application filed Mar. 11, 1920, No. 364,997.
Application of Stephen D. Hartog filed Feb. 16, 1920, No. 359,137.
Application of Elmer C. Long filed Aug. 13. 1919, No. 317,273.
Application of Edward J. Gulick filed Nov. 30, 1917, No. 204,661.

Mr. Clarence E. Mehlhope for Day.,
Messrs. Macleod, Calver, Copeland & Dike for Taylor.
Mr. J. King Harness for Maynard.
Messrs. Richey, Slough & Watts for Jardine.
Messrs. Rippey and Kingsland for Hartog.
Mr. Herbert G. Fletcher for Long.
Mr. Ray S. Gehr for Gulick.

The party Hartog moves to dissolve and the party Gulick moves to amend.

The issue is defined in a single count which is as follows:

> A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

Hartog's motion denies the right of Gulick and Hartog to make the count. As to Gulick it alleges that in his disclosure there are no walls separate from the head portion "integrally uniting said bosses." The quoted excerpt from the count has an apparent meaning which is different from the necessary meaning dependent upon the context. The complete phrase is "walls integrally uniting said bosses, the guide portion and the head portion" which means nothing less than that the bosses, guide portion and head portion are integrally united by walls. In Gulick's drawings the bosses 16, the guide portion 11, and the head portion 10 are integrally united by walls 17, 18, 20. This structural arrangement satisfies the requirement of the count.

As to Hartog a similar allegation is made to the effect that Hartog's disclosure does not have "walls integrally uniting said bosses," but it is plain in Figs. 1 and 4 of Hartog that walls 12 integrally unite bosses 13, guide portion 11 and head portion 10. It follows that Hartog's motion must be denied.

The amended motion to amend by Gulick presents claims 34 to 47 which are as follows:

> 34. A one piece piston having a solid end portion and skirt portion which is adapted to engage the entire circumferential wall of the cylinder in which it reciprocates, said piston being provided with an annual slot cut entirely through the thickness of its peripheral wall, a pair of wrist pin bearings, connecting means extending from said solid end portion to said bearings, said skirt portion having a slot cut entirely through the thickness of its peripheral wall extending from one end of the pis-

ton to said annular slot, and connecting means extending from each of said bearings to said skirt portion.

35. A one piece piston having a solid end portion and a skirt portion which is adapted to engage the entire circumferential wall of the cylinder in which it reciprocates, said skirt portion being provided with an annular slot, a second slot extending from one end of said skirt portion to said annular slot, said slots being cut entirely through the thickness of the peripheral wall of the skirt portion, a pair of wrist pin bearings, and integral means depending from the solid end portion of the piston to said bearings and said skirt portion for the support of said skirt portion.

36. A piston comprising a head, a skirt separated therefrom by a continuous transverse slit, a longitudinal slit extending from the latter to the lower edge of the said skirt, and means for connecting the portions of the skirt which bound said longitudinal slit with said head.

37. A piston having a head and body parted from each but held integrally connected with each other by internal yielding ribs, a slit cut through the body providing means for expansion and contraction of said body.

38. A piston having a head and a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

39. A piston as claimed in claim 38 characterized by being integrally cast.

40. A piston as claimed in claim 32 characterized by being integrally cast.

41. A piston comprising a head, a cylindrical skirt beneath said head, parallel webs extending downwardly from said head and connected to said skirt whereby recesses are provided between the lower ends of said webs and said skirt and between the upper ends of said skirt and said head, one side of said skirt between the points of attachment of said webs thereto being slitted longitudinally, and wrist pin bearings carried by said webs.

42. In a piston for an internal combustion engine, the combination of a head provided with ring grooves therein, a pair of webs integral with and dependent from said head and located opposite each other, diametrically oppositely disposed wrist pin bosses, one in each of said webs, a skirt for said piston, integrally connected to each of the side edges of the webs, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

43. In a piston for an internal combustion engine, the combination of a head and a pair of cordal webs substantially rectangular in shape, located opposite each other in the piston and connected integrally at their upper edges to the piston head, diametrically oppositely disposed wrist pin bosses, one in each of said webs, and a skirt for said piston integrally connected to each of the side edges of the webs, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

44. In a piston for an internal combustion engine, the combination of a head, webs integrally connected to said head and dependent therefrom, oppositely disposed piston pin bosses mounted one in each of said webs and integral therewith, a skirt for said piston, integrally connected to each of said webs and extending beyond the same, said piston being provided with circumferential slots between the head and skirt and with a longitudinal slot connecting one of said circumferential slots and the open end of the skirt of the piston.

45. In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of cordal webs integrally connected with the piston head and extending downwardly therefrom, oppositely disposed piston pin bosses, integral with said webs and mounted therein, a skirt for said piston longer than said webs and interconnected at the side edges of the webs to each of said webs, said piston being provided with circumferential slots between the head and skirt and with a longitudinal slot connecting one of said circumferential slots with the open end of the skirt.

46. In a piston of the class described, a cup-like head comprising a pressure receiving end and a wall portion, a skirt circumferentially disconnected from the wall portion of the head and divided from end to end, and skirt carriers connecting said skirt to the pressure receiving end, said skirt carriers being disconnected from the wall portion of the head and susceptible of being slightly flexed radially.

47. A piston comprising a head, a skirt having resilient sections separated from said head by a slit extending continuously around the piston, and means for yieldingly connecting said skirt sections with said head.

Claims 34 and 35 are copies of Long's claims 4 and 7 in his application No. 317,273. They appear to be unpatentable over the patent to Spillman No. 1,092,870 or the French patent to Chenard No. 468,595 of 1914, in view of the patent to Ebbs No. 700,309. The French patent and the Spillman patent show all that is claimed except the longitudinal slot which is found in Ebbs and can accommodate circumferential thermal expansion.

Claim 36 is the same as claim 13 of Long which defines no patentable novelty over the patent to Ebbs No. 700,309. The portions of the skirt which bound the longitudinal slit are not necessarily closely adjacent to the slit, and in Long's disclosure the connecting means 11 is not closely adjacent to slit 7.

Claim 37 is claim 4 of Hartog's application No. 359,137 and is not patentable over the issue in Interference No. 49570, the slit through the body portion being without novelty in view of Ebbs patent No. 700,309. Gulick can make this claim.

Claim 38 is the same as claim 20 of Hartog. Gulick can make it but it is not patentably distinct from the issue in Interference No. 49572.

Claim 39 would not be patentably different from claim 38 since it is common to make pistons of cast metal.

Claim 40 is similar to Hartog's claim 25, and like claim 39, would not be patentably different from claim 38.

Claim 41 is the same as claim 7 of Maynard Ser. No. 434,467. This claim does not distinctly define the invention it purports to cover and is objectionable because the structure recited prior to the "whereby" clause in line 3 is not sufficient to support the function stated in the

"whereby" clause. Merely extending parallel webs downward from the head to the skirt will not form any definitely located "recesses." Claim 42 is the same as claim 7 of Jardine No. 450,898. It can not be made by Gulick since he has not a plurality of ring grooves nor a plurality of circumferential slots. Claim 43 is the same as claim 8 of Jardine. It is not patentably distinct from claim 42. Gulick can not make it because he does not disclose a pair of cordal webs *substantially rectangular* in shape, and the circumferential *slots* between the skirt and the head.

Claim 44 is a copy of Jardine's claim 9. Since Gulick has not a plurality of circumferential slots he can not make it. Claim 45 is claim 10 of Jardine. Gulick can not make it for the same reasons that he can not make claim 42. Claim 46 is claim 19 of Jardine which is the issue of Interference No. 49578. It is very doubtful if Gulick's skirt carriers 17, 18, 20 are susceptible of being slightly flexed radially and it is held he can not make this claim. Claim 47 is claim 22 of Jardine which is the issue of Interference No. 49583, Hartog v. Jardine v. Spillman. It is not clear that Gulick can make this claim because his skirt is not divided into a plurality of resilient sections by a plurality of longitudinal slits. He has a single longitudinal slit and the skirt comprises a single integral device whose ends terminate at the edges of the longitudinal slit. In the pistons of Hartog, Jardine and Spillman the skirt is divided into sections by a plurality of longitudinal slits.

The amended motion to amend is denied for the reasons stated.

Hartog's motion is denied.

A limit of appeal from the decision on Gulick's amended motion is set to expire April 24, 1924.

I. P. DISNEY,
Law Examiner.

April 4, 1924.

DEFENDANTS' EXHIBIT 4-D.

Decision of Law Examiner, dated April 4, 1924, in Interference No. 49,574.

(Filed January 27, 1934.)

Hearing: March 4, 1924. AS

IN THE UNITED STATES PATENT OFFICE.

DAY v. TAYLOR v. LONG v. MAYNARD v. HARTOG v. GULICK.

PATENT INTERFERENCE No. 49,574.

MOTION TO DISSOLVE.

PISTONS.

Application of Ray E. Day filed January 10, 1923, Ser. No. 611,698.
Application of Geo. A. Taylor filed June 17, 1922, Ser. No. 569,104.
Application of Elmer C. Long filed January 17, 1921, Ser. No. 437,690.
Application of Howard E. Maynard filed January 3, 1921, Ser. No. 434,467.
Application of Stephen D. Hartog filed February 16, 1921, Ser. No. 359,137.
Application of Edward J. Gulick filed November 30, 1917, Ser. No. 204,661.

Mr. Clarence E. Mehlhope for Day.
Messrs. Macleod, Calver, Copeland and Dike for Taylor.
Mr. Herbert G. Fletcher for Long.
Messrs. Whittemore, Hulbert & Whittemore and Mr. J. King Harness for Maynard.
Messrs. Rippey and Kingsland for Hartog.
Mr. Ray S. Gehr for Gulick.

The parties Hartog and Long move to dissolve on the ground of non-patentability of the issue.

The single count of the issue is as follows:

> A piston closed at one end and open at its opposite end, said piston having an annular cutting formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt which is approximately cylinder bearing in its entirety, a

pair of wrist pin bearings depended from said piston end and being free from engagement with said skirt, supporting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the thickness of its wall and extending from the open end thereof to said annular cutting.

The party Hartog relies upon the following patents:

Derby & Kaiser, 1,053,790, Feb. 18, 1913,
Spillman & Mooers, 1,092,870, Apr. 4, 1914,
Ebbs, 700,309, May 20, 1902.

The party Long relies upon the same patents to Spillman and Mooers and Ebbs.

In the Derby patent it is not seen that the piston has an annular cutting formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt, and the longitudinal slot mentioned in lines 8 and 9 of the count does not extend in the Derby patent to "said annular cutting."

The patent to Spillman would anticipate the count if there is no inventive effort in forming the longitudinal slot in the skirt. The primary examiner has so held and the longitudinal slot is found in the patents to Ebbs or Derby.

The application of the Spillman patent to the count, except for the longitudinal slot, seems to be clear and requires no discussion. The count does not distinctly include any specific elements or relation of elements from which any functions not possible in the patents cited would flow and its scope may not be restricted beyond the fair and ordinary meaning of its terms.

The patent to Ebbs discloses all the elements of the count except a pair of wrist pin bearings depended from the piston end and free from engagement with the skirt.

It seems to be immaterial from a patentable standpoint whether the cross head has one relatively long bearing or two short bearings for the connecting rod wrist pins, and the cross head bearing is free from engagement with the parts of the skirt opposite to the ends of the bearing. The patent to Ebbs alone is a substantial anticipation of the count.

The motions are granted.

A limit of appeal is set to expire April 24, 1924.

I. P. Disney,
Law Examiner.

April 4, 1924.

DEFENDANTS' EXHIBIT 4-E.

Decision of Law Examiner, dated April 4, 1924, in Interference No. 49,580.

(Filed January 27, 1934.)

Hearing: March 5, 1924. kse

IN THE UNITED STATES PATENT OFFICE.

TAYLOR vs. LONG vs. HARTOG vs. GULICK.

PATENT INTERFERENCE No. 49580.

MOTION TO DISSOLVE.

PISTONS.

Application of George A. Taylor filed June 17, 1922, Ser. No. 569,104.
Application of Elmer C. Long filed Dec. 17, 1921, Ser. No. 522,974.
Application of Stephen D. Hartog filed Feb. 16, 1920, Ser. No. 359,137.
Application of Edward J. Gulick filed Nov. 30, 1917, Ser. No. 204,661.

Messrs. Macleod, Calver, Copeland & Dike for Taylor.
Mr. Herbert G. Fletcher for Long.
Messrs. Rippey and Kingsland for Hartog.
Mr. Ray S. Gehr for Gulick.

The parties Long and Hartog move to dissolve on the ground that the issue is unpatentable in view of the patent to Spillman and Mooers, No. 1,092,870, April 4, 1914.

The single count of the issue is as follows:

> A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses, integrally connected to the head and to the upper and lower part of the skirt, the outer ends of the pin bosses being spaced from the opposing parts of the skirt wall and said skirt having openings opposite the open ends of the bosses.

The patent clearly satisfies all the requirements of the count except the limitation that the pin bosses are to be integrally connected to the upper part of the skirt.

The pin bosses in the patent are obviously integrally connected to the head and to the lower part of the skirt, the latter connection at a point remote from the head, being designed by the patentee to avoid as much as possible the transmission of heat from the hot piston head to the skirt. The count gives no indication of any definite reason for connecting the pin bosses to the upper part of the skirt but the natural and obvious reason would be to reinforce or strengthen the connection between the pin bosses and the skirt. This is accomplished in Gulick's piston by elongating the attachment of the rib to the skirt at points adjacent to the skirt but any form of integral connection from the piston boss to the upper part of the skirt as well as to the lower part would be covered by the count. The point for decision is therefore reduced to the simple proposition: Is it patentable to connect the pin boss to the upper part of the skirt for any ordinary purpose, such as to reinforce the support of the skirt? If it should be found that the support of the skirt by connection to its lower part is insufficient, it seems clear that no more than common mechanical skill would be required to correct the defect and supply the remedy by additional connections or braces between the upper part of the skirt and the pin boss. It is true the advantage sought by the patentee would be lost in part but an adequate support for the skirt would be just as necessary as the avoidance of undue heating and the loss in one respect would be offset by the gain in the other. The idea of reinforcing or strengthening weak parts has been repeatedly recognized as requiring no inventive effort. *Turner v. Lauter*, 248 Fed., 931, 933. *Walker Mfg. Co. v. Illinois Brass Mfg. Co.*, 265 Fed., 279.

The motion is granted.

A limit of appeal is set to expire April 24, 1924.

I. P. DISNEY,

Apr. 4, 1924. *Law Examiner.*

DEFENDANTS' EXHIBIT 4-F.

Decision of Law Examiner, dated April 7, 1925, in Interference No. 49,575.

(Filed January 27, 1934.)

Hearing: March 20, 1925. kse

IN THE UNITED STATES PATENT OFFICE.

LONG VS. GULICK.

PATENT INTERFERENCE No. 49,575.

APPEAL FROM THE EXAMINERS-IN-CHIEF.

PISTONS.

Application of Elmer C. Long filed December 17, 1921, Ser. No. 522,974.
Application of Edward J. Gulick filed November 30, 1917, Ser. No. 204,661.

Mr. Herbert C. Fletcher for Long.
Mr. Ray S. Gehr for Gulick.

The party Long has appealed from the decision of the examiners-in-chief, affirming that of the examiner of interferences, awarding priority to the senior party, Gulick, for invention of the subject matter as defined in the following count:

> A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

A motion to dissolve was presented by Long to the law examiner on the ground that Gulick had no right to make the claim by reason of lack of disclosure. This motion was denied by the law examiner and judgments of priority by the tribunals below followed.

No testimony having been taken and Long being the junior party, the only question here to be reviewed is that of Gulick's right to make the claim involved in the issue.

The construction relates to a piston for a motor, preferably of the internal combustion type, in which there is a head and a separate skirt portion, the latter connected with the pin bosses on both sides by flanges. The skirt portion is split from top to bottom on one side and by virtue of such an arrangement free expansion and contraction of the skirt portion is obtained. Both parties have constructions which fall within the terms of the count but the party Long contends that the construction of Gulick is not such as to "permit free expansion and contraction of the skirt portion." The flanges of Long are set at an angle with respect to the pin bosses and for this reason Long contends that the skirt portion is free to expand and contract. The Gulick flanges are extended at right angles to the axis of the pin bosses and Gulick states that this results in a rigid construction between the pin bosses and the guide portion of the piston.

In the operation of a piston of this character in a gas engine there are wide changes in temperature with resulting expansion or contraction of the metal of the parts. The cylinder wall elongates in a line at right angles to the movement of the cylinder and this elongation, in the construction of both parties, is provided for by the slot in the skirt of each piston. The party Long contends that with his construction, the flanges move about their points of attachment to the bosses as centers and in that manner pull the expanding cylinder wall inward and prevent the binding or freezing of the piston in the cylinder. Since Gulick has stated that the connections between the bosses and the cylinder skirt are "extremely rigid," Long contends that such action as takes place in his construction is impossible with that of Gulick. Long further contends that this rigid connection would result, with Gulick's piston, in use, in the piston wall loosing its round shape and binding in or scoring the cylinder. An explanation is submitted by Long as to the result of an expansion of the cylinder wall of Gulick and the conclusion was pressed at the hearing that the skirt would tend to increase the piston diameter rather than decrease it at such time.

It is not believed that the result, stated by Long to follow the use of his piston, differs from that obtained in

the use of Gulick's piston. The material of which both types of pistons are made will readily yield to the small extent required to bring the piston skirt to the proper diameter and such yielding is so small as to be within the stress or elasticity limits of the material. It is believed substantially the same action takes place with the constructions of both parties and that in each instance the skirt will move the small distance permitted by the slot to accommodate itself to the pressure and stress conditions brought about by the temperature changes. It is doubted if, in either construction, the flanges move as indicated in Long's Figure 5, as if they were pivoted to the pin bosses. There would be some yielding throughout the length of the flanges unless these were made especially thin where they join the bosses. Likewise, in Gulick's construction, and it must be remembered the motion is extremely slight and measured in thousands of an inch, there would be stresses and yielding throughout the lengths of the flanges. It would seem clear enough the operation is substantially the same in the Gulick as in the Long construction. The expression "free expansion and contraction" must be interpreted in view of the disclosure of Long as well as that of Gulick. The count did not originate with Long. The term "free" must mean a movement which must overcome the resistance of the flanges to flexure in the construction of Long and when this is done, a similar interpretation makes the terms applicable to the construction of Gulick. It is believed plain the latter is entitled to make the count of the issue.

The party Long has urged that the count of the issue is unpatentable over the prior art upon which the count in interference No. 49,574, involving the same parties, was held unpatentable by the law examiner. No motion to dissolve as to the instant count was made and, except in a very clear case, the matter should not be considered at this time. It is noted, however, that while the count of the instant interference appears quite similar to that which constituted the issue of interference No. 49,574, yet the present count has two limitations not found in that of the dissolved interference. The first of these is that the flanges connect the pin bosses with the skirt on both sides of the bosses. The second restriction is that the single split is on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

The Spillman and Mooers patent, which was regarded as capable of modification in accordance with the Ebbs patent in order to anticipate the count of interference No. 49,574, does not disclose flanges connecting with the skirt on both sides, but the connecting member is in the form of an oppositely apertured cylindrical portion having a flared, more or less disk shaped bottom, which is connected to the skirt below the bosses. The functional limitation at the end of the count implies a yielding in the connecting flanges, as otherwise a skirt with a single slit would not be freely expansible and contractible. The disk shaped connector of Spillman and Mooers would have a stiffening or trussing effect on the skirt so that even if slotted as suggested in the count, the skirt would be substantially unyielding. It is believed the present count is patentable and that in so holding there is no inconsistency with the law examiner's decision in interference No. 49,574.

The decision of the examiners-in-chief awarding priority to the senior party Gulick is affirmed.

WM. A. KINNAN,
First Assistant Commissioner.

Aluminum Piston Design

This discussion divides the problem in two classes and then takes up the details of each class. The four points on which objections to these problems are based—wear, slaps, excessive oil consumption and crankcase dilution—are treated separately.

By E. G. Gunn

FROM a thermal standpoint aluminum pistons may be broadly divided into two classes:

(1) Those designed with the object of conducting the heat away from the head into the skirt and thence into the cylinder walls.

(2) Those designed with the object of partly insulating the skirt from the heat of the piston head.

Those in the first class are usually more or less conventional in design except that they have thicker walls, or ribs extending down from the head. They are generally used for high-duty engines. In these engines, which are usually of a rather large bore and comparatively low speed, the weight of the piston is secondary to its ability to keep the head from overheating, and piston slaps are not of much consequence. Therefore, for heavy-duty engines pistons of the first type seem logical. Sections of some of the types which come under the first group are given in Figs. 1, 2 and 3.

Passenger-Car Engines

For passenger-car engines the conditions are somewhat different. The duty is lighter and the bore usually smaller. This lessens the tendency toward excessive heat. Quietness being important, close-fitting pistons are desirable. Need for good accelerating ability and smoothness in operation makes lightness desirable. These considerations have led to much development work on pistons of the second type. The plan followed in most cases is to partially insulate the skirt from the piston head, thus minimizing the expansion of the skirt due to heat. Some of the ways of accomplishing this are shown in Figs. 4 to 11, inclusive.

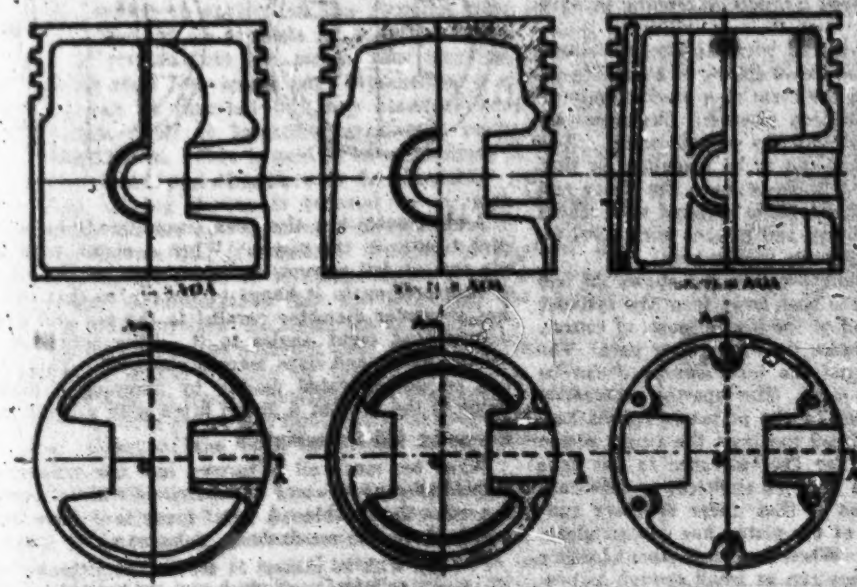
Pistons of the Long and Franquist type are split to allow the piston to spring. They run for this reason be fitted more closely than the more conventional types. The conventional type with the comparatively thin wall is probably the most popular, and for the smaller bores serves very well. It is simpler and somewhat cheaper to make than other types. In all the other types shown there has been an attempt to insulate the skirt from the head. This allows the piston to be fitted more closely, thus minimizing piston slaps.

Four points are often brought up as objections to the use of aluminum pistons. These objections are the same as those encountered in the use of cast-iron pistons.

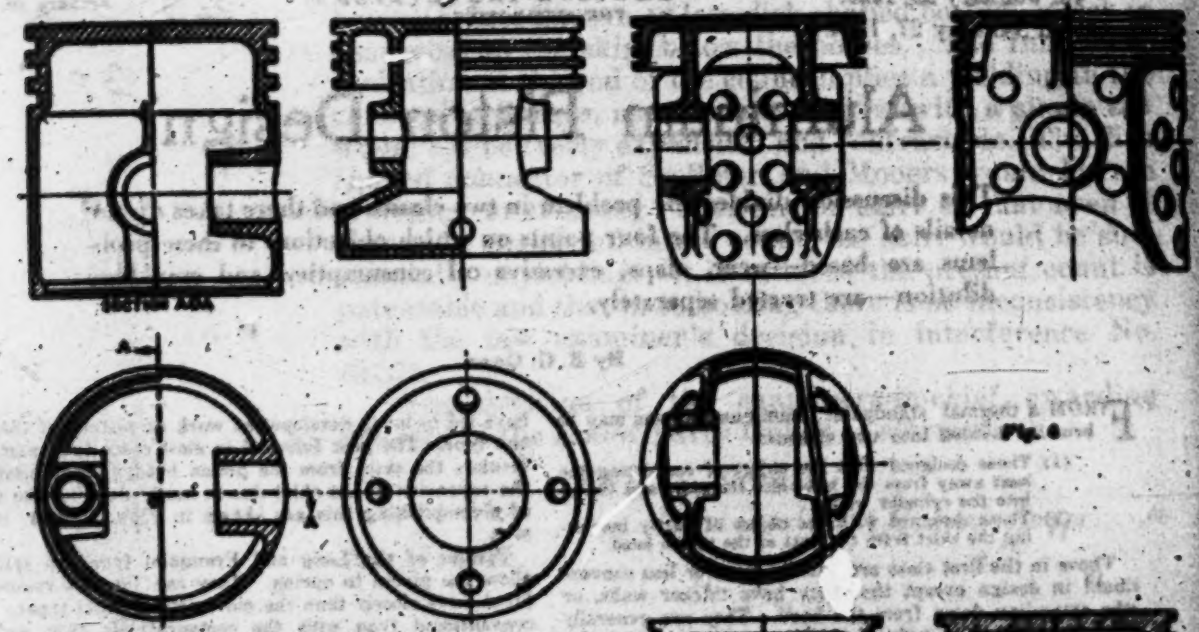
(1) Wear.
(2) Piston slaps.
(3) Excessive oil consumption.
(4) Crankcase dilution.

Wear has been shown to be largely a function of original smoothness. It is unreasonable to expect long life when aluminum pistons are fitted to cylinders of relatively hard material having a rough bore. Aluminum has been shown to be a good bearing metal, but it must run on a smooth surface, as in the case of babbitt metal. Much attention is paid to polishing the journals of a crankshaft, but we offer our cylinder bores, whether ground or reamed, which are so rough that they can be marked with a lead pencil, although they may appear to be smooth. This is undoubtedly the cause of a great deal of initial wear on aluminum pistons. When cast-iron pistons are fitted this is not so apparent. Dust in the air also plays a very important part in wear. Engines run on the dynamometer give much longer service than engines in cars.

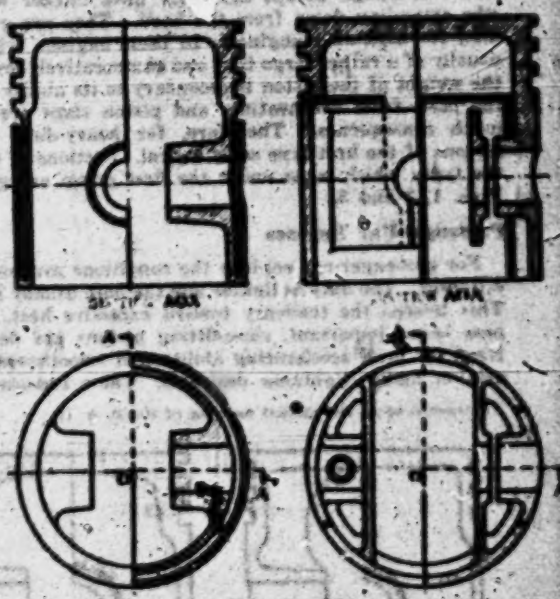
I have lately examined a truck piston with the top ring worn nearly in two, and with over 1/32-in. side clearance. The rings and piston were



Figs. 1, 2 and 3



Figs. 4 and 5



Figs. 7 and 8

both polished and showed no sign of scoring. This same model has repeatedly stood the same number of hours' running on test with wear so slight as to be hardly measurable. There is no question that an efficient air-cleaning device would greatly prolong piston and cylinder life.

Piston Slaps

Piston slaps can be overcome by using proper clearance. Pistons of the second design tend to make this condition easier to meet. Offsetting the piston-pin also tends to reduce piston slap. With 3½-in. and smaller bores there should be no trouble due to sticking with pistons of the conventional design fitted closely enough to prevent slap, provided the piston and cylinder are of proper design. There should be no local hot-spots, and care should be taken in the design to prevent a condition tending to warp the cylinder when heated.

Much trouble was experienced with sticking aluminum pistons in a certain inverted-sleeve engine of about 3½-in. bore. The cylinder was in the form of a block aluminum casting, with inserted cast-iron sleeves. Clearances up to 1/64 in. were tried, but still the pistons seized. The sleeves were removed and found to be machined so that there was an air-gap of 0.005 in. between the sleeve and the cylinder wall. These sleeves were replaced with others which fitted all the way down, and pistons with 0.007-in. clearance were then found to be satisfactory.

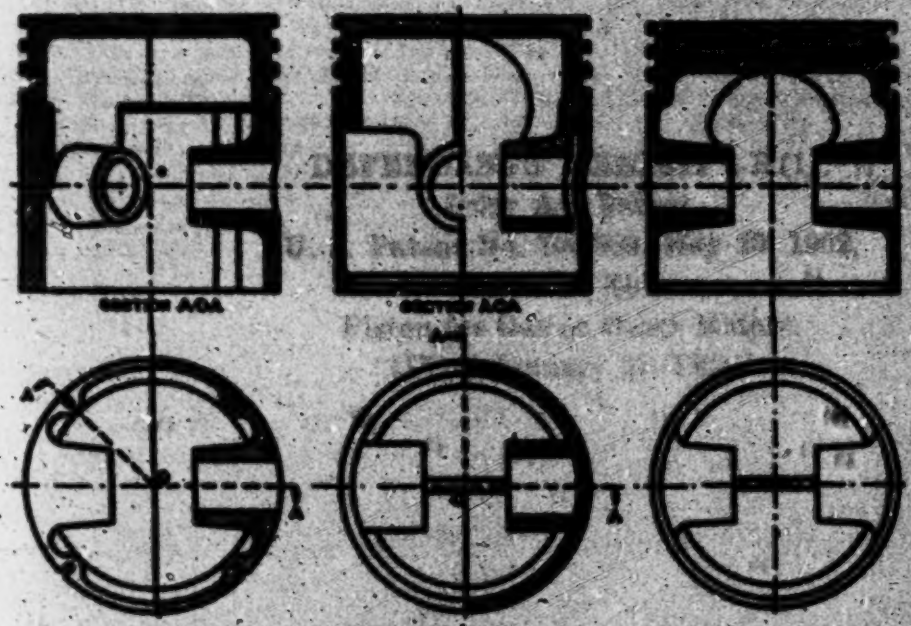
This is perhaps an exaggerated case, but shows the bad effect of failure to carry the heat away from the cylinder bore rapidly. The top land of the piston must, of course, be given much more clearance than any other part. The next land requires less, and the least clearance can be given to the bottom of the skirt. The tapering necessarily increases rapidly as the top of the piston is approached. When the piston-pin is placed too near the rings, piston slaps are more frequent, for the clearance in the zone near the piston-pin bosses must be sufficient to take care of extreme load conditions so that under ordinary running conditions this part of the piston has enough clearance to allow piston slaps. When the pin is placed further from the head the clearance can be small enough to prevent slaps.

Ring trouble has also been encountered, due to fitting pins tightly in the pistons. When a piston with a tight pin is heated it expands and creeps out on the pin; when it contracts again it hangs to the pin so that the piston has a greater diameter parallel to the pin and a smaller diameter at right angles to it. This condition makes sticking easier and slaps more pronounced. This creeping can be demonstrated readily by applying a blow-torch flame to the head of a piston fitted with a tight pin.

Excessive Oil Consumption

When too much oil is thrown into the cylinder bores, tight-fitting pistons and special rings will not completely overcome the trouble. A great many tests have been run which show this conclusively, demonstrating that:

(1) With no control on the oil being thrown into the cylinder, rings which seal the top and bottom edges of the groove reduced the oil consumption.



Figs. 8, 10 and 11

The engine was used run with a device arranged to limit the clearance to a compression of about 100 lbs. per sq. in. This was accomplished in such a way that the combustion volume of head was applied when idling. The effect upon fuel consumption was observed through a glass window and was clearly evident. The result was to diminish the amount of fuel in the oil-gas when idling, and the vibration was not seriously affected thereby.

Before the installation of the locking device a block developed was found on spark plugs taken from the cylinders of cars on road test even when the oil consumption was very low.

After the installation of the spark-plug mounted above under all conditions. It has been necessary practice for a number of years to put a quantity of kerosene in the crankcase oil when running in an engine to allow the bearing parts to run more quickly.

It is fair to expect that crankcase dilution has the same effect and that users could save fuel by the use of the locking device with unthinned fuel.

S. S. C. C. Steering Gear Lock

We show herewith an illustration of a novel lock which is applied to the steering gear of a car. The device consists of a spring detent, which is cast or riveted into the worm gear housing, and of a machine steel interruption part attached to a special shaft, which can be inserted into any desired steering wheel. The lock itself is located immediately underneath the steering wheel. This is said to have the advantage of additional convenience, and therefore to be particularly ...

This locking device is owned by Messrs. [illegible] Mr. H. Miller, and is being manufactured by the Miller Tools Service Co., Milwaukee. Samples of the lock are now being sold on Miller, White, Sterling and Grant cars, and we understand that the device has the approval of the Underwriters' Laboratories of Chicago.

This lock holds the steering gear fast in any angle, and therefore avoids driving of the front wheels. As you can see from the illustration, it does not interfere with [illegible] and the [illegible] of the steering wheel. The object of the lock, of course, is to prevent theft of the car.

In the illustration, A is a 10 machine bolt which holds the ring which is the proper position by screwing on the nut, B is a [illegible] and by turning and [illegible] device C and D. C is a steel ring attached to the ring A and by the spring at E. D is the spring [illegible] is rigidly or with [illegible] and F is the machine-steel [illegible], screwed into the tube C and secured with a [illegible]

UNITED STATES PATENT OFFICE.

HERMANN EDGAR EBBS, OF NUREMBERG, GERMANY, ASSIGNOR TO THE FIRM OF VEREINIGTE MASCHINENFABRIK AUGSBURG UND MASCHINENBAUGESELLSCHAFT NÜRNBERG A.-G., OF NUREMBERG, GERMANY.

PISTON FOR GAS OR OTHER MOTORS.

SPECIFICATION forming part of Letters Patent No. 700,209, dated May 20, 1902.

Application filed December 19, 1898. Serial No. 740,205. (No model.)

To all whom it may concern:

Be it known that I, HERMANN EDGAR EBBS, a subject of the Queen of Great Britain, residing at Nuremberg, Bavaria, German Empire, have invented certain new and useful Improvements in Pistons for Gas or other Motors, of which the following is a full, clear, and exact description.

The present invention relates to pistons for gas and other motors; and it consists of the details of construction hereinafter set forth, and particularly pointed out in the claims.

In order to render the present specification easily intelligible, reference is had to the accompanying drawings, in which similar letters of reference denote similar parts throughout both views.

Figure 1 is a longitudinal section through the center of the piston, and Fig. 2 a front elevation of the same.

In pistons for gas and petroleum motors the front part of the piston only has usually been employed to guide the same in the cylinder, the rear part being generally of a slightly smaller diameter and having the piston-rings. It has been found that the front part of the piston, which in pistons serving as cross-head at one and the same time serves to guide the whole piston in the cylinder, easily gets worn out, whereupon it becomes necessary to replace the whole piston with a new one. Then again the large area connecting the rearward and forward piston parts causes the distribution of very considerable heat from the rear to the fore part of the piston, thus considerably increasing the amount of friction generated in the straight guiding of the fore piston part.

The object of the present invention is to obviate these disadvantages in that the front part of the piston which serves to guide the same in the cylinder is made entirely separate from the rear portion which serves to carry the packing-rings and to close gas-tight against the walls of the cylinder.

According to the present invention the piston proper, *a*, is provided with the packing-rings *b*, while the front or guiding part *f* thereof is attached to the rear part by means of a short shaft *d*, which may be screwed into or otherwise attached to the piston proper, *a*. The part *f* is advantageously made of the two semicylindrical halves, as shown at Fig. 2, and contains the cross-head *c* therein, the said halves being advantageously attached to the cross-head by means of the screws *e e*.

The particular construction of the parts and the method of attaching them together is indifferent and may be carried out in any suitable manner.

I claim as my invention—

1. In combination, the cross-head, the semi-cylindrical removable and interchangeable guiding portions carried thereby, a short shaft integral with said cross-head extending axially rearward therefrom, a rear piston portion threaded on said shaft and packing-rings carried thereby, substantially as described.

2. In combination, a cross-head, a guiding and a packing cylinder, said guiding-cylinder consisting of a plurality of segmental sections removably secured to the cross-head and a connection between the packing-cylinder and the cross-head, substantially as described.

In witness whereof I have hereunto set my hand in presence of two witnesses.

HERMANN EDGAR EBBS.

FRANK D. HOWE, OF PORT WASHINGTON, NEW YORK.

ENGINE.

No. 906,589. Specification of Letters Patent. Patented Dec. 8, 1908.

Application filed June 22, 1908. Serial No. 439,662.

To all whom it may concern:

Be it known that I, FRANK D. HOWE, a citizen of the United States, residing in Port Washington, county of Nassau, and State of New York, have invented certain new and useful Improvements in Engines, of which the following is a specification, reference being had to the accompanying drawings, forming a part hereof.

It is desirable particularly in internal combustion engines, to reduce to a minimum the amount of lubricating oil which commonly works by the piston into the combustion chamber. If some means are not provided toward this end, the film of oil around the piston upon the walls of the cylinder gradually works inwardly into the combustion chamber where it becomes more or less carbonized and volatilized, to a considerable extent with the [illegible] of the engine.

A common way of lubricating the cylinder of an explosive engine, and particularly an upright explosive engine, is that known as the splash method, in which a quantity of lubricating oil is [illegible] the closed crank case of the engine, so that the crank, revolving therein, will splash the oil against the open end of the cylinder, thereby forming a film of oil on the interior surface of the same. It frequently happens, however, that this film of oil, which of course is constantly renewed by the splashing, is carried on past the piston and the oil caused to accumulate in the upper part of the cylinder, where it is decomposed or carbonized by the heat produced by the explosions, forming deposits and impairing the operation of the engine, chiefly by carbonizing the spacker or packing and thus interfering with ignition. It is necessary, of course, that a certain quantity of oil be spread over the cylinder surface, for lubrication, and hence it is only the excessive traveling or creeping of the oil that should be prevented.

The object of the present invention is to provide a very simple means for avoiding this objection above mentioned, which means shall not necessitate the addition of extra parts or involve any considerable expense in its embodiment or its service.

Broadly considered the invention consists in providing means upon the piston such as a sharp edge for scraping off the film of oil around the piston upon the walls of the cylinder as the piston moves forward, and a recess in the piston adjacent to said edge, whereby, as the film of oil is sheared off it will be deposited in the recess whence it may find its way back to the source of lubrication or elsewhere through a suitable relief.

The invention is illustrated in the drawings as embodied in an engine having a vertically working piston, and in said drawings, Figure 1 is a view in vertical central section of the engine showing the piston in side elevation, and, Figs. 2 and 3 are detail views in central vertical section through two pistons showing modifications.

The working cylinder, or more specifically, if the engine be of the internal combustion type, the combustion chamber is indicated by the letter 4 and the piston which, as shown, is of the ordinary trunk variety, by the letter 5. The piston may be provided with any suitable number of packing rings 6 which are sprung into peripheral grooves in the piston so as to bear resiliently against the walls of the cylinder, forming the working chamber. Just ahead of one of the rings, preferably the foremost ring as shown, I cause a groove 7 to be formed which may extend around the entire piston, and the edge of this ring, the edge toward the forward end of the piston, is made quite sharp, corresponding with the recess 7 is a relief chamber, which as shown in Fig. 1 is formed by the space formed between a groove 8 to which the piston may be provided and the bore 9 in the piston for such wrist pin. In Fig. 2 channels 7 are illustrated connecting the recess 7 with the interior of the piston to afford a relief for the recess. It will be obvious that a relief for the recess may be provided in various ways.

In operation, the forward movement of the piston, that is its movement away from or out of the cylinder, causes the sharp edge of the ring adjacent to the recess 7 to shear off the film of oil around the walls of the cylinder and to deposit such oil in the recess 7. Thence it finds its way back through the relief to the source of lubrication or to some other convenient depository. In practice, the lubrication of a vertical engine is often depended upon by the piston upon the walls of the cylinder. In such a case, the oil escaping through the relief can obviously be allowed to drip

back through the interior of the piston into the oil beneath.

It is obvious that the improvements may be embodied in other ways than those shown, described or referred to herein.

I claim as my invention:

1. In an engine, the combination with the engine cylinder, of a piston therein, a piston ring pressing against the walls of the cylinder, a recess to receive oil from the inner surface of the cylinder, and a relief for the recess.

2. In an engine, the combination of a working chamber, a piston therein having a peripheral recess, and a ring in the recess pressing against the walls of the chamber, said piston having a second recess arranged next to the ring so as to receive the oil scraped by the ring from the walls of the working chamber.

3. In an engine, the combination of a working chamber, a piston therein having a peripheral recess, a ring in the recess pressing against the walls of the chamber, said piston having a second recess adjacent to the ring, and a relief for said second recess.

4. In an engine, the combination of a working chamber, a piston therein having a peripheral recess, a ring in the recess having a sharp edge toward the forward end of the piston, said piston having a second recess adjacent to the ring, and a relief for said second recess into the interior of the piston.

5. In an engine, the combination of a working chamber, a hollow piston therein having a peripheral recess, and a ring in the recess having a sharp edge toward the forward end of the piston, said piston having a second recess extending around its periphery just ahead of the ring, and channels connecting said recess with the hollow of the piston.

6. In an engine, the combination with the engine cylinder, of a piston therein, a piston ring pressing against the walls of the cylinder, a recess next to the ring to receive oil from the inner surface of the cylinder, and a relief for the recess.

7. In an engine, the combination with the engine cylinder, of a piston therein, and a sharp edge extending around the periphery of the piston adapted to remove the oil from the inner surface of the cylinder as the piston moves in a direction away from the cylinder or out of the cylinder.

8. In a vertical engine, the combination with the cylinder, of a piston working therein, and provided with means for removing oil from the inner surface of the cylinder as the piston moves downwardly and discharging it from a point removed from said surface.

9. In an engine, the combination with the engine cylinder, of a piston therein having a wrist-pin, a piston ring pressing against the walls of the cylinder, a recess to receive oil from the inner surface of the cylinder, and a relief for the recess around the wrist-pin.

10. In an engine, the combination with the engine cylinder, of a piston therein, a piston ring, a recess into which the ring is adapted to scrape oil, and a relief for the recess

This specification signed and witnessed this 20th day of June, A. D., 1906.

UNITED STATES PATENT OFFICE.

EDMOND VAN BEVER, OF WATERTOWN, MASSACHUSETTS.

EXPANSIBLE PISTON.

1,031,212. Specification of Letters Patent. Patented July 2, 1912.

Application filed September 18, 1911. Serial No. 649,899.

To all whom it may concern:

Be it known that I, EDMOND VAN BEVER, a citizen of the United States, and resident of Watertown, county of Middlesex, Commonwealth of Massachusetts, have invented an Improvement in Expansible Pistons, of which the following description, in connection with the accompanying drawings, is a specification, like letters on the drawings representing like parts.

This invention relates to pistons and, while applicable to other and more general uses, is especially designed for use in gas engine construction.

As is well known, the ordinary engine piston or plunger, though it may have been originally formed to closely fit its cylinder, after a period of use wears down to a certain extent and this, along with the wear of the cylinder, makes the piston a loose fit in the cylinder so that it tends to have some small lateral chucking play therein, which is only imperfectly prevented by the packings. This looseness of the piston in its cylinder tends to the premature destruction of the packing rings, as well as requiring special attention to the fitting of these.

The present construction provides a piston formed so as to be expansible from within to take up for the small diminution in its diameter due to wear, so that, even after a considerable period of use, its peripheral dimension may be the same as at the beginning.

The invention will be better understood from the following detailed description taken in connection with the accompanying drawings and will thereafter be pointed out in the appended claims.

Referring to the drawings, Figure 1 is a central longitudinal section showing a piston wherein my invention is carried out, a portion of the cylinder being shown broken away. Fig. 2 is a transverse section taken at the right of Fig. 1, portions of the piston being shown in elevation. Fig. 3 is a detail section on line 3—3 of Fig. 2. Fig. 4 is a fragmentary sectional detail showing another form of expanding mechanism, and Fig. 5 is a section on line 5—5 of Fig. 4.

The piston 10, usually of cast iron, is shown as of the integral hollow shell type with its outer end closed and is fitted to the cylinder 11 and united to a connecting rod 12 by wrist pin 13 fitted to sockets in bosses 14 projecting inward from the hollow shell intermediate of its length. The hollow shell of the piston, as is usual, extends rearwardly for some distance from the wrist pin connection as seen at 15, this rearwardly extending portion being slightly tapered so as to terminate in a relatively thin inner extremity. In the practice of my invention this hollow shell, for a considerable distance from its inner end, is divided into a number of sections, shown as four, by lengthwise slits 16. These slits, which, in the illustrative embodiment shown, extend substantially to the wrist pin connection, though the exact length thereof is not material, may be readily formed by sawing the piston shell with an ordinary metal saw. These sectional portions have a certain amount of springing capacity which need only be very slight for the present purpose, and as a means for expanding them outward to the small extent necessary, I provide an expanding ring 17 fitted into the piston sleeve and held from casual displacement by means shown as a screw bolt 18 tapped in a hole partly in the ring and partly in the piston shell. The ring 17 is divided at the point 19 and the abutting ends at this point are adapted to be forced apart by a screw bolt 20 fitted to a hole formed in the abutting ends, this bolt having a conical head 21 and having fitted thereto a nut 22 with a conical head 23. Thus as the nut 22 is screwed up on the bolt 20, the conical portions 21, 23 force the abutting ring ends apart, causing expansion of the ring and corresponding expansion of the sectional portions of the piston shell. As a means for preventing casual displacement of the nut 22, it is formed with an abutment plate 24 flattened off, as seen at 25 in fig. 2, the inside of the piston shell. The screw bolt 20 is likewise prevented from casual displacement after adjustment by having a cotter pin 26 passed through a transverse aperture in its end and with its extremity in position to press against the inside of the piston shell, so that both the screw bolt and its nut are thus held against movement, and any desired expanding adjustment of the piston ends of the sections is reliably maintained.

The form of expanding mechanism just described is especially applicable for equipping worn pistons with my invention, since it does not require any machining of the piston. In the case of new pistons which can be conveniently machined the expand-

ing device of Fig. 4 and Fig. 5 may be advantageously employed. As shown in these figures, the inner end 15' of the piston, which is provided with slots 16 as before described, has an internal tapered thread formed therein as seen at 28, and engaging with this thread is a ring 17' having a correspondingly tapered and threaded outer periphery. This ring may be screwed into the piston end to expand the sectional portions thereof to the extent desired, and as a suitable means for preventing the working out of this ring, I provide radial holes 29 therethrough at intervals through one or more of which a cotter pin 30 is passed so that its head extends up into a slot 16 without reaching the periphery of the piston, while its inwardly projecting ends may be bent over the ring to prevent dislodgment. Thus the head of the cotter pin engaging with the walls of the slot 16 effectively prevents any turning of the ring and holds the parts in precise adjusted position. The resiliency effected by the slits 16 may be somewhat enhanced if desired by the drilling of holes 27 in the extremities of these slits, though this is not essential to the effective carrying out of the invention.

It will be understood that while a cast iron piston of usual form is shown for illustrative purposes in setting forth the principles of my invention, the invention is not limited to this one form of piston, but may be carried out with various different piston and plunger constructions. The invention is likewise adapted for use in the production of new pistons or for the refitting of old and worn plungers. In the case of a plunger worn by use, all that is necessary is to remove it, saw the slits 16 from its inner end, select an expanding ring of proper size, and fit it to the inside of the shell, this fitting being facilitated by the usual tapering form of the standard types of hollow shell piston from the wrist pin inward.

Having described my invention, what I claim as new and desire to secure by Letters Patent is:

1. A piston formed with a hollow shell integral with the main body thereof, there being slits lengthwise through the shell from its inner end, and means for expanding the sectional portions thus formed to take up for wear.

2. A piston formed with a hollow shell integral with the main body thereof, there being a plurality of equally spaced apart lengthwise slits through the inner end portion of the shell, and an internal expander for the sectional shell portions thus formed.

3. A piston, having an inwardly extending shell portion integral therewith with a plurality of equally spaced apart lengthwise extending slits therethrough, and an internal expander for springing out and holding in expanded adjustment the sectional shell portions thus formed.

4. A piston, having a wrist pin fitted to inwardly projecting bosses thereof, and a shell portion extending inwardly from said wrist pin integral with the body of the piston, said shell portion being sectioned by a plurality of equally spaced apart slits into segmental portions, and an internal expanding ring fitted to the interior of said sectional shell portions.

5. A hollow shell piston, having inwardly extending bosses with a wrist pin fitted therein, and a shell portion integral with the piston body extending inwardly from said wrist pin, said integral shell portion having a lengthwise extending slit therethrough, and an internal expander fitted to expand said inwardly extending shell portion.

6. A piston, comprising an integral hollow shell portion with a slot extending lengthwise therethrough for a part of its length, and means for expanding said shell portion to take up for wear.

7. An integral hollow shell piston, having slits lengthwise through the shell from its inner end, and means for expanding the sectional portions thus formed to take up wear, said means consisting in a tapered threaded ring fitted to a tapered threaded seat in the end of the piston.

8. An integral hollow shell piston, having slits lengthwise through the shell from its inner end, and means for expanding the sectional portions thus formed to take up wear, said means consisting in a tapered threaded ring fitted to a tapered threaded seat in the end of the piston, said ring having a radially extending hole therethrough with a pin passed through said hole and engaging with the walls of one of said slits.

In testimony whereof, I have signed my name to this specification, in the presence of two subscribing witnesses.

UNITED STATES PATENT OFFICE.

EDWARD O. SPILLMAN AND LOUIS P. MOORES, OF NORTH TONAWANDA, NEW YORK.

PISTON FOR EXPLOSION ENGINES OR MOTORS.

1,092,870. Specification of Letters Patent. Patented Apr. 14, 1914.

Application filed July 10, 1913. Serial No. 778,737.

To all whom it may concern:

Be it known that we, EDWARD O. SPILLMAN and LOUIS P. MOORES, citizens of the United States, residing at North Tonawanda, in the county of Niagara and State of New York, have invented new and useful Improvements in Pistons for Explosion Engines or Motors, of which the following is a specification.

This invention relates more particularly to the pistons of explosion engines or motors.

As ordinarily constructed, the head and the body of the piston are integral or continuous, and the head, which is subjected to the full heat of the gas, transmits the same to the body. The resulting expansion of the body causes the same to bind in the cylinder, scoring or grooving the latter in time, or if the piston-body is fitted loosely enough to avoid scoring, it rattles in the cylinder and fails to compress the explosive mixture to the proper degree, impairing the efficiency of the motor.

It is the object of our invention to so construct the piston that the conduction or transmission of heat from the head to the body or guide portion of the piston is reduced to a minimum. Expansion of the body is thus diminished practically to that of the cylinder and the body may be closely fitted therein, thereby obtaining the maximum efficiency of the motor, avoiding rattling of the piston, and at the same time preventing scoring of the cylinder.

In the accompanying drawings: Figure 1 is a sectional elevation of a motor provided with the improved piston. Figs. 2 and 3 are longitudinal sections of the piston on the correspondingly numbered lines in Fig. 4, the packing rings being omitted. Fig. 4 is a transverse section thereof on line 4—4, Fig. 2.

Similar characters of reference indicate corresponding parts throughout the several views.

1 indicates a motor cylinder of any ordinary construction, the cylinder forming no part of our invention.

2 indicates the body or guide-portion of the piston, and 3 the head or front portion thereof which is shown as having the customary annular grooves 4 for receiving the usual packing rings 5.

The wall of the head, instead of being integral or continuous with the wall of the body, is isolated or separated from it by a gap or space 6 of suitable width to avoid or minimize transmission of the heat from said head-section to said body or guide-section and thereby prevent objectionable expansion of the latter. This gap may be produced by a saw cut made after machining and before grinding the piston.

The head and guide sections of the transversely-divided piston are tied together by any suitable connection, that shown in the drawings consisting of a tubular longitudinal web 7 arranged within the hollow sections and cast in one piece therewith.

In the construction illustrated in the drawings, the web is separated from the surrounding walls of the head and guide sections by a comparatively wide space, and the upper end of this connecting web joins the back of the head section, while its lower end joins the guide-section near its lower end or at a point remote from the non-conducting gap 6, whereby the amount of heat transmitted through the web from the head to the guide-section is reduced to a negligible degree, not only on account of the remoteness of the lower end of the web from the gap, but because the web is constantly cooled by the large volume of oil in the crank case. To permit circulation of the lubricant through the web and also reduce the weight of the piston, the web may be provided in opposite sides with openings 8, but these openings are not essential and the web may be imperforate, if desired. Oil holes or channels 9 may also be extended through the guide-section above the lower end of the web, as shown.

10 indicates the usual connecting rod of the motor and 11 the wrist-pin journaled in suitable bearings 12, which in the preferred construction shown, are integral with the web 8, as seen in Fig. 2. Opposite and in line with these bearings the guide-section may be provided with openings 13 for lubricating purposes.

The guide-section 2 is of the proper diameter to closely fit the cylinder and obtain the maximum efficiency of the motor, while the head-section 3 is sufficiently smaller in diameter than the guide-section to remain out of contact with the cylinder-wall under the maximum expansion of the head-section; this close fit of the guide-section being permitted without danger of scoring the cylinder, by reason of the isolation of the wall

or skirt from the wall of the head-section, which prevents undue expansion of the guide-section, as hereinbefore described. The body-section is long or extensive relative to the head-section and acts as a guide or cross-head therefor which receives all the side thrust of the connecting rod and keeps the head-section out of contact with the cylinder-wall at all times, causing it to operate freely and noiselessly.

As shown, the guide-section is extended forwardly or upwardly beyond the wrist-pin and in practice preferably terminates about a sixteenth of an inch short of the inner end of the head-section to leave the isolating gap 6.

This improved construction combines the important advantages of maximum engine efficiency, smooth and noiseless action of the piston and non-scoring of the cylinder; and these are obtained by simple means which do not materially increase the cost of the piston.

Preferably the upper edge of the piston body is beveled or inclined toward the axis of the piston, as shown at 14, while the lower edge of the piston-head is beveled in the reverse direction, as shown at 15. By this construction, on the upward stroke of the piston the lower beveled edge 14 deflects or crowds the surplus oil back into the piston, while on its downward stroke, the upper beveled edge 15 performs the same function.

We claim as our invention:

1. A piston comprising a head-section, a guide-section having its peripheral wall isolated from the corresponding wall of the head-section by a non-conducting gap extending practically around the piston, the guide-section being relatively long to form a cross head, and means connecting said sections.

2. A piston comprising a head-section, a guide-section forming a cross head and having its wall isolated from the wall of the head-section by a narrow non-conducting gap, and means connecting said sections.

3. A piston comprising a head-section, a separate guide-section therefor, means connecting said sections, and a wrist-pin bearing, the wall of the guide-section extending forwardly beyond the wrist-pin bearing and terminating short of said head-section to leave a non-conducting gap between said sections.

4. A piston comprising a head-section, a guide-section having its wall isolated from the wall of the head-section by a narrow non-conducing gap, and a web arranged lengthwise within said guide and head-sections and connecting the same, said web being located at a distance from the walls of said sections.

5. A piston comprising a head-section, a relatively long guide-section having its wall isolated from the wall of the head-section by a non-conducting gap, and an internal web connecting said sections and joining the guide-section at a point remote from said gap.

6. A piston comprising a head-section, a guide-section isolated from the head-section by a non-conducting gap, said guide-section being provided in opposite sides with openings, an internal web connecting said head-section with the guide-section, and wrist-pin bearings mounted on said web in line with said openings and isolated from the wall of the guide-section and the edges of said openings.

7. A piston comprising a guide-section, a head-section isolated from the guide section by a non-conducting gap, and a tubular web arranged within said sections and connecting the same, the web being provided with one or more oil openings.

8. A piston comprising a guide-section, a head-section isolated from the guide-section by a non-conducting gap, and an internal tubular web connecting said sections and separated from the surrounding piston-wall, said wall being provided with oil holes.

9. A piston comprising a guide-section, a head-section separated therefrom by a gap, and means within the piston connecting said sections, that end of the guide-section forming the rear edge of said gap being provided with an oil deflecting face.

10. A piston comprising a guide-section, a head-section separated therefrom by a gap, and means within the piston connecting said sections, that end of the guide-section forming the rear edge of said gap being beveled to slope toward the axis of the piston.

11. A piston comprising a guide-section, a head-section separated therefrom by a gap, and means within the piston connecting said sections, the adjacent ends of the said sections being beveled inwardly in opposite directions.

UNITED STATES PATENT OFFICE.

GUSTAVE E. FRANQUIST, OF NEW BRUNSWICK, NEW JERSEY.

PISTON.

1,153,902. Specification of Letters Patent. Patented Sept. 21, 1915.

Application filed August 1, 1914. Serial No. 854,494.

To all whom it may concern:

Be it known that I, GUSTAVE E. FRANQUIST, a citizen of the United States, residing at New Brunswick, in the county of Middlesex and State of New Jersey, have invented certain new and useful Improvements in Pistons, of which the following is a full, clear, and exact description.

This invention relates to internal combustion engines and has for its primary object the provision of a piston which will eliminate the piston clatter at all speeds and temperatures of the motor.

With this object in view, the invention consists of a piston having a sleeve which is circumferentially compressible and is adapted to have a snug sliding fit in the cylinder when cold, so that upon an expansion of the piston the sleeve will automatically yield sufficiently to prevent the piston from sticking in the cylinder, and after the cylinder has also expanded will again automatically resume substantially its normal size and take up the free play between the cylinder and piston, which would otherwise occur.

The invention also consists of the constructions which will be hereafter described in detail and particularly pointed out in the appended claims.

In the accompanying drawings Figure 1 shows a central longitudinal section through a cylinder and a piston constructed in accordance with the principles of this invention; Fig. 2 is a central longitudinal section of the piston on the line 2—2 shown in Fig. 3; and Fig. 3 is a bottom plan.

Referring to the drawings, 1 designates broadly the cylinder and 1' the water jacket of an internal combustion engine, the particular construction of which forms no part of the present invention. The piston shown may be regarded as comprising two parts, a head 2 and a sleeve 3, the head extending rearwardly to the rear end of the rearmost piston ring, while the remaining portion of the piston constitutes the sleeve. The head of the piston is provided with circumferential grooves 4 in which the piston rings 5 are adapted to be loosely fitted. Extending inwardly from the inner peripheral surface of the sleeve at diametrically opposed points are the piston pin bosses 6. These bosses are provided with ribs 7 through which an oil groove or hole 8 is bored in order to supply the lubricating material to a crank pin 9, which is suitably fitted in journals provided in these bosses, and is held in place therein by set screws 10. The pin 9 carries a connecting rod 11, the construction thus far described being typical of the ordinary hollow "trunk" piston.

As is the usual practice, the circumferential surface of the head of the piston, or that portion which lies between the piston rings, is machined so as to fit very loosely within the cylinder to permit an expansion of the piston when heated, and is usually from .010 to .090 of an inch less in diameter than the diameter of the cylinder. The piston rings are also fitted in the grooves to allow them to have some lateral movement. The head of the piston does not therefore serve to prevent the piston from rattling within the cylinder. It is necessary then to depend upon the sleeve of the piston to prevent the rattling or clapping of the piston within the cylinder and heretofore it has been customary to allow .002 to .006 free play between the sleeve of the piston and the cylinder to take care of the expansion of the piston before the cylinder walls become heated and to prevent the piston from sticking. After the engine has been running for a comparatively long period the cylinder walls expand, since the water in the jacket becomes heated and the same necessity for compensating for the expansion of the piston does not arise. When the sleeve fits as loosely as this within the cylinder, the piston will set up a rattling and clapping in the cylinder while it remains comparatively cool, i. e., while the motor is picking up, and against, after the cylinder has expanded so that the noise resulting therefrom may be heard by the driver and occupants of the car, if the internal combustion engine is used on an automobile. In order to prevent this rattling, it is proposed to use a piston having a sleeve which is circumferentially compressible so that it may be fitted snugly to the cylinder when cold and will automatically take care of the expansion of the piston. One embodiment of such a construction is shown in the drawings and will now be described. Projecting inwardly from the inner surface of the sleeve are longitudinal ribs 12 which preferably extend the entire length of the sleeve substantially parallel to the axis of the piston to a point on a level with the middle of the rearmost piston ring. Longitudinal slots 13 are cut in the outer surface of the sleeve and extend into these ribs, form-

ing the longitudinal grooves in the same. These slots divide the sleeve of the piston into longitudinal sections 14—14 and 15—15, the sections 14—14 carrying the piston pin bosses 6.

Circumferential slots 17—17 are cut in the outer surface of the sleeve in the sections 15—15 respectively, which slots extend to and join the longitudinal slots of 13, separating the longitudinal sections 15 from the head of the piston. The sections 14—14 which carry the piston pin bosses remain integrally connected to the piston head 2 and are relieved from a point on a level with the rearmost piston ring to a point below the piston pin bosses, approximately .005 of an inch on the side, to insure that upon the expansion of the piston the portion of the sleeve which carries the bosses will be prevented from sticking to the cylinder walls and causing either the motor to stop, or the breakage of the parts. In machining a piston of this character, the sleeve is given a relatively snug sliding fit within the cylinder even when cold; or in other words, the piston may be so accurately fitted to the cylinder that even when the piston is cold and the motor is starting there will be no rattling or undesirable noises produced by the actuation of the piston as the motor picks up and the temperature of the piston rises. Due to high temperature of the explosive gases the piston will commence to expand and the cylinder walls will therefore exert a pressure on the same which must be relieved in order to prevent the piston from sticking. It is obvious, however, that as the piston expands the longitudinal sections 15—15 which are separated from the head of the piston and the other portions of the sleeve, by the slots 13 and 17, will move inwardly under the pressure which is exerted on these sections by the cylinder walls until the slots 13 and 17 are closed. However, these slots are made sufficiently large to insure that this will not occur. The rear ends of the sections 14—14 will yield similarly to sections 15—15. It is obvious, then, that the only portions of the sleeve which cannot yield due to the pressure exerted by the cylinder walls on the expanding piston, are those portions of the sleeve opposite the piston pin bosses, and, as has already been stated, these portions of the sleeve are relieved .005 of an inch or more on the side so that there will be no liability of these portions of the sleeve sticking to the cylinder walls. The circumference of the piston will therefore be decreased the desired degree and the piston will operate within the cylinder without sticking, while maintaining a snug sliding fit therein which will prevent any rattling. After the motor has been running a comparatively long period of time the water in the jacket becomes heated and the cylinder expands, but any free play which would otherwise occur will be taken up by the sections of the sleeve which have been compressed resuming their normal position. Another advantage of a sleeve of this character is that in a multi-cylinder engine it is customary to connect one or more of the cylinders together, which, when the cylinders expand, will cause a distortion of the cylinders from a true circle in cross section. By making the sleeve compressible in the manner described, any distortion of the cylinder will cause one or more sections of the piston to yield and the sticking of the piston which has heretofore taken place will be obviated.

While I have shown a particular embodiment of my invention for constructing a piston which is adapted to be compressed circumferentially under the pressure which is exerted by the cylinder walls upon the sleeve of an expanding piston, yet it is not my intention to be limited to the particular construction shown, as the invention is capable of various modifications and it is my intention to cover broadly a piston having a sleeve which is adapted to be compressed circumferentially by the pressure exerted by the cylinder walls when the piston is expanding so that the piston will at all speeds and temperatures of the motor, have a snug sliding fit within the cylinder, which will prevent any rattling of the piston.

What I claim as new and desire to secure by Letters Patent, is:

1. In combination with the cylinder of an internal combustion engine, a piston comprising a head and a sleeve, said sleeve being automatically circumferentially compressible under the pressure exerted by the cylinder walls upon said sleeve when said piston expands.

2. In combination with a cylinder for an internal combustion engine, a piston comprising a head and a sleeve integral therewith, said sleeve being automatically compressible under the pressure exerted by the cylinder wall upon said sleeve when said piston expands.

3. A piston for internal combustion engines, having a head and a sleeve integral therewith, said piston having a circumferential slot therein separating a portion of said sleeve from said head and longitudinal grooves in said piston joining said circumferential slot, forming a section of said sleeve capable of bodily movement relative to the remainder of said sleeve.

4. A piston for internal combustion engines, comprising a head and a sleeve integral therewith, said piston having a circumferential slot therein dividing a portion of said sleeve from said head, longitudinal ribs formed on the inner peripheral surface of said sleeve, said ribs having longitudinal

grooves therein, joining said circumferential slot.

5. A piston for internal combustion engines, comprising a head and a sleeve integral therewith, said piston having a circumferential slot therein on a level with the rearmost piston ring, and ribs on the interior surface of said sleeve extending from the bottom of said sleeve to said slot, said ribs having longitudinal grooves therein joining the ends of said circumferential slot.

6. A piston for internal combustion engines, having a head and a sleeve, said sleeve having a rib on its inner surface extending the entire length of said sleeve, said sleeve having a slot therein extending into said rib and forming a longitudinal groove therein.

7. In an internal combustion engine, a cylinder, a piston therein comprising a sleeve having a snug sliding fit in said cylinder at all temperatures of said piston.

8. In an internal combustion engine, a cylinder, a piston comprising a head and sleeve, said sleeve having the portions thereof whose peripheral surfaces are in sliding contact with the walls of said cylinder automatically circumferentially compressible under the pressure exerted by said cylinder walls upon said sleeve when said piston expands.

9. In an internal combustion engine, a cylinder, a piston comprising a head and a sleeve integral therewith, said sleeve having the portions thereof whose peripheral surfaces are in sliding contact with the walls of said cylinder automatically circumferentially compressible under the pressure exerted by the said cylinder walls upon said sleeve when said piston expands.

10. In an internal combustion engine, a cylinder, a piston comprising a head and a sleeve, piston pin bosses projecting from the interior of said sleeve at a point adjacent the head of the piston, said sleeve comprising longitudinal sections some of which are bodily movable inwardly under the pressure exerted by the walls of said cylinder upon the same as the piston expands, and others of which, which carry the piston bosses, having the portions thereof extending outwardly from the piston bosses toward the free end of the sleeve also bodily movable and having their surfaces opposite the piston bosses of reduced diameter so that these portions are not in sliding contact with the walls of the cylinder.

11. In an internal combustion engine, a cylinder, a piston therefor, a head and a sleeve integral therewith, piston pin bosses extending from the interior surface of said sleeve, said piston having a circumferential slot therein on a level with the rearmost piston rim, and ribs on the interior surface of said sleeve extending from the bottom of said sleeve to said slot, said rib having longitudinal grooves therein joining the ends of said circumferential slot, and the external surface of said sleeve being relieved opposite the piston pin bosses whereby said portions of the sleeve do not contact with the cylinder walls.

In witness whereof I subscribe my signature in the presence of two witnesses.

UNITED STATES PATENT OFFICE.

WALTER L. SCHOENGARTH, OF IRONWOOD, MICHIGAN.

ADJUSTABLE GAS-ENGINE PISTON.

1,174,092. Specification of Letters Patent. Patented Mar. 7, 1916.

Application filed October 1, 1915. Serial No. 53,533.

To all whom it may concern:

Be it known that I, WALTER L. SCHOENGARTH, a citizen of the United States, residing at Ironwood, in the county of Gogebic and State of Michigan, have invented certain new and useful Improvements in Adjustable Gas-Engine Pistons, of which the following is a specification.

My invention relates to an adjustable gas engine piston, the object being to prevent what is called a piston knock and flutter, and in my present invention provision is made for adjusting the size of the piston according to rule, so that it can be made to last the lifetime of the motor. The result is, it is quiet, and without knock or flutter, thus rendering re-boring and new pistons unnecessary, prolonging the life and usefulness of the motor, and greatly reducing the cost of repair, etc.

My improved piston can be ground according to the ideas of the repairman or builder, doing away with all rough surfaces, after which it may be adjusted to a perfect fit in the cylinder-bore.

With these objects in view, my present invention comprises a piston which is transversely and diagonally slotted on one side, with means inside for expanding the piston to fit perfectly the bore of the cylinder.

It further consists in bushings for the cross-head pin, which are capable of quick and accurate adjustment to take up wear.

In the accompanying drawings: Figure 1 is a view of the motor in vertical section, showing the position of piston; Fig. 2 is a side elevation of the piston; Fig. 3 is a sectional view on the line 3—3 of Fig. 2; Fig. 4 is an end view looking into the piston; and Fig. 5 is a view of the wrench for adjusting nuts.

A, represents the piston, it being provided with the circumferential ring grooves 1, 1, adapted to receive packing-rings, and ring pins 2 are provided in these grooves to prevent the rings from shifting. The piston has two slots, namely a transverse slot 3 cut nearly half-way through on one side, and at each end of which a small hole 3' is drilled, and a diagonal slot 4 extending from the point near the center of the transverse slot 3 to one end of the piston. This slot is cut diagonally for two purposes, first, to prevent wear, and second, for convenience in making the upper and lower piston adjustment. The piston adjustment is taken up in two places, namely at the upper end of the diagonal slot and also at the lower end. The adjustment is through the two screws or studs 5 and 5' which turn in threaded orifices in the lugs C and D located at the upper and lower ends respectively of the piston, the inner ends of these screws or studs turning in the holes in the abutments E and F respectively. Access is gained to these screws by a screw-driver inserted through the holes H and I respectively, and jam-nuts 6 on these screws or studs have notched edges to receive the wrench 18 by which they are turned up tight by the lock-washers 7 against the lugs C and D. To expand the piston to the size required, the nuts are loosened, and the screws are turned in the lugs to get the required expansion, after which the jam-nuts are tightened up against the lugs, and in this way the piston may be re-fitted to the bore of the cylinder at any time without the necessity of re-boring or the purchase and substitution of new pistons. In fact this adjustment may be accomplished without removing the piston from the cylinder.

The ends of the cross-head pin 19 are supported in cross-head bushings 8, 9. These are preferably made of bronze or brass, and split longitudinally, having an external taper so that they are compressible around the ends of the cross-head pins by means of the take-up bushing nuts 8 at either end, and a cotter-pin 10 is inserted to hold the bushing nut 8 against turning. It is evident that a plain bushing, such as shown in 11, might be used instead of a tapering, adjustable one as described. The bushing-seats 14 are preferably reinforced at top of piston, as shown in Fig. 3. The piston is placed in the motor, as shown in Fig. 1, that is to say with the solid side of the piston toward the expansion wall or the side of cylinder where the explosion or combustion takes place and forces the piston against the cylinder wall on the power stroke, thus bringing the slots 3 and 4 on the right side of the engine.

Obviously more or less slight changes might be made in the form and arrangement of the several parts described without departing from the spirit and scope of my invention, and hence I do not wish to limit myself to the exact construction herein set forth, but—

I claim:

1. An expansible piston having a diag-

verse and longitudinal slot therethrough, and adjustable locking means located internally for expanding the piston.

2. A piston transversely and longitudinally slotted, and screws supported on one side of the longitudinal slot and engaging a member on the opposite side thereof, whereby when turned in one direction the piston is expanded, and when turned in the opposite direction it contracts by its own elasticity.

3. A piston transversely and longitudinally slotted, and screws supported on one side of the longitudinal slot and engaging a member on the opposite side thereof, whereby when turned in one direction the piston is expanded, and when turned in the opposite direction it contracts by its own elasticity, and means for locking said adjusting means.

4. A piston transversely and longitudinally slotted, and having holes therethrough on one side of the longitudinal slot, lugs and abutments located on opposite sides of the longitudinal slots and having orifices therein in alinement with the holes in the pistons, and screws extending through said orifices in the lugs and abutments, accessible through holes in the piston, for adjusting the piston.

5. A piston transversely and longitudinally slotted, and having holes therethrough on one side of the longitudinal slot, lugs and abutments located on opposite sides of the longitudinal slots and having orifices therein in alinement with the holes in the pistons, screws extending through said orifices in the lugs and abutments, accessible through holes in the piston, for adjusting the piston, and lock-nuts located on the screws on opposite sides of the lugs for locking the screw against turning to hold the piston in its adjusted position.

6. The combination with a piston, of a cross-head pin, a tapering adjustable bushing, and a take-up bushing-nut for moving the bushing endwise and contracting it around the cross-head pin.

7. The combination with a piston, of a cross-head pin, a tapering adjustable bushing, and a take-up bushing-nut for moving the bushing endwise and contracting it around the cross-head pin, the bushing-nut externally screw-threaded to turn in a threaded orifice concentric with the outer end of the bushing, and means for locking the bushing-nut against turning.

In testimony whereof I affix my signature.

WALTER L. SCHOENGARTH.

CHARLES WHITE, OF BALTIMORE, MARYLAND.

PISTON AND PISTON-ROD CONNECTION.

1,195,936. Specification of Letters Patent. Patented Aug. 22, 1916.

Application filed August 7, 1915, Serial No. 44,908. Renewed July 20, 1916. Serial No. 110,252.

To all whom it may concern:

Be it known that I, CHARLES WHITE, a citizen of the United States, residing at Baltimore, Maryland, have invented certain new and useful Improvements in Piston and Piston-Rod Connections, of which the following is a specification.

The invention consists in the features and combination and arrangement of parts hereinafter described and particularly pointed out in the claims.

In the drawings; Figure 1 is a diagrammatic view of a cylinder and piston with the connecting rod and crank. Fig. 2 is a longitudinal sectional view of the piston with the connecting rod in place partly in section.

In these drawings I show diagrammatically a cylinder 3 with its piston 4. This piston is formed with a cylindrical head portion and a reduced lower portion consisting of transverse walls 5 connecting the segments or sides 6 which conform in curve to the wall of the cylinder. In these transverse walls 5 bearings are provided for a pin 8, said bearings being indicated at 7. The pin 8 has cylindrical ends adapted to turn in these bearings and a central portion 8' with flat sides. This central portion is engaged by the slotted or forked upper end 9 of the connecting rod 10 which at its other end is connected with the crank pin 11, the center of the crank being indicated at 12 in line with the axis of the cylinder and piston. The driving connection or wrist pin connection between the piston and the connecting rod is provided by a pin 13 carried by blocks 14 having curved upper and lower surfaces 15 and 16 conforming to the curved walls of guide-ways 17 formed in the side walls 5. These guide-ways are concentric with the center of the pin 8.

The connecting rod 10 has an enlarged portion at 18 through which the wrist pin 13 extends. There is one of the guide blocks 14 for each end of the wrist pin 13, the connecting rod engaging the central portion of said wrist pin as shown in Fig. 2, which also illustrates the fact that the connecting rod works between the side walls or walls 5. The power from the piston is transmitted to the connecting rod through the wrist pin 13 and conversely the pull of the connecting rod, for instance on the suction stroke is transmitted to the piston through the said wrist pin 13, this being in contra-distinction to the usual practice in which the power is transmitted through a pin located in the plane of the axial center of the piston and immovably fixed in relation to said axial plane, as would be the case were the connecting rod 10 pivoted to the piston only by the pin 8.

It will be observed from Fig. 1 that with the crank on its quarter stroke the connecting rod extends at an angle to the axis of the piston and that the wrist pin lies to one side of said axis and on the same side thereof upon which the crank pin is now located. As the crank turns and the connecting rod approaches the axial plane of the piston the wrist pin 13 shifts in the guide 17 and approaches the axial plane until when the parts are on dead centers, the wrist pin 13 will be lying directly in the axial plane of the piston and as the crank continues to move and the crank-pin departs from the dead center and moves toward its other quarter stroke position the wrist pin will continue shifting, being thus carried across the dead center and occupying positions to one side of the axial center of the piston corresponding to the angular position of the crank pin. In these movements of the connecting rod its upper end will pivot about the pin 8, it being understood that the sole function of this pin is to control this pivotal movement and insure the shifting of the wrist pin from side to side of the axial center of the piston as the crank continues its rotation and it will be understood further that the pin 8 does not perform any function of transmitting the power between the piston and the connecting rod but that this function is performed entirely by the shifting wrist pin.

The shifting wrist pin takes the full strain exerted upon the piston and none of this strain is taken by the centrally arranged pin 8 which merely acts as a guide or controller for the wrist pin to insure its shifting properly within the prescribed limits.

I do not limit myself to the particular form or detail of the connection herein described. Where, for instance, I refer to a pin and slot or fork connection at 8, I mean by this that the pin 8 is so coupled to the end of the piston rod that the power will not be transmitted through this pin.

It will be noticed that the piston is provided, in effect, with two tracks or ways 17 concentric with each other, and that the block 14 constitutes a sliding connection be-

tween the piston and piston rod movable along said tracks or ways as the rod assumes different angular positions.

By my improvement I get long wearing surfaces between the shifting block and the curved guides of the piston.

I claim:—

1. In combination with a piston and cylinder, a crank pin and connecting rod and a shifting wrist pin forming the connection between said connecting rod and piston, said wrist pin shifting from one side to the other of the axial line of the piston in accordance with the movement of the crank pin to one side or the other of said axial line, substantially as described.

2. In combination with a piston and cylinder, a crank with its pin and connecting rod, said connecting rod being controlled by a pivot on the piston, guide means on the piston and a wrist pin to transmit the power between the piston and the connecting rod, said wrist pin being guided by said guide means and shifting from side to side of the center line of the piston as the connecting rod assumes different angular positions in relation to said center line, substantially as described.

3. In combination with a piston and cylinder, a crank pin and connecting rod, a slot and pin connection between the connecting rod and piston to control the pivotal movement of said connecting rod and a wrist pin connection between said piston and connecting rod with a guide-way carried by the piston for the said wrist pin, substantially as described.

4. In combination with a piston and cylinder, a crank and connecting rod, a shifting wrist pin connection between the connecting rod and piston, said wrist pin moving from side to side of the axis of the piston to accord with the movement of the crank pin and controlling means to control the pivotal movement of the connecting rod in relation to the piston, substantially as described.

5. In combination with a piston and cylinder, a connecting rod and crank, controlling means consisting of a pin and slot or forked connection between the end of the connecting rod and the piston and a wrist pin connection intermediate the said pin and slot connection and the crank and a guide on the piston concentric with the pivot pin, said guide receiving the wrist pin to permit the same to shift from side to side of the center of the piston, substantially as described.

6. In combination a piston, a connecting rod, means for controlling the pivotal movement of the connecting rod in relation to the piston, guide means on the piston concentric with said controlling means, a block or blocks movable in the guide way or ways, a wrist pin connected with the connecting rod and carried by the said block or blocks, substantially as described.

7. In combination with a piston and cylinder, a crank pin and connecting rod, and a shifting connection between said connecting rod and piston, said connection shifting from one side to the other of the axial line of the piston in accordance with the movement of the crank pin to one side or the other of said axial line.

8. In combination with a cylinder, a piston, piston rod and crank pin, said piston having two curved tracks or ways concentric with each other, and a sliding connection between the piston and piston rod movable along said tracks or ways as the piston rod assumes different angular positions in relation to the piston.

In testimony whereof, I affix my signature in presence of two witnesses.

UNITED STATES PATENT OFFICE.

EDWARD O. SPILLMAN, OF NORTH TONAWANDA, NEW YORK.

PISTON FOR EXPLOSIVE-ENGINES.

1,229,540. Specification of Letters Patent. Patented June 12, 1917.

Application filed November 11, 1916. Serial No. 130,833.

To all whom it may concern:

Be it known that I, EDWARD O. SPILLMAN, a citizen of the United States, residing at North Tonawanda, in the county of Niagara and State of New York, have invented new and useful Improvements in Pistons for Explosive-Engines, of which the following is a specification.

This invention relates more particularly to the pistons of explosion engines or motors, and is in the nature of an improvement in the piston shown and described in Letters Patent of the United States No. 1,092,870, granted April 14, 1914, to Louis P. Mooers and myself.

The object of my invention is to so construct the piston that the conduction or transmission of heat from the head to the bearings of the wrist-pin is minimized to obviate binding or undue friction of the wrist-pin and obtain the maximum efficiency of the motor.

In the accompanying drawings: Figure 1 is a fragmentary sectional elevation of a motor equipped with my improved piston. Fig. 2 is an enlarged vertical longitudinal section of the piston taken through the axis of the wrist-pin bearings. Fig. 3 is a similar section on line 3—3, Fig. 2. Fig. 4 is a transverse section of the same on line 4—4, Fig. 2.

Similar characters of reference indicate corresponding parts throughout the several views.

1 indicates a motor-cylinder of any ordinary construction, the same forming no part of my invention.

2 indicates the body or guide portion of the improved piston, and 3 the head or top portion thereof which, as shown, is provided with the customary annular grooves 4 for receiving the packing rings 5.

As in the patent above referred to, the wall of the head is preferably isolated or separated from the wall of the guide portion of the piston by a gap or space 6 of suitable width to minimize the transmission of heat from said head section to said guide section and prevent binding of the latter in the cylinder, as more fully described in said patent. In the construction shown, the two sections of the divided piston are tied together by a tubular longitudinal web 7 arranged within the sections and cast in one piece therewith, but separated from the surrounding walls thereof by a comparatively wide space except at its lower end where it joins the wall of the guide-section 2.

8 indicates the usual connecting rod of the piston and 9 the wrist-pin carried by the same. This pin is journaled in suitable bearings 10, which are preferably integral with the guide section 2 of the piston, as clearly shown in Fig. 2. They extend inwardly from diametrically-opposite sides of the wall of the guide section and pass through openings 11, 11 arranged in the tubular web 7 and made of considerably larger diameter than the external diameter of the bearings to leave a non-conducting air-gap or space between the web and the bearings. This isolated construction of the bearings effectively prevents direct and excessive transmission of heat from the web to the bearings and the wrist-pin avoiding binding of the latter and reducing friction to a minimum. It is apparent that in order to reach the bearings, the heat from the hot piston-head 3 has to travel downwardly throughout the length of the web 7 to the point where it joins the lower portion of the guide section 2 and thence upwardly to the outer ends of the bearings. Owing to this long path of travel, the reduction of temperature at the bearings is sufficient to avoid undue or objectionable heating of them and the wrist pin, and inasmuch as the lower portion of the piston and the web are constantly cooled by the supply of oil in the crank case and from the cooled cylinder walls, the amount of heat transmitted from the piston-head to their bearings is practically reduced to a negligible degree, insuring a smooth and easy operation of the wrist pin as well as the piston.

To facilitate the circulation of the oil through the web, the latter may be provided in opposite sides with openings 12.

While affording the above advantage, the improvement does not increase the cost of the piston.

I claim as my invention:

1. A piston comprising a head-section, a guide-section forming a cross head, means connecting said sections and located at a distance from their walls, and a wrist-pin bearing supported on said cross head and isolated from said connecting means by a non-conducting gap.

2. A piston comprising a head-section, a guide-section forming a cross head and having its wall isolated from the wall of the

head-section by a non-conducting gap, a web arranged lengthwise within said sections and connecting the same, and a wrist-pin bearing supported on said cross head and isolated from said web by a non-conducting gap.

3. A piston comprising a head-section, a guide-section isolated from the head-section by a non-conducting gap, an internal web connecting said head-section with said guide-section, and wrist-pin bearings mounted on said guide-section, said web being provided in opposite sides with openings for the passage of said wrist-pin bearings which are larger in diameter than the bearings, to leave a non-conducting gap between said last-named parts.

4. A piston comprising a head-section, a guide-section isolated from the head-section by a non-conducting gap, a tubular web arranged lengthwise within said sections and connecting the same and provided within the guide-section with openings, and wrist-pin bearings mounted on said guide-section and extending inwardly through said openings, the bearings being isolated from the edges of said openings by non-conducting gaps.

UNITED STATES PATENT OFFICE. 1711

JESSE G. VINCENT, OF DETROIT, MICHIGAN, ASSIGNOR TO PACKARD MOTOR CAR COMPANY, OF DETROIT, MICHIGAN, A CORPORATION OF MICHIGAN.

PISTON.

1,279,184. Specification of Letters Patent. Patented Sept. 17, 1918.

Application filed October 23, 1913. Serial No. 796,647.

To all whom it may concern:

Be it known that I, JESSE G. VINCENT, a citizen of the United States, and resident of Detroit, Wayne county, State of Michigan, have invented certain new and useful Improvements in Pistons, of which the following is a specification.

This invention relates to pistons and particularly to pistons for hydrocarbon motors.

One of the essentials of a good hydrocarbon motor such as may be used for motor vehicles is that the fit between the piston and the cylinder wall shall be loose enough so that the piston will be free to operate when the motor is hot and yet shall be tight enough to minimize leakage and to prevent what is technically known as "piston slap," that is, the sudden movement of the piston from one side of the cylinder to the other, usually at or during the explosion stroke.

This desired fit is of course difficult to get, and because of the fact that the top of the piston is subject to greater heat than the bottom of it, the piston is often ground to a tapered form, that is, with a greater clearance at the top of the piston than at the bottom. Under these circumstances the heat will expand the upper part or head of the piston more rapidly than the lower part or skirt, and when the motor is hot the piston is substantially cylindrical in shape, thus making the clearance throughout the length of the piston about the same.

It will be seen, therefore, that it is desirable that the piston should be kept in fairly close contact with the wall of the cylinder throughout the length of the piston or so much of its length as is possible.

One of the objects of the present invention is to form a piston with a yieldingly expanded skirt portion.

Another object of the invention is to form a piston with a solid cylindrical head portion and a yieldingly expanded skirt portion.

Another object of the invention is to form a piston in which the skirt portion is capable of contracting under pressure.

Another object of the invention is to form a piston with a cylindrical head and with a skirt portion formed of a plurality of segmental parts.

Other objects of the invention will appear from the following description taken in connection with the drawings which form a part of this specification, and in which:—

Figure 1 is a longitudinal section through a piston made in accordance with this invention;

Fig. 2 is an elevation view of the piston shown in Fig. 1 with the parts separated somewhat and with some of them cut away;

Fig. 3 is a transverse section on the line 3—3 of Fig. 1 and;

Fig. 4 is a transverse section on the line 4—4 of Fig. 1;

Fig. 5 is a part elevation of another form of piston made in accordance with this invention;

Fig. 6 is a section on the line 6—6 of Fig. 5;

Fig. 7 is a view similar to Fig. 5 of another form of the invention; and

Fig. 8 is a section on the line 8—8 of Fig. 7.

Referring to the form of the invention shown in Figs. 1 to 4, the upper portion or head of the piston is indicated at 10 and it is shown as of cylindrical form and made in one piece. Suitable grooves 11 are cut in the circumferential part of this head portion to take the usual piston rings. The skirts of the piston are shown as in two semi-cylindrical parts 12 and 13 and these parts are adapted to be expanded against the cylinder wall by means of two expanding rings 14 and 15 at the upper and lower ends of the parts respectively, as shown in the drawings. The upper expanding ring 14 has a further function in that it joins the upper part of the piston to the lower or segmental parts. This is accomplished by fitting the ring 14 into two aligned annular grooves 16 and 17 in the skirt and head portions respectively of the piston.

The bosses 18 are shown as formed in the skirt portion of the piston for the reception of the piston pin 19 upon which is the connecting rod 20. A suitable screw 21 secures the piston pin in position.

In the form of the invention shown in Figs. 5 and 6, the head portion 10' of the piston is shorter and the two part skirt portion 12' and 13' is provided with the piston ring grooves 11 as shown in the drawings. In this form also the head and skirt portions of the piston are interlocked by means of annular flanges 22 and 23, the pi-

ton of course being assembled before it is placed in the cylinder. Expanding rings 14^a and 15^a are provided as in the previous form of the invention.

In the form shown in Figs. 7 and 8, the skirt portion of the piston is divided into four segments by means of sawing longitudinal grooves 24 therein. This leaves the skirt portion 12^b of the piston integral with the head portion 10^b and in the form of dependent segments, the lower parts of which segments may be expanded against the cylinder wall as by the expanding ring 15^b. In this form only one expanding ring is used, but two or more may be used as in the other form. The skirts of all of the pistons shown are provided with annular grooves 25 to facilitate lubrication of the piston.

It is understood that the invention is not limited to the exact details of construction shown in these various views, as it will be apparent that changes may be made and other forms employed without departing from the spirit or scope of the invention.

Having thus described my invention, what I claim and desire to secure by Letters Patent is:—

1. A piston having a yieldingly expanding skirt portion and piston pin lugs formed wholly in said skirt portion.

2. A piston comprising a head portion and segmental parts forming the skirt portion, and means for yieldingly pressing said segmental parts radially outward, the piston pin lugs of the piston being formed wholly in said skirt portion.

3. A piston comprising an integral cylindrical head portion, a pair of semi-cylindrical parts forming the skirt portion, and separately formed annular means for connecting said portions.

4. A piston comprising an integral cylindrical head portion, a pair of semi-cylindrical parts forming the skirt portion, and separately formed circumferential interlocking connecting means for said portions.

5. A piston comprising an integral cylindrical head portion, a pair of semi-cylindrical parts forming the skirt portion, separately formed interlocking connecting means for said portions, and means for yieldingly expanding said semi-cylindrical parts.

6. A piston comprising a cylindrical head portion adapted to contact with a cylinder wall, a pair of semi-cylindrical parts forming the skirt portion, and an interlocking connecting ring for said portions.

7. A piston comprising a head portion, a separately formed skirt portion, and an interlocking connecting ring for said portions.

8. A piston comprising a head portion, segmental parts forming the skirt portion, and means acting to connect said portions and to press said segmental parts radially outward.

9. A piston comprising a head portion, segmental parts forming the skirt portion, and means acting to connect said portions and to yieldingly press said segmental parts radially outward.

In testimony whereof I affix my signature in the presence of two witnesses.

UNITED STATES PATENT OFFICE. 1715

CHARLES C. ANDERSON, OF CEDAR RAPIDS, IOWA.

LIGHT-WEIGHT PISTON.

1,283,021. Specification of Letters Patent. Patented Oct. 29, 1918.

Application filed October 9, 1917. Serial No. 195,889.

To all whom it may concern:

Be it known that I, CHARLES C. ANDERSON, a citizen of the United States, residing at Cedar Rapids, in the county of Linn and State of Iowa, have invented certain new and useful Improvements in Light-Weight Pistons; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

This invention is in the nature of a light weight gray iron piston and cross head combined, for explosive engines and it has for its primary object to provide a combined device of the character described of improved design and make up, braced in every direction in the web, whereby, although much lighter than devices of similar character now in use, will withstand the heavy blows occasioned by the explosions in the cylinder.

The exceedingly great advantages which attend the use of light weight pistons have long been appreciated but all such light weight pistons of which I have knowledge are made of material other than gray iron of which I make my invention, being exclusively made of an aluminum mixture or alloy of some kind, or of steel or some other lighter material. None of these, so far as I have been able to learn, have given the service desired, and for the one great reason that the material is lacking in the properties which will withstand the extreme heat and at the same time does not possess durable qualities.

In developing this invention my efforts have been directed toward making an engine piston which will stand the heat and strains with the piston now in use, but with a greatly reduced weight. My present piston shows a reduction of 40% or 1¼ pounds which, in the lifting process going on continually in the operation where four pistons in a motor make 1800 revolutions per minute, results in the saving of 8100 pounds per minute.

The results of this are relieving the wear on the bearings in the crank-shaft; counteracting the vibratory effect on the motor, reducing the necessary amount of gas required, and at the same time bringing into the construction a material which has been tried out and found to be reliable beyond a doubt.

With the specified purposes in view, the invention consists in the improved material, and the combination, arrangement and construction of the parts hereinafter fully described and afterward specifically claimed.

In order that the construction and operation thereof may be readily comprehended, I have illustrated an approved embodiment of my invention in the accompanying drawing and will now proceed to fully describe the same with reference to said drawing, in which—

Figure 1 represents a sectional view of my invention on a plane cutting longitudinally and centrally through the device as illustrated in Fig. 2.

Fig. 2, a sectional view on the plane indicated by the dotted line 2—2 in Fig. 1, and

Fig. 3, an end view.

Like reference characters mark the same parts in all of the figures of the drawing.

Referring particularly to the drawing, 5 indicates the head of the piston from which extends, at its circumference, the skirt 6 and in order to shorten the skirt and assist in reducing the weight of the piston, I make it only wide enough to provide for one circumferential groove 7, and I prefer to use, as the only ring, a three-piece ring for which I have applied for Letters Patent.

From opposite sides of the skirt 6 extend bearing pieces or slides 8 curved on the same arc as the skirt but each extending only substantially one fifth of the circumference thereof, thereby further reducing the weight of the piston, and these slides are connected near their edges, by longitudinally flattened transverse webs 9, 9, which are formed with and support the sleeves 10, 10, which receive the pins of the cross-head, (not shown).

To further support the cross-head bearing sleeves, webs 11, 11, extending from the webs 9, 9, in the same plane therewith, connect the webs 9, 9, and the sleeves 10, 10, with the inner face of the head 1 of the piston and with the inside of the skirt, while an additional web 12, at right angles to webs 11, 11, connects these webs together and their inner faces with the sleeve 10, 10 and with the inner face of the head 5.

Other webs 13, 13, in the same plane as the web 12, but on the opposite sides of the webs 9, connect the outer sides of the webs 9, 9, and the sleeves 10, 10, with the inner face of the head 5 and the inner face of the skirt 6.

All of the webs are of skeleton form and

while they rigidly and strongly connect the head, the skirt, and the cross-head bearing sleeves, and are integral therewith, they are of very light weight and serve to very largely decrease the weight of the piston while giving it sufficient strength to resist all of the strains to which such pistons are subjected as well as pistons now in use and of very much greater weight.

As before stated, my piston is made of gray iron, in a single integral skeleton structure, and by virtue of its well known strength and lightness, as well as of the peculiar construction described, it will operate equally as well as the very much heavier pistons, while saving very largely in power required, and also equally as well as the light weight pistons of aluminum mixtures or alloys, which do not possess the durability of my piston, are entirely lacking in expansive qualities, and will not stand the heat in the cylinders.

Having thus fully described my invention, what I claim as new and desire to secure by Letters Patent of the United States is:

1. A piston of gray iron consisting of a single, integral skeleton structure, comprising a head, a skirt of sufficient width to receive one ring only, bearing pieces for operating against the cylinder extending from opposite sides of the skirt, and sleeve bearings for the cross head pins supported from said bearing pieces.

2. A piston of gray iron consisting of a single, integral skeleton structure, comprising a head, a skirt of sufficient width to receive one ring only, bearing pieces for operating against the cylinder extending from opposite sides of the skirt, and sleeve bearings for the cross head pins supported from said bearing pieces, by means of skeleton webs extending from and connecting the opposite edges of the bearing pieces, the cross head sleeves being formed centrally of said webs and in line with each other.

3. A piston of gray iron consisting of a single, integral skeleton structure, comprising a head, a skirt of sufficient width to receive one ring only, bearing pieces for operating against the cylinder extending from opposite sides of the skirt, and sleeve bearings for the cross head pins supported from said bearing pieces, by means of skeleton webs extending from and connecting the opposite edges of the bearing pieces, the cross head sleeves being formed centrally of said webs and in line with each other, and additional supports for the sleeve bearings comprising a skeleton web at right angles to and connecting the first named webs with the sleeves and with the inner face of the head.

4. A piston of gray iron consisting of a single, integral skeleton structure, comprising a head, a skirt of sufficient width to receive one ring only, bearing pieces for operating against the cylinder extending from opposite sides of the skirt, and sleeve bearings for the cross head pins supported from said bearing pieces, by means of skeleton webs extending from and connecting the opposite edges of the bearing pieces, the cross head sleeves being formed centrally of said webs and in line with each other, and additional supports for the sleeve bearings comprising a skeleton web at right angles to and connecting the first named webs with the sleeves and with the inner face of the head, and two webs in the plane of the last named web connecting the outer faces of the first named webs with the sleeve and with the inner faces of the head and skirt.

5. A skeleton structure of gray iron forming a piston comprising a head, a skirt, slide bearings for the cylinder, extending from the skirt, sleeve bearings for the cross head pins, and webs connecting the cylinder slide bearings, the cross head bearing sleeves, the inner surface of the head and the inner surface of the skirt.

In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

CHARLES C. ANDERSON.

UNITED STATES PATENT OFFICE.

HARRY RALPH RICARDO, OF LONDON, ENGLAND.

PISTON FOR INTERNAL-COMBUSTION ENGINES.

1,294,833. Specification of Letters Patent. Patented Feb. 18, 1919.

Application filed April 22, 1918. Serial No. 229,555.

To all whom it may concern:

Be it known that I, HARRY RALPH RICARDO, a subject of the King of England, residing at London, in England, have invented certain new and useful Improvements in Pistons for Internal-Combustion Engines, of which the following is a specification.

This invention relates to pistons for internal combustion engines and has for its object to effect certain improvements in a known type of piston in which the piston head performs solely piston functions while the guiding is performed by members disposed on either side of the gudgeon pin, these guide members being extensions from the piston head flange.

In the design of piston for internal combustion engines, more especially pistons which are constructed of aluminium or aluminium alloy one of the difficulties which arises is due to the large clearance that must be allowed between the piston and the cylinder walls in order to permit of expansion. In an aluminium piston of normal design if sufficient provision is made to allow for expansion when the piston attains its highest temperature the clearance when the parts are cold is then so great that considerable noise is caused as the annular thrust of the connecting rod is reversed on passing the dead centers and consequently the piston is thrust from one side of the cylinder to the other, causing noise. By means of the present improvements this noise is reduced, as the piston is so designed that a large working clearance is not required.

According to this invention the piston comprises a flanged head of such diameter that it is a loose fit within the cylinder, with the wall of which it does not come in contact, the flange being provided with grooves in which are piston rings, and a guide portion which is a sliding fit in the cylinder and comprises two curved members or slippers between which lies the gudgeon pin. This guide portion is adapted to take the whole of the side thrust from the connecting rod and each of the curved members is separated by a continuous gap from the adjacent edge of the piston head flange. Webs carry the gudgeon pin and constitute the only connection between the curved guide members and the face of the piston head disk, with all of which parts the webs are integral. The arrangement of the webs is such that heat will be so conveyed from the piston head to the slippers as to be distributed equally over the whole surfaces of the slippers. The webs comprise two main members which may or may not be arranged parallel and are integral with and spring from the face of the piston head disk, each main portion of these webs being formed with a boss adapted to carry the gudgeon pin. The two curved guide members or slippers are oppositely disposed so as to inclose the gudgeon pin bosses, these slippers being as mentioned connected to and formed integral with the webs and through the latter connected to the piston head and gudgeon pin bosses.

The accompanying drawings illustrate by way of example one construction of piston in accordance with the present invention. In these drawings,

Figure 1 is a side elevation of the improved piston.

Fig. 2 is a sectional elevation on the line 2—2 of Fig. 1.

Fig. 3 is a transverse section on the line 3—3 of Fig. 2 looking in the direction of the arrows.

Like letters indicate like parts throughout the drawings.

The head of the piston comprises a disk portion A which is conveniently dished as shown in Fig. 2, and a flange A', the diameter of which is such in relation to the internal diameter of the cylinder that a large clearance is provided and the piston head will not come at all in contact with the cylinder walls. In the flange A' are grooves A^2 in which are carried piston rings B. Two main webs C spring from the piston head A across which they extend and with which they are formed integral. These webs C are parallel to each other in the construction shown in the drawings and project to a convenient distance from the head of the piston head. In each web C is formed a boss C' adapted to carry the gudgeon pin D which may be of suitable construction and either adapted to float in the bosses C' or be fixed therein as found desirable. On either side of the gudgeon pin bosses C' the webs C extend laterally and unite with two curved guide or slipper members E which are integral with the webs so that the latter constitute the connection between the slipper members and the piston head A. It is desirable to provide also a small central

transverse web C^2 which springs from the face of the piston head A and lies between and conflects with the parallel webs C. Small supplementary webs C^3 are also conveniently provided across the inner side of the guide slippers E and between the webs C with each of which parts these supplementary webs C^3 are integral.

As will be clearly seen in Figs. 1 and 2, the upper edge E' of each curved guide member E is separated by an unbroken continuous gap F from the adjacent opposed edge A^2 of the piston head flange A'. Thus while the guide members E are rigidly connected to the piston head A they are not in contact with the piston head flange.

Holes are preferably made through the slippers E as shown in Figs. 1 and 2.

The two webs C serve to distribute both the pressure and the heat delivered to the crown of the piston. The whole of the thrust and such heat as thus passes through the webs C are transmitted to the guide members E and distributed equally over them owing to the manner in which the guide members are joined to the webs C. By reason of the guide members E being separated at their edges from the piston head, heat can only pass from the latter to the guide members through the webs C and then only in such a manner as to effect satisfactory and equal distribution of the heat over the guide surfaces. Moreover the total amount of heat delivered to the bearing surfaces of the guide members is reduced and these surfaces can be freely lubricated. As a result of the reduced heat flow to the crosshead portion of the piston, which is composed of the guide members E and more especially as a result of the even distribution of heat over all the guide surfaces it becomes possible to provide a less clearance for expansion. In the case of a normal construction of piston the heat is transmitted from the piston head along the trunk and consequently the heat which flows through the upper part of the trunk immediately beyond the piston rings is excessive while toward the lower or outer end of the trunk the heat is relatively slight.

Though the present invention is more especially intended to be employed in the construction of a piston formed of aluminium or aluminium alloy, it is to be understood that it is equally applicable to a piston formed of cast iron, the details of construction being modified or not as found necessary.

The shape and dimensions of the slipper members may be varied as also the other details of the construction such as the width of the gap between the slipper members and the piston head flange and the shape and disposition of the webs. Thus for example the bearing surface of one slipper member may have a greater area than the bearing surface of the other slipper member, the two slipper members then being conveniently of different widths when measured in the circumferential direction. In such a construction instead of the webs C being parallel to each other these webs may be inclined and extend between the lateral edges of one slipper member and the corresponding lateral edges of the other slipper member.

What I claim as my invention and desire to secure by Letters Patent is:—

1. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having an integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap extending in the circumferential direction, two webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head disk and the guide members, and gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members as set forth.

2. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having a relatively short integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved relatively long members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap of small width extending in the circumferential direction, two webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head disk and the guide members, and gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members as set forth.

3. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having an integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being

rated from the head flange by a continuous gap extending in the circumferential direction and the diameter of the guide thus formed by these two curved members being slightly greater than the diameter of the piston head, two webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head disk and the guide members, and gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members as set forth.

4. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having a relatively short integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved relatively long members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap of small width extending in the circumferential direction and the diameter of the guide thus formed by these two curved members being slightly greater than the diameter of the piston head, two webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head disk and the guide members, and gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members as set forth.

5. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having an integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap extending in the circumferential direction, two webs which are integral with and spring from the head disk and are connected to and integral with the lateral portions of the guide members and constitute the only connection between the face of the head disk and the guide members, and gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members as set forth.

6. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having a relatively short integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved relatively long members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap of small width extending in the circumferential direction, two webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head and the guide members, gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members, and a web formed integral with the piston head disk and extending transversely across this disk between the two main webs as set forth.

7. In a position for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having an integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap extending in the circumferential direction, two parallel webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head disk and the guide members, and gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members as set forth.

8. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having a relatively short integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved relatively long members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap of small width extending in the circumferential direction and the diameter of the guide thus formed by these two curved members being slightly greater than the diameter of the piston head, two webs which are integral with and spring from the head disk and are connected to and integral with the lateral portions of the guide members and constitute the only connection between the face of the head disk and the guide members, gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members, and a web formed integral with the piston head disk and extending transversely

across this disk between the two main webs as set forth.

9. In a piston for an internal combustion engine the combination of a piston head adapted to perform solely piston functions and comprising a disk having a relatively short integral peripheral flange in which are annular grooves, piston rings in these grooves, two curved and similar relatively long members oppositely disposed with relation to the axis of the piston and together adapted to perform solely guiding functions, each curved member being separated from the head flange by a continuous gap of small width extending in the circumferential direction and the diameter of the guide thus formed by these two curved members being slightly greater than the diameter of the piston head, two parallel webs which are integral with and spring from the head disk and are connected to and integral with the guide members and constitute the only connection between the face of the piston head disk and the guide members, gudgeon pin bosses formed in these webs in which they are so positioned as to lie between the guide members, and a web formed integral with the piston head disk and extending transversely across this disk between the two main webs as set forth.

In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

UNITED STATES PATENT OFFICE. 1725

ALBERT SPILLMAN, OF NORTH TONAWANDA, NEW YORK.

ENGINE-PISTON.

1,325,176. Specification of Letters Patent. Patented Dec. 16, 1919.

Application filed February 13, 1919. Serial No. 276,466.

To all whom it may concern:

Be it known that I, ALBERT SPILLMAN, a citizen of the United States, residing at North Tonawanda, in the county of Niagara and State of New York, have invented new and useful Improvements in Engine-Pistons, of which the following is a specification.

This invention relates generally to engine-pistons, but more particularly to the type of pistons used in internal combustion engines or motors and having a skirt or tubular portion extending rearwardly from the piston-head.

The object of my invention is the production of an inexpensive self-adjusting and non-rattling piston of this kind which may be snugly fitted in the cylinder without danger of scoring it, and which bears uniformly against the cylinder wall around the entire circumference of the piston skirt and practically throughout its length.

In the accompanying drawings:

Figure 1 is a fragmentary longitudinal section of an internal combustion engine containing the improved piston. Fig. 2 is a transverse section on line 2—2, Fig. 1. Fig. 3 is a fragmentary longitudinal section on line 3—3, Fig. 1. Fig. 4 is a reduced side elevation of the piston, at right angles to Fig. 1. Fig. 5 is a horizontal section on line 5—5, Fig. 4.

Similar characters of reference indicate corresponding parts throughout the several views.

10 indicates the engine cylinder which may be of any approved construction, and 11 indicates the solid piston head having the customary annular grooves 12 for receiving the packing rings 13.

Extending rearwardly from the piston head is the skirt or tubular body 14 which contains the customary holes or bearings 15 for the piston pin to which the rod 16 is connected. In order to give the skirt the necessary resilience or contractile capacity to prevent scoring of the cylinder, it is provided at opposite sides with transverse or substantially horizontal slits 17 located near the upper end of the skirt, and spiral or diagonal slits 18 extending from one end of the horizontal slits to the rear edge of the skirt, the spiral slits trending in opposite directions, as best shown in Fig. 1. As seen in Fig. 4, the lower or rear ends of the spiral slits preferably terminate at points in line with the centers of the respective piston-pin holes, or substantially so, while the horizontal slits are formed principally in those sides of the skirt at right angles to the sides which contain the holes 15. These horizontal and spiral slits divide the skirt into a number of resilient tongues or sections of approximately triangular form which taper in opposite directions on the same side of the skirt, the small or pointed end of each tongue lying beside the wide end of the adjacent tongue, as shown in Fig. 1.

The grooved head of the piston is slightly smaller in diameter than the skirt, as usual, and to obtain the best results the narrow portion 140 of the skirt above its horizontal slits 17 is preferably reduced to the same diameter as said grooved head. In the drawings, this difference in diameter is exaggerated; in practice it usually does not exceed eight-thousandths of an inch in a three-inch piston.

By this construction, the skirt is rendered resilient around its entire circumference and practically throughout its length. It may therefore be snugly fitted in the cylinder without liability of scoring it, thus obtaining the maximum efficiency of the motor. With this improvement, even after the skirt of a three-inch piston wears about four-thousandths of an inch, it will still fit the cylinder closely enough to avoid knocking or rattling.

The engine will also continue in reliable operation for a comparatively long time, inasmuch as little or no oil can work past the piston into the top of the cylinder, thereby preventing burning of the oil by the spark and the formation of carbon and avoiding the coating of the spark-plugs and the production of a smoking exhaust.

If the slitted portion of the skirt be made, say two thousandths of an inch larger in diameter than the cylinder bore, it will act practically as a wide piston-ring or packing, the sections resulting from the slitting of the skirt being wholly disconnected from each other and unrestrained both in their expanding and contracting movements. The skirt is therefore self-adjusting and free to compensate for variations of diameter due to wear or changes of temperature of the piston and the cylinder, thus maintaining a close, non-rattling fit of the piston in the cylinder without causing sticking of the piston or scoring of the cylinder.

This construction and the resulting ad-

vantages render the use of aluminum practicable for such pistons, thus securing the additional advantage of lightness.

In the manufacture of the piston, after it has been slitted, the pointed ends of its resilient tongues or sections tend to spring out beyond the true cylindrical line of the piston. To avoid this, they are held in proper position by spot-welding or other suitable means and the surface of the piston is then ground to a true cylinder. The spot-welds are then removed, or if desired, they may be left in place until the piston is shipped to destination, when they are removed by the user.

I claim as my invention:

1. An engine piston having a head and a resilient automatically-expansible skirt extending rearwardly from the head, said skirt being tubular and provided at opposite sides near said head with transverse slits, and spiral slits extending from said transverse slits to the rear edge of the skirt, the two oppositely-tapering sections formed by said slits on the same side of the skirt being completely disconnected from each other and capable of springing inwardly and outwardly without restraint except by the inclosing cylinder-wall when the piston is in the cylinder.

2. An engine piston having a head and a resilient automatically-expansible skirt extending rearwardly from the head, said skirt being tubular and provided at opposite sides near said head with transverse slits, and spiral slits each extending from one end of the companion transverse slit to the rear edge of the skirt, the two oppositely-tapering sections formed by said slits on the same side of the skirt being completely disconnected from each other and unrestrained in their contracting and expanding movements, except by the inclosing cylinder-wall, when the piston is in the cylinder.

3. An engine piston having a head and a resilient automatically-expansible skirt extending rearwardly from the head, said skirt being tubular and having piston-pin holes at opposite sides, transverse slits formed in the sides of the skirt substantially at right angles to those containing said holes, and spiral slits each extending from a point in the rear edge of the skirt substantially in line with one of said holes, to the farther end of one of said transverse slits, the pair of oppositely-tapering sections formed by said slits on the same side of the piston being wholly disconnected from each other and the front section of the pair being likewise disconnected from said head throughout the length of the corresponding transverse slit, said several sections being free to spring inwardly and outwardly without restraint except by the inclosing cylinder-wall when the piston is in the cylinder.

4. An engine piston having a head and a resilient tubular skirt provided at opposite sides with piston-pin holes, each of the two remaining sides of the skirt comprising resilient automatically-expansible tongues arranged circumferentially of the skirt and extending from a point near said head to the rear edge of the skirt, adjacent tongues extending in opposite directions from their fixed ends toward their free ends and being disconnected from each other and unrestrained in their contracting and expanding movements, except by the inclosing cylinder-wall when the piston is in the cylinder.

5. An engine piston having a head and a tubular skirt extending rearwardly therefrom, said skirt comprising automatically-expansible spring-tongues extending in a circumferential series around the skirt, said tongues being integral with said head, adjacent tongues extending in opposite directions from their fixed ends toward their free ends, and the several tongues being disconnected from each other at their adjacent sides from a point near said head to the rear edge of the skirt and unrestrained in their contracting and expanding movements except by the inclosing cylinder-wall when the piston is in the cylinder.

UNITED STATES PATENT OFFICE.

ELMER C. LONG, OF QUINCY, ILLINOIS.

PISTON.

1,395,441. Specification of Letters Patent. Patented Nov. 1, 1921.

Application filed December 9, 1918. Serial No. 265,947.

To all whom it may concern:

Be it known that I, ELMER C. LONG, a citizen of the United States of America, and a resident of Quincy, in the county of Adams and State of Illinois, have invented certain new and useful Improvements in Pistons, of which the following is a specification.

This invention relates to improvements in pistons.

One of the objects of this invention is to provide an improvement in a piston which is more especially used in internal combustion motors in which means are provided in the piston whereby a better fitting relation is provided thereto relative to the cylinder in which the piston is adapted to reciprocate.

Another object of the invention is to provide an improved piston in which the lower and intermediate portions thereof are capable of expanding and contracting more readily than heretofore relative to the heat contained in the cylinder.

A further object of the invention is to provide an improved piston in which the back-slap or connecting rod thrust will be eliminated.

Other and further objects will appear in the specification and be specifically pointed out in the appended claims, reference being had to the accompanying drawings, in which,

Figure 1 is a side elevation of this improved piston.

Fig. 2 is a side elevation opposite to that shown in Fig. 1.

Fig. 3 is a vertical section taken on the line III—III of Fig. 1.

Fig. 4 is a horizontal section taken on the line IV—IV of Fig. 2.

Fig. 5 is a horizontal section on a reduced scale taken on the line V—V of Fig. 2.

Referring to the drawings the solid end 1 of the piston has the usual piston ring grooves 2 formed therein. In order to more fully describe this improved invention that portion of the piston shown in Fig. 1 will be hereinafter designated the A-side portion, whereas that portion in Fig. 2 will be hereinafter designated as the B-side portion.

Formed in the side portion A is a cut-out tongue shaped portion 3, said tongue portion being formed by a pair of vertically cut slots 4 and a horizontally cut slot 5 adjoining the upper ends of said slots 4, the lower ends of the slots 4 terminating as shown at 6 a distance above the lower end 7 of the piston. Leading from the lower end of the piston in the side portion A is a vertically formed slot 8 which extends upwardly intermediate of the tongue portion 3 and terminates at a point about midway of the length of said tongue portion.

Centrally arranged in the side portion B of the piston is a vertically formed slot 9 which extends from the lower end of the piston 7 and terminates a short distance below the lower piston ring recesses 2, and there being a pair of horizontally formed slots 9ª leading from the vertically formed slot 9, said slots 9 and 9ª forming a T-shape. This slot 9 is diametrically opposite from the slot 8. The slots 8 and 9 are also arranged at right angles to the wrist pin openings 10.

Heretofore in the manufacture and use of pistons for internal combustion motors, due to their having a solid peripheral cylinder bearing surface, the diameters of said pistons have to be turned off to diameters that are much less than the diameters of the cylinders in which they are to reciprocate, on account of the fact that extreme expansion of the piston has to be taken care of in order to prevent too much friction which is caused by too tight a fit of the piston in the cylinder. With this improved piston in which the tongue portion 3 is formed and in which the vertically formed slots 8 and 9 are contained, a closer fit may be established between the piston and its cylinder during the assembly. Then when a motor equipped with these improved pistons is in operation upon the greatest expansion of the piston, the expanding forces against the peripheral surfaces of the pistons will engage the cylinder wall with a pressure only great enough to automatically accommodate a proper sliding relation of the piston relative to the cylinder, whereas the excess expanding or expansion will be carried out in the slots 4, 8 and 9 of the piston, thereby preventing undue frictional wearing of the piston against the cylinder.

The construction of the tongue shaped portion 3 is formed in the intermediate portion of the piston for the purpose of taking care of the expansion and contraction of said intermediate portion, said tongue shaped portion, however, also being assisted by the slot 9, wherein the slot 9 and lower

end of the slot 9 will provide for the expansion and contraction of the lower end of the piston.

In a piston of this improved character it is preferable to have the solid end 1 of the piston of a lesser diameter across the peripheral surface adjacent the piston ring recesses 2 than the remaining lower portion of the piston, said lesser diameter adjacent the solid end of the piston not being considered relative to this improved invention, as the usual type of piston rings mounted in the recesses will automatically take care of the proper expanding, contracting and packing relation relative to said solid piston end.

The slots 8 which adjoin the vertical slot 9 adjacent the piston ring recesses 2 prevent the expansion and contraction strains of the solid piston end 1 from traveling directly onto the side B of the piston, in which instance said strains will be dispersed along the wrist pin sides of the piston.

In order to take care of the aforementioned backlap of the piston which is generally given to the lower end of pistons from the throwing-thrust of the connecting rod, attention is called to the disposition of the vertically formed slots 8 and 9 which are diametrically opposite from one another and arranged at right angles to the wrist pin openings 10. These slots 8 and 9, however, weaken the lower portion of the piston relative to the expansion and contraction thereof, but in the disposition of said slots as mentioned the bending moment of the edges 11 thereof is transferred circularly therefrom, the side portions A and B in which the slots 8 and 9 are respectively located will provide a reinforcement to the piston against the connecting rod swinging-thrust.

As shown more clearly in Figs. 3 and 5, enlarged portions 12, each of which is reinforced by the rib 13, are provided for reinforcing the bearings formed by the wrist pin openings 10.

What I claim is:

1. A piston having a tongue-shaped portion formed on its peripheral face, and a longitudinally formed slot extending into said tongue portion.

2. A one piece piston closed at one end and having a pair of longitudinally arranged diametrically opposed slots formed in its peripheral face, thereby providing disconnected peripheral portions capable of moving outwardly or inwardly without restraint, and there being a transverse slot located adjacent the closed end of the piston adjoined intermediate of its ends by one of said other slots.

3. A piston having a pair of longitudinally arranged diametrically opposed slots formed in its peripheral face, one of said slots being shorter than the other slot.

4. A piston having a tongue-shaped portion formed on its peripheral face, a longitudinally formed slot extending into said tongue portion, and a second longitudinally formed slot diametrically opposed to said first-mentioned slot.

5. A piston having a solid end portion and a T-shaped slot formed in the peripheral face of the piston in which the transverse portion of said T-shaped slot is disposed adjacent the solid end of the piston, said slot forming adjacent disconnected peripheral portions which are capable of unrestrained outward and inward movement.

6. A piston having a solid end portion, a tongue-shaped portion formed on the peripheral face of the piston, having its face end located adjacent the solid end portion, and a longitudinally formed slot extending from the lower end of the piston into said tongue portion.

7. A piston having a tongue-shaped portion formed on its peripheral face, a T-shaped slot oppositely disposed from said tongue-shaped slot, and a longitudinally formed slot extending into said tongue portion.

8. A piston having a tongue-shaped portion formed on its peripheral face, a longitudinally formed slot extending into said tongue portion, and a second longitudinally formed slot diametrically opposed to said first-mentioned slot adjoining a transversely formed slot.

9. A piston having a solid end portion, a tongue-shaped portion formed on the peripheral face of the piston, having its free end located adjacent the solid end portion, a longitudinally formed slot extending from the lower end of the piston into said tongue portion, and a T-shaped slot disposed opposite from said tongue portion.

10. A one piece piston provided with a solid end portion and a skirt portion, said skirt portion having a longitudinally extending slot formed through the thickness of its wall, said slot extending from the rear edge of the skirt portion and forming adjacent disconnected portions in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

UNITED STATES PATENT OFFICE. 1733

ELMER C. LONG, OF QUINCY, ILLINOIS.

PISTON FOR INTERNAL-COMBUSTION MOTORS.

Application filed December 9, 1918. Serial No. 265,948.

To all whom it may concern:

Be it known that I, ELMER C. LONG, a citizen of the United States of America, and a resident of the city of Quincy, in the county of Adams and State of Illinois, have invented certain new and useful Improvements in Pistons for Internal-Combustion Motors, of which the following is a specification.

The primary object of this invention is to provide an improved piston for internal combustion motors, whereby a better working relation is established between the piston and its cylinder during the operation of the motor under highly heated conditions.

Another object is to provide an improvement in a piston, whereby the working thrust due to the piston forcing the connecting rod is received by only one part of the piston surface, and not on the whole piston as heretofore.

Other and further objects will appear in the specification and be specifically pointed out in the appended claims, reference being had to the accompanying drawings exemplifying the invention, and in which,

Figure 1 is a side elevation of this improved piston.

Figure 2 is a side elevation opposite to that shown in Fig. 1.

Figure 3 is a side elevation taken in the direction of the arrow 3 in Fig. 1.

Figure 4 is a vertical section taken on the line IV—IV of Fig. 1.

Figure 5 is a transverse section taken on the line V—V of Fig. 4.

Referring to the drawings 1 designates a solid head of the piston, 2 the main body portion, and 3 the wrist pin bearings. Formed on one side of the main body portion 2, as shown more clearly in Fig. 1, is a cut out portion 4 which is formed in the periphery of the piston by the pair of longitudinal slots 5 and transverse slot 6, which adjoins the slots 5 adjacent the solid end 1 of the piston, said slots at their opposite ends continuing to the lower end 7 of the piston. The cut out portion 4 is held in its peripheral position by a pair of integrally formed connecting portions 8ª, each of said portions extending from each of the wrist pin bearings 3.

Formed in the piston periphery opposite to the cut out portion 4 is a tongue shaped portion 8, having its free end extend adjacent the solid end 1 of the piston, said tongue portion being separated from the body portion 2 of the piston by a pair of longitudinal slots 9 and a transverse slot 10, said slots 9 at their lower ends terminating at a distance from the end 7 of the piston.

From the aforesaid detailed construction of this improved piston, the body portion 2 thereof having the cut away portion 4 and tongue shaped portion 8 formed therein, will be resilient, as against the ordinary type of piston, and inasmuch as the exploding impulses of internal combustion motors are effective on the solid heads of the pistons, a higher temperature will be given to the solid piston end or head, as against the body portion of the piston on which is contained the cylinder engaging portion.

In this connection, with applicant's improved construction, since the body portion 2 or cylinder engaging portion has separated portions, independent contracting and expanding extents can be carried out in the piston between the body portion 2 and the solid head 1 of the piston.

Inasmuch as the cut out portions provide resiliency to the body portion 2 of the piston, in order to take care of the greatest amount of expansion of the solid head of the piston, the periphery of the piston adjacent the solid head is made smaller in diameter than the remaining portion of the piston, as designated at 11, as the piston rings when mounted in the recesses 12 will provide the cylinder fit for the solid head 1, whereas the cut out portion 4 and tongue shaped portion 8 of the body portion 2 of the piston will yieldingly bear against the cylinder wall.

In addition to the aforesaid, in the operation of this improved piston, when the piston is driving the connecting rod downwardly on the line 13, and in the direction of the arrow 14 in Fig. 4, the forcing thrust of the piston on the connecting rod is received by the connecting portions 8ª and borne by the cut away portion 4 against the cylinder wall, thereby relieving the remaining portions of the piston from the thrust, and hence forth preventing bending strains being carried to the tongue shaped portion 8, and consequently preventing back slap of the piston.

What I claim is:

1. A one piece piston having a portion entirely separated and unsupported from its peripheral face, between the wrist pin bearings thereof, the peripheral wall of said

piston which is oppositely disposed from said separated portion being slotted.

2. A piston having a portion separated and unsupported from its peripheral face, and a cut out tongue shaped portion formed in the periphery of said piston oppositely disposed from said separated portion.

3. A piston having a portion separated and unsupported from its peripheral face, means for supporting said separated portion from the interior of the piston, and a cut out tongue shaped portion formed in the periphery of said piston oppositely disposed from said separated portion.

4. A one piece full skirted hollow piston having a portion of its peripheral face entirely cut away, between the wrist pin bearings thereof thereby forming a separated peripheral portion, and supporting means secured to said separated portion and the wrist-pin bearings of the piston, for holding said separated portion in peripheral alinement with the peripheral face of the piston.

5. A piston having a solid end portion and a full skirt portion formed integral therewith, and there being a part of said skirt portion entirely cut away and wholly unsupported from the main body portion thereof.

6. A piston having a solid end portion and a skirt portion formed integral therewith, there being a part of said skirt portion entirely cut away and wholly unsupported from the main body portion thereof, and there being a tongue shaped portion formed in said skirt portion.

7. A hollow piston having a portion of its peripheral wall entirely cut away between the wrist pin bearings thereof, thereby forming a separated section, said peripheral wall bearing a slot in opposite disposition to said section and supporting means secured to said section and the wrist pin bearings of the piston for holding said section in alinement with the peripheral wall.

8. A full skirted one piece piston having a portion of its peripheral wall entirely cut away and wholly separated from the remaining portion of the peripheral wall, said cut away portion being integrally supported from the interior of the piston.

9. A one piece piston having a pair of slots cut entirely through the thickness of its peripheral wall, said slots leading from the open end of the piston to a point adjacent the lowermost packing ring recess thereof and being joined by a transversely extending slot thereby forming a disconnected portion, and integral means provided for supporting said disconnected portion between said slots.

UNITED STATES PATENT OFFICE

ELMER C. LONG, OF QUINCY, ILLINOIS, ASSIGNOR, BY MESNE ASSIGNMENTS, TO SECURITY TRUST COMPANY, OF DETROIT, MICHIGAN, A CORPORATION OF MICHIGAN

PISTON FOR INTERNAL COMBUSTION MOTORS

Application filed March 7, 1919. Serial No. 281,178.

The primary object of this invention is to provide an improved piston for internal combustion motors, whereby a better working relation is established between the piston and its cylinder during the operation of the motor under highly heated conditions.

Another object is to provide an improvement in a piston whereby the working thrust due to the piston forcing the connecting rod is received by certain parts of the piston only.

A further object is in providing an improved piston with means formed on that portion thereof which will engage the cylinder wall, whereby a better fitting relation can be given to the piston relative to the cylinder during the machining of the piston so that the fitting relation will be approximately the same during the operation of the motor in which this improved piston or pistons is contained.

Other and further objects will appear in the specification and be specifically pointed out in the appended claims, reference being had to the accompanying drawing exemplifying the invention, and in which,

Figure 1 is a side elevation of this improved piston.

Figure 2 is an elevation of the wrist pin side of the piston.

Figure 3 is a vertical section taken on the line III—III of Fig. 1.

Figure 4 is a vertical section taken on the line IV—IV of Fig. 2.

Figure 5 is a horizontal section taken on the line V—V of Fig. 3.

Figure 6 is an elevation of the lower end of the piston.

Referring to the drawing, 1 designates the solid end portion of the piston, having the usual piston ring recesses 2 and the main body portion 3, said main body portion having opposing wrist pin bearing sides or faces 4.

Formed in the periphery of the piston and in the body portion 3 thereof between the wrist pin side portions 4 and on each side of the piston is a pair of segmental portions 5, said pairs of portions 5 being divided by a slanting or inclining slot 7, and are further divided from the body portion of a piston by the vertical slots 8 and the transverse slot 9.

Each cut out portion 5 is held in its peripheral position by an integrally formed connecting portion 10, there being a pair of said connecting portions extending in opposite directions from each of the wrist pin bearings 11.

In the construction of this improved piston, the slots 7, 8 and 9 which form the segmented portions 5 are preferably cut in the body portion 3 of the piston, and in the machining of this piston the upper portion thereof adjacent the solid end 1 is turned to a lesser diameter than the body portion 3, as indicated by the numeral 12.

In setting forth the advantages gained by a piston of this improved construction, it will be necessary to call attention to the solid piston construction, in which the piston was turned down to a size considerably smaller than the diameter of the cylinder to allow for the expanding of the piston, the fit of the cylinder being provided by the piston or packing rings, but from experiment, it has been found that the pistons of internal combustion engines would at the same have too great an expansion, whereby considerable friction was created on account of the pistons fitting too tightly in the cylinder when the same became highly heated, and if the piston were turned down to a smaller diameter to avoid the extreme expanding fit of the piston during the highly heated condition, the piston would be too loose in the cylinder under normal conditions. Owing to providing the piston with segmental bearing faces against the cylinder wall. With this improved construction, on account of the segmental portions 5 provided An opposite diametral relation in the peripheral face of the piston, the body portion 3 thereof cut in material to a size slightly less in diameter than the cylinder wall so that when a motor equipped with this improved piston is put in operation, the piston fit is provided between the body portion of the piston and the cylinder under a small degree of heat, whereas when highly heated conditions exist the body portion of

the piston comprised of the wrist pin sides 4 and separated portions 6 can expand without fitting too tightly against the cylinder wall, as the expansion thereof will be taken up by the slots 7 and 11, as expanding and contracting resiliancy is given to the body portion 3 of the piston by the separated portions thereof.

The expanding fit given to the body portion 3 of the piston as just related will allow the upper portion of the piston adjacent the solid end 1 to be turned to a lesser diameter as indicated at 12 on account of the fact that a proper packing and fitting relation is provided when the piston rings are mounted in their respective recesses 2, as said upper portion of the piston will be turned down to such a degree whereby the extreme expansion of the piston will not cause the peripheral face of the upper portion of the piston to engage the cylinder wall at any time.

In addition to the connecting portions 10, supporting their respective separated portions 6 of the piston, said connecting portions 10 serve to reinforce said separated portions 6 and hold them outwardly against the forcing thrust of the connecting rod so that back slap of the piston is prevented as it is to be noted that said separated portions 6 are angularly arranged relative to the wrist pin bearings 11 of the piston.

Inasmuch as the separated portions 6 will be rigidly held against bending against the forcing thrust of the piston from the connecting rod of the piston, the dividing slanting slots 7 of the pairs of separated portions 6 will prevent the wearing of a raised portion in the cylinder wall.

What I claim is:

1. A one piece piston having a solid walled skirt portion, said skirt portion having a pair of sections of its peripheral wall entirely cut away thereby forming separated peripheral parts, and integral means for supporting said sections in peripheral alinement with the peripheral face of said skirt portion.

2. A piston having a solid walled skirt, said skirt having a pair of opposing portions of its peripheral wall entirely cut away, thereby forming separated peripheral portions, and integral supporting means secured to said separated portions and the wrist pin bearings of the piston for holding said separated portions in peripheral alinement with the peripheral face of the skirt.

3. A one piece piston having a full skirt portion, said skirt portion having opposing pairs of sections entirely cut away and wholly separated from its peripheral face, said sections being extended to one end of the piston.

4. A piston having a solid end portion and a skirt portion engaging the entire circumferential wall of the cylinder in which it reciprocates, said skirt portion having a series of sections which are wholly separated from one another, said skirt portion having a pair of wrist pin bearings formed integral therewith, and a rib extending from each of said bearings to a respective section.

5. A piston having a head and a cross-head structure connected thereto and comprising diametrically opposite slippers, wrist pin bosses between the slippers and means joining said bosses and slippers together, the said joining means being resiliently yieldable.

6. In a piston for an internal combustion engine, the combination of a piston head having a depending ring flange, two pairs of curved guide members oppositely disposed with relation to the axis of the piston, the curved members of each pair thereof being separated from the ring flange and from each other by continuous air gaps, and webs carrying wrist pin bosses, the said curved members, piston head and webs being united in an integral unitary structure.

7. In a piston for an internal combustion engine, the combination of a piston head having a depending ring flange, two pairs of curved guide members oppositely disposed with relation to the axis of the piston, the curved members of each pair thereof being separated from the ring flange and from each other by continuous air gaps, wrist pin bosses and webs connecting the wrist pin bosses with certain of said guide members, said guide members, piston head and webs being united in an integral unitary structure.

PROVISIONAL SPECIFICATION.

Improvements in Petroleum or Liquid Hydrocarbon Engines.

I JAMES ROOTS 24 Adam Street Portman Square W. Engineer do hereby declare the nature of this invention to be as follows:—

The object of this invention is the prevention of the leakage of vapour and the consequent smell. For cylinders having pistons attached directly to the connecting rod, in which the piston acts also as the crosshead and the cylinder as a guide I cast an addition to the front of the piston of a deep-groove or U shaped section the smaller periphery of which casting is screwed or bolted to the piston and the other periphery is of the same diameter as the piston and carries a piston ring; the front view has the appearance of a disc with a long narrow slot to allow the movement of the connecting rod; the space within is deeper at the sides of the slot than at the end. The leaking vapour is caught and condensed in the space so formed and utilised for lubricating the piston, the remainder may be allowed to pass back by a pipe screwed in the cylinder or air may be drawn through it by means of a second small port. The connecting rod may be connected directly to the vapour catching cover instead of to the piston. For engines having a crosshead and guide I make both cylindrical and place one or more rings on the periphery of the crosshead so that it acts like a second piston the space between the two catching and condensing the petroleum vapour, or passing it to the reservoir.

Dated Nov. 28/90.

JAMES ROOTS.

COMPLETE SPECIFICATION.

Improvements in Petroleum or Liquid Hydrocarbon Engines.

I, JAMES ROOTS, of 24, Adam Street, Portman Square, London, do hereby declare the nature of this invention and in what manner the same is to be performed to be particularly described and ascertained in and by the following statement:—

This invention has for its object, the prevention of any escape or leakage of petroleum vapour from the interior of the cylinder past the piston to the atmosphere, thereby avoiding the unpleasant smell usual to engines of this class as hitherto constructed.

It consists in providing that any escape or leakage of vapour past the piston becomes pocketted and condensed in an annular or other shaped chamber fitted to the piston. A portion of the condensed vapour caught in the space so formed is utilised for lubricating purposes, the remainder may be allowed to flow back to

[Price 8d.]

[Price/-

the reservoir by a pipe screwed into the cylinder, or it may be again drawn into the cylinder by the suction stroke of the piston by way of a small port provided for the purpose.

In order that my invention, and the manner of its application may be fully understood, I have appended the accompanying sheet of drawings, in which Figures 1 and 2 are a sectional plan and front sectional elevation respectively of an engine cylinder, in which the piston A is attached directly to the connecting rod B, the piston acting as the crosshead, and the cylinder as a guide.

To engines of this description, I fit an additional piece C with a deep groove D, the periphery at the front end being provided with a piston ring E, the neck F is of sufficient width and depth to allow of the free up and down movement of the connecting rod B (see Figure 2). In the chamber or space formed by the groove D, the vapour that passes the piston is caught and condensed to serve for lubricating purposes, as hereinbefore stated, and excess may be passed back to the reservoir by the pipe G.

Figures 3 and 4 represent the arrangement adopted for engines having crosshead and guide. The crosshead H is made cylindrical with one or more rings on its periphery forming, as it were, a second piston, the space or chamber D formed between the two pistons, pocketting and condensing the vapour in the same manner and for the same purpose, as described with reference to Figures 1 and 2.

Having now particularly described and ascertained the nature of this invention and in what manner the same is to be performed I declare that what I claim is:—

In petroleum or liquid hydrocarbon engines, forming a chamber attached to the piston for the purpose of catching and condensing the leaking vapour in (1) the manner described, and shown in Figures 1 and 2, and (2) the manner described, and shown in Figures 3 and 4.

The 1st day of September 1891.

H. GARDNER,
Patent Agent, 166, Fleet Street, London,
Agent for the said James Roots.

Redhill: Printed for Her Majesty's Stationery Office, by Malcomson & Co., Ltd.
[G. 4971—125—11/99

A.D. 1890. Dec. 1. N° 19,559.
ROOTES'S COMPLETE SPECIFICATION

(1 SHEET)

FIG. 1.

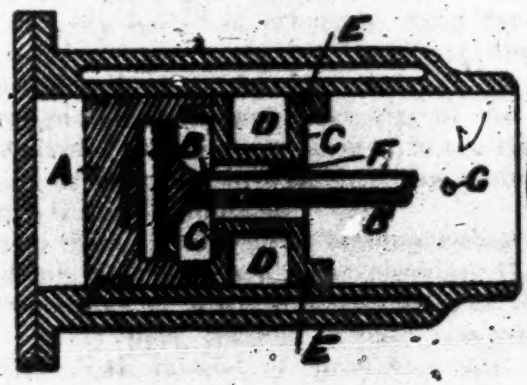

FIG. 2.

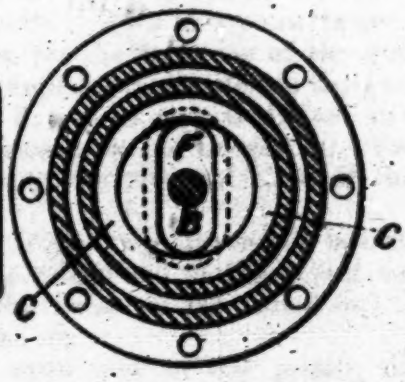

FIG. 3.

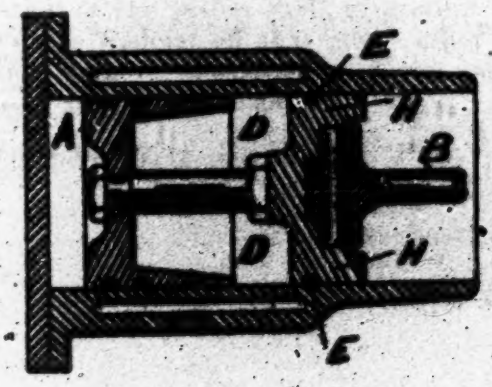

FIG. 4.

[This Drawing is a reproduction of the Original on a reduced scale]

1742

attachment of the stays to the closed end of the piston may be effected by forming the gudgeon supporting means into a truncated cone shaped piece extending towards the back of the piston and flanging this truncated cone shaped piece at that end which comes in contact with the closed end of the piston. Also in some cases the body of the piston may be provided with a circular recess and the gudgeon may be supported in a separate hat shaped piece with upturned circular flanges fitting inside the piston and bearing on the boss part. This turned-up flange is pierced and provided with bearings to receive the gudgeon pin, and the central part of the hat piece extends to the closed end of the piston and is suitably bolted or otherwise fixed thereto. With this construction it is not necessary to pierce the body of the piston for the reception of the gudgeon pin and the bulk of the force of the working fluid is transmitted to the gudgeon pin through the hat piece. The rim of the hat piece may if desired in some cases be riveted or otherwise secured to the recessed part of the piston. Ventilation may be provided conveniently by piercing the rim and sides of the hat piece in a suitable manner.

In some cases in which the bracing means from the gudgeon pin bearings to the back of the piston are made circular, the closed end of the piston may be bellied outwards or inwards so as to make the forces on the closed end of the piston, mainly pure tension or pure compression.

In some cases instead of providing the open end of the piston with a strengthening groove I prefer to use a bead or roll for the purpose of strengthening the open end of the same.

Further in those cases in which a number of connecting-rods are used or if a single connecting-rod be divided at its end, additional supporting means for the gudgeon pin may be supported on stays fixed to the rear end of the piston. In this way the centre part of a flat ended piston may be supported directly from the gudgeon pin and the pressure of the working fluid on the piston transmitted through the stays above mentioned. It is important to provide for ventilation of the piston shell to prevent overheating.

It will be understood that many other modifications might be made to this invention without departing from the spirit of the same as set out at the beginning of this specification.

Dated this 27th day of July, 1907.

Agents.

COMPLETE SPECIFICATION.

"Improvements in and relating to Motor and other Pistons".

I, JOHN VERNON PUGH, of Uniting House, Allesley, in the County of Warwick, Engineer; do hereby declare the nature of this invention and in what manner the same is to be performed to be particularly described and ascertained in and by the following statement:

This invention relates to improvements in the construction of pistons of the trunk type in which the body of the piston is formed of comparatively thin metal by pressing, stamping, spinning or similar manipulating means, and especially to pistons for internal combustion motors.

It has already been proposed to form the body of a piston in this way but practical difficulties arise in attaching the gudgeon pin to the piston body in a manner at once secure, convenient and light.

The object of the present invention is to overcome these difficulties hitherto associated with trunk pistons made of thin, rolled or otherwise treated metal.

The present invention consists broadly in providing a piston of the type above indicated, with a gudgeon pin supporting means arranged to add stability to the structure of the piston. More specifically this invention consists in attaching the gudgeon pin supporting means to the sides and or back of the piston body in such a manner as to securely attach said means to the piston and at the same time lend a bracing or supporting effect to the rear or top face of the piston which is subjected to the pressure of the working fluid.

Referring now to the accompanying drawings which form part of this specification:

Figure 1 shews a sectional elevation of one form of the present invention in which a hat shaped piece is secured to the flat end of the piston and also to the body of the same;

Figure 2 is a sectional elevation of a modification in which a circular cone shaped member is secured to the closed end of the piston and provided with bossed portions to surround the gudgeon pin;

Figures 3 and 4 shew in elevation and plan a construction in which two separate strut-like members are attached to the sides and closed end of the piston by riveting or other means;

Figure 5 shews a construction similar to that of Figure 2, with the addition of an extra supporting strut from the centre of the gudgeon pin to the closed end of the piston;

Figures 6 to 9 illustrate various forms of closed ends for the pistons;

Figures 10 to 12 illustrate a construction in which separate gudgeon pin supporting struts are used which are attached to the closed end and the sides of the piston, portions being continued downwards and attached at a low point to the piston. In this figure also are shewn additional pieces for imparting strength to the bossed portions of the piston body and the gudgeon supporting means. There is also shewn in this figure a convenient construction of gudgeon pin provided with expanding means for securing it within the piston.

In carrying the invention into effect according to one form—say as applied to the construction of a motor piston, the body, *a*, of the piston is rolled, stamped or otherwise formed out of thin sheet metal say—16, B.W.G. the outside form of the piston being of course provided with the usual recesses, *b*, for the piston ring or piston rings and with strengthening recesses, *c*. In addition to these recesses, there may be provided in the body, *a*, of the piston, a thin boss, *d*, on each side for the gudgeon pin but this boss would not of itself be of sufficient strength for the supporting of the gudgeon pin and the closed end, *e*, of the piston would not of course be sufficiently strong to give the necessary resisting strength to the pressure of the working fluid. In order to supply the closed end, *e*, of the piston with this necessary strength, the end may be made dome form either concave or convex as shown in Figures 6 and 7 but this construction has the disadvantage that it would not be applicable to the present shape and form of engine cylinders.

In the case of flat closed ends on the pistons as shewn in Figures 1, 2 and 5, I prefer to support the gudgeon pin, *f*, partly from the sides, *a*, and partly from the closed ends, *e*, of the piston by means of tubular members, *g*, attached to the sides and connected to the back or closed end, *e*, of the piston or by strut or stay members, *h*, see Figures 3 and 4 attached to the sides and closed ends of the piston. This tubular member or the ends of the struts may be welded or riveted to the body of the piston as shewn at, *j* or any other suitable form of fixing the gudgeon pin supporting means to the body of the piston may be employed. In some cases as shewn in Figures 10 to 12, portions, *a*, of the

strut-like members, *k*, may be continued downwards and attached to the body, *a*, by riveting or by other suitable means, portions of the body, *a*, being bulged in at the points, *v*, where the members, *k*, meet the body, *a*, in order that the heads of the rivets when rivets are employed may lie beneath the external surface of the piston.

The gudgeon supporting means may in some cases be provided with bent over flanges, *k*, by which they are fixed to the closed end, *e*, of the piston; these flanges, *k*, may be bent inwards as shewn in Figures 1, 2, 3 and 5 or outwards as shewn in Figure 1 on the right hand side.

The gudgeon supporting means are also provided with bossed out portions, *r*, to encircle the gudgeon pin. In some cases these bosses, *r*, are provided with strengthening pieces, *s*, surrounding them as shewn in Figures 10 to 12.

It will be seen that by this construction, the flat closed end, *e*, of the piston is braced and supported by means of the stays which are connected to the gudgeon supporting means. In this way the pressure of the working fluid is transmitted from the back of the piston to a great extent through the stays placed between the gudgeon supporting means and the closed end of the piston. The attachment of the stays to the closed end of the piston may be effected as shewn in Figures 1, 2, and 5, by forming the gudgeon supporting means into a truncated cone shaped piece extending towards the back of the piston and flanging this truncated cone shaped piece at that end which comes in contact with the closed end, *e*, of the piston. Also in some cases the body of the piston may be provided with a circular recess, and the gudgeon may be supported in a separate hat shaped piece, with upturned circular flanges fitting inside the piston and bearing on the boss part. This turned-up flange is pierced or bossed out and provided with bearings to receive the gudgeon pin and the central part of the hat piece extends to the closed end of the piston and is suitably bolted or riveted or otherwise fixed thereto. With this construction the bulk of the force of the working fluid is transmitted to the gudgeon pin through the hat piece. The rim of the hat piece may if desired in some cases be riveted or otherwise secured to the recessed part of the piston. Ventilation may be provided conveniently by piercing the rim or sides of the hat piece in a suitable manner.

In some cases the thin bosses, *d*, on the body, *a*, of the piston are provided with strengthening pieces, *t*, which may be riveted or otherwise secured to the body, *a*. this modification is shewn in Figures 10 to 12.

In some cases in which the bracing means from the gudgeon pin bearings to the back of the piston are made circular, the closed end of the piston may be bellied outwards or inwards *m m* to make the forces on the closed end of the piston, mainly pure tension or pure compression, as shewn in Figures 8, 9, 10, 11.

In some cases instead of providing the open end of the piston with a strengthening groove, *m*, I prefer to use a bead or roll, *n*, for the purpose of strengthening the open end of the same, as shewn in Figure 2.

Further in these cases, (see Figure 5) in which a number of connecting rods are used or if a single connecting rod, *o*, be divided at its end, additional supporting means for the gudgeon pin, *f*, may be provided by means of stays, *g*, fixed to the rear end, *e*, of the piston. In this way the centre part of a flat ended piston may be supported directly from the gudgeon pin and the pressure of the working fluid on the piston transmitted through the stays, *g*, above mentioned. It is important to provide for ventilation of the space between the gudgeon pin supporting means and the piston shell to prevent overheating.

It is to be understood that the bossed strengthening pieces, *t* or *s*, described above with reference to Figures 10 to 12 may be employed with any of the other modifications described. Further in some cases as in Figures 3 and 4, the bosses, *d*, are omitted and their place is taken by plain holes in the body, *a*,

of the piston, the bosses, *r*, in this case being extended out from the strut portions, *h*, sufficiently to meet the body, *a*.

Any suitable arrangement for securing the gudgeon pin may be employed, the form illustrated in Figures 10 to 12 being illustrative of one form only.

It will be understood that many other modifications might be made to this invention without departing from the spirit of the same as set out at the beginning of this specification.

Having now particularly described and ascertained the nature of my said invention and in what manner the same is to be performed, I declare that what I claim is:—

1. A trunk piston having a body formed of comparatively thin metal by pressing, stamping, spinning or similar manipulating means, and gudgeon pin supporting means arranged to add stability to the structure of the piston, said supporting means being formed of comparatively thin metal by pressing, stamping, spinning or similar manipulating means, substantially as described.

2. In a piston according to Claim 1, gudgeon pin supporting means comprising a tubular body part having bossed out portions projecting towards inwardly bossed portions on the piston body arranged to embrace the gudgeon pin, and attached to the closed end of the piston by riveted flanges, welding or the like with or without flanges or extended portions for attachment to the sides of the piston body near the open end, substantially as described.

3. In a piston according to Claim 1, gudgeon pin supporting means as set forth in Claim 2, additional strut members between the centre portion of the gudgeon pin and the closed piston end, substantially as described.

4. In a piston according to Claim 1, gudgeon pin supporting means comprising stamped, pressed or otherwise suitably manipulated metal strut members having bossed portions to encircle the gudgeon pin and extended portions for attachment to the closed end and sides of the piston body, substantially as described.

5. The improved pistons hereinbefore described, with reference to the accompanying drawings.

Dated this 22rd day of January, 1908.

DEFENDANTS' EXHIBIT 4-H(18).
Prior Art Patent.
British Patent No. 6826 of 1912,
To William Frederick Rainforth.
(Filed January 27, 1934.)

N° 6826

Date of Application, 19th Mar., 1912—Accepted, 20th June, 1912

COMPLETE SPECIFICATION.

Improvements in or relating to Pistons.

We, WILLIAM FREDERICK RAINFORTH, Engineer, of 1, Acacia Road, Acton, London, W., and D. NAPIER & SON, LIMITED, Engineers, of Acton Vale, London, W., do hereby declare the nature of this invention and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

This invention relates to pistons and in particular to pistons of the trunk type as used with single acting engines. The object of the invention is to produce a piston which at its outer end shall so fit the cylinder as not to knock therein at the reversal of stroke, and yet such as will not be liable to seize from being too good a fit.

According to this invention the piston has one end slit to provide yielding portions which prevent noisy working. One or more slits may be used each of which may have both its ends closed and they may be made with their general direction along the length of the piston. The piston may conveniently have a portion at or towards its outer end of enlarged diameter and slit, whereby it may be sprung into the cylinder. The slits may be of any desired number and may be arranged either parallel to the direction of stroke, or inclined thereto, and in order to promote lubrication and prevent scoring, the inner end of one slit, when these are inclined to the length of the piston, may be arranged to overlap the path of the outer end of the next adjacent slit.

In the accompanying drawings—

Figure 1 is an elevation showing one construction of piston according to this invention, and

Figure 2 is a similar view of a modification.

The piston A is an ordinary construction so far as the inner end thereof, the rings B and the gudgeon pin C, are concerned, but between the points A^1 A^2 the diameter is larger than between the points A A^1 while the extreme outer end between the points A^2 A^3 is reduced either to the same diameter as that between A and A^1 or even to a less size. Slits D are formed in the wall of the piston at the enlarged portion extending along the whole length of that portion and slightly beyond at the inner end. Each end of each slit is terminated by a circular enlargement D^1 which serves both to facilitate the operation of slitting with a saw, and to form a suitable termination to the slit from which cracks are not liable to occur.

In use the enlarged portion would not enter the cylinder freely, but owing to the presence of the slits, this portion can be slightly sprung sufficiently to enable the piston to enter the cylinder. The pressure of the sprung portions upon the walls of the cylinder prevents the outer end of the piston from having any play therein, so that at each reversal of stroke this end does not knock from side to side in the cylinder and thus the noise usually arising from such knocking is eliminated. At the same time the danger of the piston seizing at this portion is reduced to a minimum owing to the springy action produced by the slits.

The slits may be arranged to any desired number and may either be parallel

to the length of the piston or inclined thereto as shown in Figure 2. When inclined to the length of the piston the inner end of one slit may be arranged to overlap the path of the outer end of the next adjacent slit, so preventing scoring. The action of the slits is further such as to promote lubrication of the outer end of the piston and this action is enhanced when the slits are inclined as shown in Figure 2.

Obviously the slits may be arranged in a variety of ways; those hereinbefore described and illustrated are formed with both ends left closed, but they may, if desired be extended toward the outer end of the piston so as to be open at that end. If closed, as shown, the spring-like action of the intervening strips is stiffer than if the slits are continued to the outer end of the piston. Again the slits need not necessarily be straight, although straight slits are of course easier to produce by ordinary methods than curvilinear slits. Again a U-shaped slit may be formed in the outer portion of the piston, the length of the U being transverse to the axis of the piston, and transverse slits may be arranged in a variety of ways to produce springy tongue-like portions which shall produce the required result in a manner similar to that in which the slits D act.

Having now particularly described and ascertained the nature of our said invention and in what manner the same is to be performed, we declare that we are aware that it has previously been proposed to cut slots in a piston for lightness and we do not claim broadly a slotted piston, but what we do claim is:—

1. A piston slit at one end in order to provide yielding portions which prevent noisy working substantially as described.

2. A piston according to preceding Claiming Clause No. 1 which has one or more slits with closed ends the general direction of the slits being along the length of the piston.

3. A piston having a portion at or towards its end of enlarged diameter and slit whereby it may be sprung into the cylinder substantially as and for the purpose described.

4. A piston according to any one of the preceding claiming-clauses wherein the slits are inclined to the length of the piston either so that the inner end of one slit overlaps the path of the outer end of the next adjacent slit or so as not to overlap substantially as and for the purpose described.

5. The trunk piston substantially as described and illustrated in the accompanying drawing.

PROVISIONAL SPECIFICATION

Improvements in Pistons for Internal Combustion Engines.

I, SAMUEL OCTAVIUS FERRY, Engineer, of Athol Lodge, S. Leonards, Ringwood, Hants, do hereby declare the nature of this invention to be as follows:—

This invention comprises improvements in pistons for internal combustion engines, and has for its object to provide a "featherweight" piston particularly for use in automobile and aeroplane engines, and which will combine light weight with strength and simplicity of construction.

The invention consists essentially in the provision of a separate cross bar or member adapted to carry the gudgeon pin, this cross bar being attached to the piston body by any suitable means, and being slotted to allow of the necessary movement of the connecting-rod.

The cross bar preferably comprises a hollow member of substantially oblong or rectangular formation, the ends being turned or formed to fit the internal bore of the piston, and abutting against a shoulder on the piston or a reduced bore thereof.

For accommodating the gudgeon pin the member is preferably provided centrally and transversely with respect to its main axis, with two bored bosses, on opposite sides, the gudgeon pin being fastened in these bosses in any suitable manner.

In a convenient embodiment of the invention, the cross member is of substantially rectangular formation in plan and has rounded ends which are concentric with the bore of the piston and are turned accurately so as to fit securely therein. The member is adapted to abut against the reduced bore of the piston in which the piston rings are accommodated, and the working pressure of the piston on load is taken by the cross bar where it fits against the reduced bore referred to. The cross bar is further retained in place by rivets through the wall of the piston. As an alternative or addition to this manner of securing, the internal bore of the piston may be screw-threaded and the ends of the cross member threaded to suit.

Disposed at the middle point of each of the sides of the cross member is a boss projecting outwardly and the axis of these two bosses is at right angles to the main or major axis of the rectangular cross member. These bosses are suitably bored to enable insertion and retention of the gudgeon pin in place.

The piston proper can be turned or bored both on its internal and external diameters so as to be perfectly concentric.

The whole piston may be constructed of high tensile steel or the piston proper may be made of cast iron and the cross member of steel as preferred, or other suitable metals or alloys may be employed as appear desirable.

The piston and also the cross bar are advantageously drilled with holes for reducing their weight as in the usual manner.

Dated this 25rd. day of May, 1914.

COMPLETE SPECIFICATION.

Improvements in Pistons for Internal Combustion Engines.

I, SAMUEL OCTAVIUS FERRY, Engineer, of Athol Lodge, S. Leonards, Ringwood, Hants, do hereby declare the nature of this invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

This invention comprises improvements in pistons for internal combustion engines, and has for its object to provide a "featherweight" piston particularly for use in automobile and aeroplane engines, and which will combine light weight with strength and simplicity of construction.

The present invention relates to pistons of the type having a separate cross-bar or member adapted to carry the gudgeon pin, this cross-bar being attached to the piston body by any suitable means; and according to the invention this cross-bar comprises a hollow member of substantially oblong or rectangular formation, the ends being turned or formed to fit the internal bore of the piston, and abutting against a shoulder on the interior of the piston or a reduced bore thereof.

For accommodating the gudgeon pin the cross-member is preferably provided centrally and transversely with respect to its main axis, with two bored bosses on opposite sides, the gudgeon pin being fastened in these bosses in any suitable manner.

It will be understood that the invention may be embodied in several different constructions and forms of piston, but I will describe as an example a convenient embodiment of the invention for use particularly in automobile work.

This embodiment is illustrated in the drawings in which:

Figure 1 represents a longitudinal view in cross-section taken on line 1—1 of Figure 2.

Figure 2 is a view similar to Figure 1 but turned through an angle of 90° and being taken on line 2—2 of Figure 1.

Figure 3 is a cross sectional view on line 3—3 of Figure 1.

The piston body (which is represented by the numeral 1) is itself reduced in thickness as far as is feasible so as to be particularly light and two large openings 2, 2, are formed therein to provide a further reduction in weight. At the top of the piston two grooves are provided for the accommodation of piston rings 3 and the piston at this portion is provided interiorly with a reduced bore which forms a shoulder, the function of which will be hereinafter described. The bottom end of the piston is provided with a small inwardly projecting concentric flange 5 in accordance with usual practice.

The cross-member which forms the main part of the present invention is of substantially rectangular formation in plan as shown in Figure 3 and has rounded ends 7 which are concentric with the bore of the piston and are turned accurately to fit securely therein. The upper edge of the cross-member 6 is adapted to abut against the shoulder in the upper portion of the interior of the piston and the working pressure of the piston on load is taken by the cross bar 6 where it fits against this shoulder.

To retain the member 6 in position rivets 8 are provided whereby the same is firmly attached to the piston body 1. As an alternative or an addition to this manner of securing the internal bore of the piston may be screw-threaded and the curved ends 7 of the cross-member itself threaded to suit.

Disposed at the middle point of each of the sides of the cross-member 6 is a boss 9 projecting outwardly and the axis *a a* of these two bosses is at right angles to the main or major axis *b b* of the rectangular member. The bosses 9

are suitably bored to permit insertion of the gudgeon pin 10 in place, and to maintain the latter in position a tapered peg or wedge 11 is forced through a tapered hole formed continuously through one of the bosses 9 and one end of the gudgeon pin 10.

To give further lightness to the complete device two circular perforations 12 are provided which are continued through the ends of the rectangular member 6 and through the wall of the cylinder 1 corresponding thereto.

The piston proper 1 is turned or bored on both its internal and external diameters so as to be perfectly concentric and it will be seen from Figure 2 that the body 1 is of reduced diameter at 13, the portion below this zone of reduced diameter serving to act as a bearing surface to maintain the piston in alignment with respect to the cylinder when working as in usual practice.

The whole of the piston including the piston body 1 and the rectangular cross-member 6 may be formed of high tensile steel or the piston proper may be made of cast iron and the cross-member of steel as preferred or other suitable metals or alloys may be employed as appear desirable or advisable.

Having now particularly described and ascertained the nature of this invention, and in what manner the same is to be performed, I declare that what I claim is:—

1) A piston for use in connection with internal combustion engines, and of the type having a separate cross-bar or member adapted to carry the gudgeon pin, this cross-bar or member being attached to the piston body by any suitable means; characterised in that the cross-bar comprises a hollow member of substantially oblong or rectangular formation, the ends being turned or formed to fit the internal bore of the piston and abutting against a shoulder on the interior of the piston or a reduced bore thereof.

2) A piston as set forth in Claim 1 wherein the cross-member is provided centrally and transversely with respect to its main axis with two bored bosses on opposite sides, the gudgeon pin being fastened in these bosses in any suitable manner.

3. A featherweight piston for use in connection with internal combustion engines constructed substantially as described and illustrated.

Dated this 26th. day of June, 1914.

COMPLETE SPECIFICATION.

Improvements in Pistons for Reciprocating Engines.

We, Ernest Walter Hives, of Station Road, Mickleover, Derby, Engineer, and Rolls-Royce Limited, of Nightingale Road, Cumnaston, Derby, Motor Car Manufacturers, do hereby declare the nature of this invention and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

This invention relates to pistons of the trunk type, that is those in which the duty of the piston proper is combined with that of a crosshead, the walls of the cylinder acting as the crosshead guide.

In this type of piston owing to the angularity of the connecting rod at the power stroke there is a tendency to thrust the piston against one side of the cylinder, which causes a noise commonly known as "piston knock" or "piston slap". This is more noticeable in internal combustion engines and especially in those engines which otherwise are comparatively noiseless.

This is generally eliminated by making the piston with a very small clearance.

In some cases however, the end desired cannot be thus secured, such as for example where the piston is made of aluminium (in order to secure well known advantages) and the cylinder is of cast iron, in which case owing to the greater co-efficient of expansion of aluminium over that of cast iron it is necessary to allow a greater clearance, with the result that when the engine is started before the metals have expanded under the effect of the heat, a "knock" is perceptible. The object of this invention is to eliminate the "knock" in such cases.

According to this invention we attain the object by saw-cutting or splitting the skirt circumferentially at a suitable distance from the lower edge of the piston and on the side of the piston remote from that side of the cylinder against which the piston is thrust on the power stroke owing to the angularity of the connecting rod, and another saw cut or division of the skirt axially (but preferably slightly spiralled) from the first saw cut to the edge of the skirt.

In another form of our invention instead of one circumferential saw cut and an axial cut from thence to the edge of the skirt we may make two circumferential saw cuts and an axial cut extending from one to the other.

The effect of such saw cuts is to give an elasticity to that part of the skirt between the circumferential saw cut and the edge, or between the two circumferential saw cuts as the case may be, and thus enable us, as we do to machine that part slightly oval so that when cold the piston is held in close contact with the other side of the cylinder, and yet when heated that part of the skirt can contract and avoid risk of seizure.

[Price 1/-]

We are aware that it is not new to [illegible] or saw-cut a piston skirt axially, but such an arrangement has the disadvantage that the pressure exerted by the tongue or tongues so formed is not sufficiently distributed over the cylinder walls and the reactions on the piston are not such as to control the piston as desired, an objection which our invention overcomes to a large extent.

The accompanying drawing illustrates one form of our invention in which there is one circumferential saw-cut applied to an aluminium trunk piston for internal combustion engines. Fig. 1 being an external elevation showing the saw-cuts and Fig. 2 a section on the line A A of Fig. 1.

a is the circumferential saw cut, a^1 the axial saw-cut slightly spiralled, *b* is the gudgeon pin supported by bosses b^1. *c* are pressure retaining rings and c^1 pegs or dowels to prevent same from turning, *d* is an oil scraper ring d^1 a groove and d^2 holes to return surplus oil to crankcase.

Having now particularly described and ascertained the nature of our said invention, and in what manner the same is to be performed, we declare that what we claim is:—

1. A trunk piston for reciprocating engines having the skirt split or saw-cut circumferentially for a portion of its circumference on the side remote from the side of the cylinder taking the side thrust due to the angularity of the connecting rod on the power stroke, and a second saw-cut axially or slightly spiralled relative to the axis of the piston from the first saw-cut to the edge of the skirt.

2. A trunk piston for reciprocating engines having two circumferential saw cuts on the side remote from the side of the cylinder taking the side thrust due to the angularity of the connecting rod on the power stroke, and a saw cut from one to the other of the said circumferential saw cuts axial or slightly spiralled relative to the axis of the piston.

3. A trunk piston for reciprocating engines constructed of aluminium with saw cuts as claimed in Claims No. 1 and No. 2.

4. An aluminium trunk piston for reciprocating engines as illustrated in the drawings.

Piston divisé pour moteurs à explosions.

SOCIÉTÉ ANONYME DES ANCIENS ETABLISSEMENTS CHENARD ET WALCKER résidant en France (Seine).

Demandé le 18 février 1914, à 14h 40m, à Paris.
Délivré le 28 avril 1914. — Publié le 9 juillet 1914.

Cette invention a pour objet un piston pour moteurs à explosions divisé transversalement en deux parties distinctes dont l'une seulement reçoit l'action des gaz au point de vue calorifique, l'autre étant aussi isolée que possible de la précédente pour éviter l'échauffement et, par suite, les grippements.

On sait que les pistons de ce genre ovalisent les cylindres et, pour tâcher d'obvier à cet inconvénient, on leur a donné une section assez complexe que l'on obtient au tour à reproduire pour que, par dilatation, ils s'appliquent exactement contre la paroi du cylindre; d'autre part, dans les moteurs à très grande vitesse, on ne donne pas aux pistons un diamètre tout à fait aussi grand que celui de l'intérieur du cylindre pour éviter les grippements.

De ces différentes dispositions, il résulte que le piston se meut avec des chocs plus ou moins sensibles en produisant, par conséquent, un certain bruit.

Par cette invention, ces inconvénients sont radicalement supprimés et cela, d'une manière simple et pratique, sans nécessiter une main-d'œuvre excessive puisque le piston en question sera simplement usiné au tour ordinaire, comme un piston quelconque.

Au dessin annexé donné seulement à titre démonstratif :

La fig. 1 est une vue en coupe axiale verticale du piston; et

La fig. 2 est une coupe horizontale selon la ligne A-B de la fig. 1.

Comme il a été exposé, le piston comprend deux parties distinctes superposées : la partie *a*, de hauteur relativement faible sur laquelle sont appliqués les segments, et la partie *b*, de longueur beaucoup plus grande que la précédente, pour assurer un bon guidage. Ces deux parties sont complètement séparées par une gorge *c*, de largeur convenable, et elles sont seulement reliées par des cloisons *d*, au nombre de deux par exemple, comme le représente le dessin; ces cloisons ayant une section aussi faible que possible.

Pendant le fonctionnement du moteur, la partie supérieure *a* du piston reçoit seule l'action calorifique des gaz, tandis que la partie *b*, qui est séparée de la précédente par un matelas d'air, ne reçoit que la très faible quantité de chaleur qui lui est transmise par les membranes *d* et, par conséquent, l'échauffement de cette partie *b* est beaucoup moindre que celui d'un piston ordinaire; dans ces conditions, les grippements ont moins de chance de se produire et la pratique a même démontré qu'ils ne se produisaient pas du tout.

On comprend facilement qu'un tel piston peut être parfaitement ajusté dans son cylindre, au moins en ce qui concerne la par-

tie *b* et que, par conséquent, il fonctionne absolument sans aucun bruit. Il présente donc des avantages considérables sur les pistons actuellement employés et ce résultat est obtenu par un moyen extrêmement simple.

Dans le mode d'exécution représenté, les cloisons *d* qui relient les deux parties *a* et *b* du piston sont parallèles; mais il est évident qu'elles pourraient constituer un croisillon ou être disposées de toute autre façon. On peut même remplacer ces cloisons rectilignes par une cloison unique circulaire, si on le désire, mais ayant toujours une section aussi faible que possible pour réduire au minimum la transmission de la chaleur de la partie *a* à la partie *b*.

résumé.

Un piston pour moteurs à explosions divisé en deux parties superposées, de longueur inégale, séparées par un matelas d'air; la partie de moindre développement recevant les segments et étant reliée à l'autre au moyen d'une ou plusieurs cloisons convenablement disposées, mais de section aussi réduite que possible pour éviter la transmission de la chaleur de la partie qui reçoit l'action directe des gaz à l'autre partie.

Divided Piston for Explosion Engines.

Societe Anonyme des Anciens Etablissements CHENARD & WALCKER, residing in France (Seine)

Applied for February 18, 1914, at 2.40 P.M. at Paris,
Granted April 28, 1914—Published July 9, 1914.

The object of the present invention is a piston for explosion engines divided transversely into two distinct parts, one of which only receives the heating effect of the gases, the other part being insulated as much as possible from the preceding one in order to prevent heating, and consequently, seizing.

It is known that pistons of this kind cause the cylinders to wear into an oval shape and, in order to try and eliminate this inconvenience, they are given quite complex sections by machining them on reproducing or copying lathes, in order that upon expansion, they may closely fit the walls of the cylinders; on the other hand, the pistons in high-speed engines are not given a diameter quite as large as that of the inside of the cylinder, in order to prevent seizing.

The result of these different arrangements is that the piston moves with more or less noticeable shocks, producing as a consequence, a certain amount of noise.

By means of the present invention, these inconveniences are radically suppressed, this being accomplished in a simple and practical manner without the need of an excessive amount of labor, as the piston in question is simply machined on an ordinary lathe, like any other piston.

In the attached drawing given merely as an example, Fig. 1 is a sectional view through the vertical axis of the piston, and Fig. 2 is a horizontal cross-section along the line A-B of Fig. 1.

As previously stated, the piston consists of two distinct parts placed one above the other, the part *a*, of relatively lesser height on which are mounted the piston rings, and the part *b*, of considerably greater length than

the preceding in order to insure good guiding. The two parts are entirely separated by means of the groove *c*, of suitable width, and are merely connected by means of the webs *d*, for example two in number, as shown in the drawing, these webs having as thin a section as possible.

During the operation of the engine, the upper part of the piston alone receives the heating effect of the gases, while the part *b*, which is separated from the former by a cushion of air, receives but a small quantity of heat which is transmitted to it through the sections *d* and consequently, the heating of this part *b* is considerably less than that of an ordinary piston; under these conditions there is less chance of the pistons seizing and practical use has also demonstrated that no seizing at all occurs.

It will be readily realized that such a piston may be perfectly fitted in its cylinder, at least as far as the part *b* is concerned, and that it will consequently work without absolutely any noise. It therefore embodies considerable advantages over the pistons being used at the present time, and this result is secured by extremely simple means.

In the developed form shown herewith, the webs *d* which connect the two parts *a* and *b* of the piston are parallel, although it is evident that they may be of cruciform shape or be arranged in any other manner. The rectilinear webs may even be replaced by a single circular web if desired, but still having as thin a section as possible, in order to reduce to a minimum the transmission of heat from the part *a* to the part *b*.

SUMMARY

A piston for explosion engines divided into two super-posed parts of unequal length, separated by a cushion of air, the less developed portion carrying the piston rings and being connected to the other by means of one or several webs suitably disposed, but of as reduced a cross-section as possible in order to prevent the transmission of heat from the part receiving the direct action of the gases, to the other part.

Tiroir à mouvement alternatif pour moteur sans soupapes.

M. Charles-Émile SEREX résidant en France (Seine).

Demandé le 12 septembre 1911.
Délivré le 17 novembre 1911. — Publié le 25 janvier 1912.

La présente invention a pour objet un tiroir à mouvement alternatif pour moteur sans soupapes, destiné à mettre le cylindre moteur en communication avec l'admission et avec l'échappement aux instants voulus pour assurer la distribution.

Ce tiroir, qui est particulièrement applicable aux moteurs pourvus d'une chemise d'obturation concentrique au piston, est caractérisé essentiellement par :

1° L'application, dans le tiroir, d'un conduit d'échappement disposé transversalement, qui offre au gaz un passage direct, de large section, avec le minimum d'étranglement, de telle sorte que les gaz peuvent s'échapper rapidement sans rencontrer de résistance; ce conduit divise le tiroir en deux parties qui sont réunies par des entretoises latérales de forme appropriée, en contact avec les parois refroidies de la boîte du tiroir;

2° La disposition de l'extrémité du tiroir, qui est fendue et forme segment élastique, de manière que la partie pleine du tiroir soit appuyée contre le conduit d'échappement et l'obture parfaitement pendant l'admission, la compression et l'explosion, dans le but d'éviter les rentrées de gaz d'échappement dans la conduite d'aspiration des cylindres moteurs, où il règne constamment une dépression.

L'invention est représentée, mais à titre d'exemple seulement, dans le dessin annexé, dans lequel :

La fig. 1 est une coupe verticale du nouveau tiroir;

La fig. 2 est une coupe semblable, les organes étant dans une autre position;

La fig. 3 est une coupe par A-A de la fig. 1;

Les fig. 4 et 5 sont des coupes partielles par B-B et C-C de la fig. 1.

Comme on le voit sur ce dessin, le nouveau tiroir est juxtaposé à un cylindre *a*, dans lequel est disposée une chemise d'obturation mobile *b*, avec un système d'étanchéité *c*; le piston moteur se déplace dans cette chemise *b*.

Le tiroir *d* se déplace parallèlement au piston moteur; ce tiroir est logé dans une boîte cylindrique *e*, communiquant avec le cylindre par une lumière *f*.

D'autre part, cette boîte présente une ouverture d'admission *g*, et une autre ouverture *h* débouchant dans un conduit d'échappement *i*.

Dans le tiroir est pratiqué un conduit transversal *j*, destiné à permettre l'échappement; ce conduit divise le tiroir en une partie inférieure *d* et une partie supérieure *d'*, qui sont réunies par des entretoises latérales *k*.

La partie supérieure du tiroir porte une lumière d'admission *l*; le bord supérieur de cette lumière est prolongé par un trait de

sce *m* (fig. 1), et il est fendu en *n*, de manière à former une sorte de segment *o*. Par un moyen approprié, par exemple par martelage, on ouvre le segment comme montré fig. 5, de telle manière que, lorsque le tiroir est engagé dans sa boîte, le segment s'applique élastiquement contre la paroi intérieure de la boîte et pousse le tiroir du côté de la lumière *h*.

Une bielle *p* imprime au tiroir son mouvement alternatif.

La fig. 1 représente le tiroir dans la position d'échappement. Les gaz sortant du cylindre *a* passent par la lumière *f*, le conduit *j*, l'ouverture *h* et, de là, dans le conduit d'échappement *i*, ainsi que l'indiquent les flèches (fig. 3). Comme on s'en rend compte par l'examen de cette fig. 3, les gaz trouvent un passage direct de large section; les entretoises *k* ne provoquent que le minimum d'étranglement. D'autre part, les gaz chauds ne sont en contact qu'avec une faible surface du tiroir.

Le segment *o*, s'appliquant élastiquement contre la paroi de la boîte *e*, appuie le tiroir contre la paroi de la boîte *e*, au-dessus de la lumière d'échappement *h*; il en résulte que les gaz d'échappement ne peuvent passer entre le tiroir et sa boîte et être aspirés par les autres cylindres dans le cas d'un moteur polycylindrique.

Dans la fig. 2, le tiroir occupe la position d'admission. Le mélange carburé entre dans la boîte du tiroir par la tubulure *g*, passe par la lumière *l* du tiroir et la lumière *f* du cylindre et pénètre dans le cylindre.

Le segment *o* s'appliquant contre la paroi de la boîte *e*, la paroi pleine du tiroir est appuyée contre la lumière *h*, de sorte que les gaz d'échappement qui peuvent se trouver dans le conduit *i* ne sont pas aspirés par le cylindre.

Les avantages du nouveau dispositif sont de permettre, dans un moteur sans soupapes comportant un tiroir à mouvement alternatif, de se débarrasser rapidement des gaz d'échappement avec le contact minimum entre ces gaz et les tiroirs, ce qui est important, d'une part, pour éviter l'échauffement du moteur, d'autre part, pour amener un bon remplissage avec les gaz frais pendant la période d'aspiration suivante.

La disposition des entretoises produit le minimum d'étranglement des gaz d'échappement; ces entretoises sont bien refroidies, puisqu'elles sont en contact avec les parois de la boîte cylindrique *e*, qui sont elles-mêmes refroidies.

La nouvelle disposition a encore pour avantage d'empêcher l'aspiration des gaz d'échappement, ce qui a une grande importance pour le rendement du moteur, surtout pendant la marche au ralenti.

Les dispositions ci-dessus ne sont données qu'à titre d'exemple; les formes, dimensions et dispositifs de détail pourront varier dans tous les cas sans changer le principe de l'invention.

RÉSUMÉ.

L'invention a pour objet un tiroir à mouvement alternatif pour moteur sans soupapes, caractérisé essentiellement par :

1° L'application d'un conduit d'échappement disposé transversalement dans le tiroir, offrant au gaz un passage direct de large section, avec le minimum d'étranglement;

2° Une forme d'exécution dans laquelle le corps du tiroir est divisé en deux parties réunies par des entretoises latérales en contact avec les parois refroidies de la boîte du tiroir;

3° La disposition de l'extrémité du tiroir formant segment, de manière que la partie pleine du tiroir soit appuyée contre la partie de sa boîte où est pratiquée la lumière d'échappement et obture parfaitement cette lumière, malgré les différences de diamètre résultant des dilatations, pendant l'admission, la compression et l'explosion, dans le but d'éviter les rentrées de gaz d'échappement dans la conduite d'aspiration.

Reciprocating Slide Valve for Valveless Engine.

The present invention relates to a reciprocable slide valve for a valveless engine, adapted to interconnect the engine cylinder with the inlet and the exhaust at the desired time in order to assure distribution.

This slide valve, which is particularly applicable to engines provided with a cut-off sleeve concentric to the piston, is characterized essentially by:

1. The provision, in the slide valve, of a discharge conduit which is transversely disposed and provides a direct passage of large cross section for the gas with a minimum of throttling, so that the gases may escape rapidly without encountering resistance; this conduit subdivides the slide valve into two parts which are interconnected by means of lateral cross members of suitable configuration, in contact with the cooled walls of the slide valve casing.

2. The arrangement of the end of the slide valve, which is split and forms an elastic segment, in such manner that solid part of the slide valve bears against the discharge conduit and cuts it off completely during admission, compression and explosion, the object being to prevent the entry of exhaust gas into the suction conduit of the engine cylinders, which is under constant reduced pressure.

The invention is illustrated, by way of example only, on the accompanying drawings, wherein:

Fig. 1 is a vertical section through the new slide valve;

Fig. 2 is a similar section with the parts in a different position;

Fig. 3 is a section along line A-A of Fig. 1;

Figs. 4 and 5 are partial sections along lines B-B and C-C of Fig. 1.

As is shown on the drawings, the new slide valve is juxtaposed to a cylinder *a*, wherein is disposed a movable cut-off sleeve *b* provided with reinforcing means *c*; The engine piston moves in this sleeve *b*.

The slide valve *d* moves parallel to the engine piston; this slide valve is housed in a cylindrical casing *e*

which communicates with the cylinder through port hole *f*.

In addition, this casing is provided with an inlet opening *g*, and another opening *h* leading into a discharge conduit *i*.

The slide valve is associated with a transverse conduit *j* which permits exhaust; this conduit subdivides the slide valve into a lower portion *d* and an upper part *d'* connected by lateral cross pieces *k*.

The upper part of the slide valve has an inlet port *l*; the upper edge of this port is extended by means of a saw cut *m* (Fig. 1) and is split at *n* in such manner as to form a sort of segment *o*. By suitable means, for example by hammering, the segment is opened as shown in Fig. 5 so that when the slide valve is in engagement with its casing the segment bears resiliently against the inner wall of the casing and urges the slide valve against opening *h*.

A rod *p* imparts the reciprocatory movement to the slide valve.

Fig. 1 shows the slide valve in the position of exhaust. The gases leaving cylinder *a* pass through opening *f*, opening *h*, and thence into the exhaust conduit *i*, as shown by the arrows in Fig. 3. As is apparent by reference to Fig. 3, the gases are afforded a direct passage of large cross section; ribs *k* offer but little obstruction. In addition, the hot gases are in contact with only a small portion of the surface of the slide valve.

Segment *o*, bearing resiliently against the wall of casing *e*, urges the slide valve against the wall of casing *e* above the exhaust port *h*; consequently, the exhaust gases can not pass between the slide valve and its casing and can not be sucked in by the other cylinders in the case of a multi-cylinder engine.

In Fig. 2, the slide valve is in the position of admission. The carbureted mixture enters into the slide valve casing through port *g*, passes through port *l* of the slide valve and port *f* of the cylinder and thus enters into the cylinder.

Segment *o* bearing against the wall of the casing *e*, the solid wall of the slide valve is urged against port *h*, so that the exhaust gases which may be in conduit *i* are not sucked in by the cylinder.

The advantages of the new construction are that it makes possible, in a valveless engine having a reciprocating slide valve, the rapid discharge of the exhaust gases with a minimum of contact between the gases and the slide valves, which is important, first to avoid heating of the engine, and secondly to permit good charging with fresh gases during the succeeding suction period.

The arrangement of the cross pieces produces a minimum of obstruction to the exhaust gases; these cross pieces are well cooled since they are in contact with the walls of cylindrical casing *e*, which are themselves cooled.

A further advantage of the new arrangement is that it prevents sucking in of the exhaust gases, which is very important for the efficient operation of the engine particularly when moving slowly.

The above embodiments are given merely by way of illustration; the form, dimensions and detail arrangement may be varied without departing from the spirit of the invention.

SUMMARY:

The invention relates to a reciprocable slide valve for a valveless engine and is characterized by:

1. The provision of an exhaust conduit disposed transversely in the slide valve, and providing a direct passage of large cross section for the gases, said passage having a minimum of obstruction;

2. A modification wherein the body of the slide valve is divided into two parts connected together by cross pieces, laterally disposed, and in contact with the cooled walls of the slide valve casing;

3. The arrangement of the end of the slide valve in such manner that the solid part of the slide valve bears against the part of the casing where the exhaust port is located, and cuts off this port completely, despite differences in diameter due to expansion, during admission, compression and explosion, the object being to prevent entry of the exhaust gas into the suction conduit.

PATENT OFFICE

Si 16.362

Tiroir à mouvement alternatif pour moteur à deux compas.

M. Charles-Émile SEREX, résidant en France (Seine).

(Brevet principal pris le 15 septembre 1911.)

Demandée le 21 août 1912.
Délivrée le 28 octobre 1912. — Publiée le 14 janvier 1913.

La présente addition a pour objet divers perfectionnements au tiroir à mouvement alternatif objet du brevet français n° 434.147.

Un perfectionnement vise le moyen d'obtenir une meilleure admission par le tiroir, entre la conduite d'échappement et celle d'admission, afin qu'il ne puisse se faire dans celle-ci des rentrées de gaz d'échappement. Ces rentrées de gaz nuisent en effet à la bonne marche du moteur en calorifi, principalement dans le cas des moteurs polycylindriques, où produisent la marche une dépression importante régnant dans la conduite d'admission. Cette dépression cause l'aspiration entre les parois du tiroir et le tiroir lui-même d'une partie des gaz brûlés, s'il n'y est pas paré.

Le perfectionnement évite aussi, par une disposition bombée des parois du canal d'échappement dans le tiroir, le grippage du tiroir sur la portance des parois, la disposition bombée permettant une certaine élasticité qui rend les dilatations moins dangereuses dans ce canal où passent toujours des gaz chauds.

Le bombage des parois du canal augmente la section de passage à l'endroit des entretoises latérales réunissant les deux faces du canal d'échappement.

Fig. 1 est une coupe verticale du tiroir à la position d'échappement.

Fig. 2 est une coupe verticale du tiroir au moment où l'admission va commencer et où l'échappement vient de finir.

Fig. 3 est une coupe verticale du tiroir à la position d'admission.

Fig. 4 est une coupe partielle de A-B de la fig. 1.

Fig. 5 est une coupe du tiroir à l'endroit où il forme segment (il est supposé vu de son cylindre).

Fig. 6 est une coupe partielle par E-F de la fig. 1.

Dans les fig. 1, 2, 3, on voit que la lumière d'admission f qui, dans la forme principal était ménagée au tiroir, a été supprimée et placée latéralement en dehors de la lumière d'échappement.

La paroi inférieure du tiroir a été fendue par un trait de scie r pour former une espèce de segment commun à la paroi supérieure m et à la paroi inférieure n. Ce segment est maintenu comme celui de la forme principale appliqué à la face contre la paroi des lumières f et h.

Les parois y et z du canal d'échappement ont été bombées pour les rendre plus élastiques et augmenter la section du passage à l'endroit des entretoises k.

Le fonctionnement du tiroir reste le même que celui décrit dans le brevet principal.

Prix du fascicule : 1 franc.

Le résultat obtenu est meilleur, par suite de la nouvelle forme d'exécution du tiroir qui permet de le maintenir appliqué exactement contre les parois du cylindre à l'endroit des lumières.

En outre le vide relatif régnant dans le canal *g* s'ajoute à l'action de l'élasticité du tiroir pour rendre plus parfaite l'obturation lorsque la paroi du tiroir masque l'ouverture *g* c'est-à-dire précisément au moment où on a besoin d'étanchéité.

résumé

La présente addition a pour objet un perfectionnement au tiroir distributeur du brevet principal n° 434.147 caractérisé par :

1° La combinaison des trois lumières débouchant dans le tiroir, la lumière d'échappement dans le prolongement de la lumière venant du cylindre et la lumière d'admission au-dessus de celle d'échappement.

2° L'adjonction de l'élasticité de la partie inférieure du tiroir de la partie supérieure et obtenue par le même moyen.

3° Une plus grande étanchéité entre les orifices d'admission et d'échappement provenant du fait que le tiroir est constamment appliqué contre eux par l'effet de son élasticité créée à ses deux extrémités comme il vient d'être expliqué au 3 *a*.

4° La forme bombée donnée aux fonds du tiroir constituant les parois du canal d'échappement, cette forme ayant pour résultat :

a) D'éviter le grippement du tiroir par dilatation en augmentant l'élasticité des parois du canal qui le traverse, les effets de la dilatation produite par les gaz chauds traversant ledit canal étant absorbés par la partie bombée.

b) D'augmenter la section du canal d'échappement à l'endroit où les dispositifs du brevet principal semblaient le rétrécir.

FRENCH PATENT NO. 16362

Translation of French patent no. 16,362, class V-8,—1st. addition to patent no. 434,147—to Charles Emile Serex residing in France (Seine), applied for Aug. 21, 1912, granted October 28, 1912, published Jan. 14, 1913.

Slide Valve with Alternating Movement for Valveless Engine.

The present addition has for object improvements in the slide valve with alternating movement, object of French patent no. 434,147.

This improvement has for its object the means of obtaining a better closure by the slide valve between the exhaust pipe and the intake so that no returns of exhaust gases into the latter will be possible. These returns of gases harm indeed the good operation of the engine when slowing down, principally in the case of multi-cylinder engines where, while running a considerable vacuum prevails in the intake pipe. This vacuum causes the exhaust between the walls of the slide valve and the slide valve itself of a portion of the burnt gases if it has not been cleared.

The improvement also avoids, by a curved arrangement of the walls of the exhaust passage in the slide valve the gripping of the slide on the periphery of the walls, the curved arrangement permitting a certain elasticity which renders any expansions less dangerous in this passage in which hot gases are always passing.

The curving of the walls of the passage increases the passage cross section at the place of the lateral cross pieces joining the two bases of the exhaust passage.

Fig. 1 is a vertical section of the slide valve in the exhaust position.

Fig. 2 is a vertical section of the slide valve at the time when the admission is going to begin and when the exhaust has just finished.

Fig. 3 is a vertical section of the slide valve in the admission position.

Fig. 4 is a partial section of A-A of fig. 1.

Fig. 5 is a section of the slide valve at the place where it forms a segment (it is supposed to be out of its cylinder).

Fig. 6 is a partial section through B-B of fig. 1.

In figs. 1, 2, 3 we see that the admission port g which in the main patent was placed above the slide valve has been moved and placed laterally above the exhaust port.

The lower part of the slide valve has been split by a saw cut r so as to form a sort of segment as in the upper part at m. This segment is hammered like n above so as to keep the slide applied against the wall of the ports g and h.

The walls y and z of the exhaust passage have been curved so as to render them more elastic and to augment the cross section of the passage in the vicinity of the cross pieces k.

The functioning of the slide valve remains the same as that described in the main patent.

The result obtained is better in consequence of the new form of construction of the slide valve which permits keeping it applied exactly against the walls of the cylinder at the place where the ports are located.

Furthermore the relative vacuum prevailing in the passage g is added to the action of the elasticity of the slide valve so as to render more perfect the closure when the wall of the slide valve masks the opening g, that is to say, precisely at the instant when we need tightness.

RESUME

The present addition has for object an improvement in the distributing slide valve of the main patent no. 434,147 characterized by:

1. The combination of the three ports opening into the slide valve, the exhaust port in the extension of the port coming from the cylinder and the intake port above that of the exhaust.

2. The addition of elasticity of the lower part of the slide valve to that of the upper part and obtained by the same means.

3. A greater tightness between the admission and exhaust ports coming from the fact that the slide valve is constantly applied against them because of its elasticity provided at its two ends as has been explained under (2).

4. The curved form given to the bases of the slide valve constituting the walls of the exhaust channel, this form having for result:

a) Avoiding the gripping (jamming) of the slide valve by expansion by increasing the elasticity of the walls of the said passage (channel) which traverses it, the effects of expansion being produced by the hot gases passing through the said channel being absorbed by the curved part.

b) Increasing the cross section of the exhaust passage at the place where the arrangements of the main patent seemed to constrict it.

OTTO LIETZENMAYER IN MÜNCHEN.

Kolben und Zylinder für Verbrennungskraftmaschinen.

Patentiert im Deutschen Reiche vom 3. Februar 1906 ab.

Die bei Verbrennungskraftmaschinen bis jetzt in Anwendung kommenden Arbeitskolben, in welchen zugleich das Kreuzkopflager angebracht ist, haben den Übelstand, daß die Schmierung dieses Kreuzkopfgelenkes erschwert und das Nachsehen der Kreuzkopflager während des Betriebes unmöglich ist; außerdem verziehen sich bei großen Durchmessern die Kolben sehr leicht, was auf die Kraftübertragung vom Kolbenboden zum Gelenkbolzen durch die Kolbenseiten zurückzuführen ist. Zum Unterschiede von diesen bekannten Bauarten wird bei dem den Gegenstand vorliegender Erfindung bildenden Kolben der Arbeitsdruck zentral durch die Rippen *a* auf den Gelenkbolzen übertragen, und es wird ferner der führende Teil des Kolbenzylinders bei *b* kreuzkopfartig ausgespart, wodurch die Führung in keiner Weise beeinträchtigt wird und bei ungleicher Materialerwärmung von Zylinder und Kolben kein Klemmen des letzteren auftreten kann. Dabei wird für die Lager der gegabelten Pleuelstange mehr Platz geschaffen, so daß bei diesen Lagern der Flächendruck geringer gehalten werden kann. Wird nun der Zylinder auf der Kurbelseite in ähnlicher Weise wie der Kolben so weit ausgespart, daß er als Geradeführung wirkt und daß in der äußersten Totlage des Kolbens das Gelenk gerade noch zum Vorschein kommt, so ist dadurch eine leichte Schmierung, sowie auch ein Befühlen der Kreuzkopflager mit der Hand während des Betriebes ermöglicht.

Patent-Ansprüche:

1. Kolben und Zylinder für Verbrennungskraftmaschinen, dadurch gekennzeichnet, daß der führende zylindrische Kolben bis zum Pleuelstangengelenk kreuzkopfartig ausgespart ist, so daß bei einer gleichen Aussparung des Zylinderendes das Gelenk in der äußeren Totlage sichtbar zum Vorschein kommt.

2. Kolben nach Anspruch 1, dadurch gekennzeichnet, daß der Arbeitsdruck vom Kolbenboden auf den Gelenkbolzen durch Rippen übertragen wird, die sich in der Schwingungsebene der Pleuelstange an die zylindrische Kolbenwand, in jeder anderen Richtung nur an den Kolbenboden anschließen.

Hierzu 1 Blatt Zeichnungen.

2. Auflage, ausgegeben am 30. November 1909.

UNITED STATES PATENT OFFICE.

LOUIS M. STELLMANN, OF SYRACUSE, NEW YORK, ASSIGNOR TO H. H. FRANKLIN MANUFACTURING COMPANY, OF SYRACUSE, NEW YORK, A CORPORATION OF NEW YORK.

PISTON CONSTRUCTION.

Application filed April 14, 1923. Serial No. 632,743.

To all whom it may concern:

Be it known that I, LOUIS M. STELLMANN, a citizen of the United States, and a resident of Syracuse, in the county of Onondaga and State of New York, have invented a certain new and useful Piston Construction, of which the following is a specification.

This invention relates to pistons more particularly for internal combustion engines, which pistons are formed of a metal as aluminum alloy, having a greater coefficient of expansion than the cylinder walls which are usually of cast iron; and has for its object an expansible piston having a portion of its skirt or sleeve fitting and conforming to the cylinder at all temperatures of the engines and other portions of its sleeve or skirt normally spaced apart from the cylinder walls and movable or expansible outwardly toward the cylinder walls to conform to the curve thereof, as the piston expands under the influence of the heat generated in the operation of the engine, the expansible portions carrying the wrist pin bosses and constituting approximately two-thirds of the cylinder.

The invention consists in the novel features, and in the combinations and constructions hereinafter set forth and claimed.

In describing this invention, reference is had to the accompanying drawings in which like characters designate corresponding parts in all the views.

Figure 1 is a fragmentary vertical sectional view of this piston, the contiguous portion of the cylinder and also the wrist pin and connecting rod and other parts of the engine being also shown, the connecting rod being broken away at one end.

Figure 2 is a sectional view of the piston similar to that shown in Fig. 1, the cylinder and other parts of the engine being omitted.

Figure 3 is a sectional view of the piston taken at a right angle to Fig. 2.

Figure 4 is an elevation of the piston.

Figure 5 is a transverse sectional view through the piston on line 4—4, Fig. 2.

Figure 6 is a diagrammatic view illustrating the position of the piston in the cylinder, the eccentric or expansible portions or walls of the piston being exaggerated to clearly illustrate the operation or expansion of the piston relatively to the cylinder.

Figure 7 is a detail view of the ring for holding the wrist pins from displacement.

This piston comprises a head portion provided with the usual grooves for the piston rings, and a sleeve, the sleeve having diametrically opposite eccentric expansible portions extending in arcs of greater radius than the normal radius or the radius of diametrically opposite concentric portions of the piston arranged between the expansible portions.

The concentric portions are arranged on the bearing or thrust sides of the piston and are of considerably less width than the eccentric portions, and the pin bosses are carried by the eccentric expansible portions.

1 designates the piston having a head 2 provided with the usual grooves 3 for the piston rings 4.

5 is the sleeve of the piston which is connected to the head by diametrically opposite integral portions at 7 and also by internal brackets or webs 8, the connecting portions 7 and webs 8 being located above the pin bosses 9.

The sleeve is also separated from the head by slots 10 located on diametrically opposite sides thereof on opposite sides of the connecting portions 7 and webs 8.

The sleeve 5 is automatically expansible to fit the cylinder and has concentric portions 11 on diametrically opposite sides thereof which slidably fit the bore of the cylinder and other diametrically opposite eccentric portions 12 between arcs of greater radius than the radius of the concentric portions and the center of the arc of each eccentric portion being located at 13° on the opposite side of the longitudinal axis 13 of the piston from that on which the eccentric portion 12 is located.

In the interest of brevity, the piston thus may be considered to be slightly elliptical in general form in cross section although it is not a true ellipse as its ends are concentric with the axis of the piston and the outline of the piston is not a true ellipse.

The concentric portions 11 are arranged on the bearing or thrust sides of the piston

and each constitutes approximately one-sixth of the sleeve, and the wrist pin bosses 9 project inwardly from the intermediate portions of the eccentric sides of the piston, each of which constitute approximately one-third of the sleeve.

The outer faces of the sleeve are slightly tapered toward the lower end of the piston as indicated in Fig. 5.

Preferably, the concentric portions 11 of the piston are formed with lengthwise slots 11ª opening through the lower end of the piston and extending to a point above the axis of the pin bosses.

The piston is shown as provided with peripheral recesses 14 on diametrically opposite sides thereof in the connecting portion 7 in line with the slots 10. These recesses perform no function in the use of the piston but are present for manufacturing purposes for the purpose of facilitating the cutting of the slots 10 by turning operation.

The slots 10 entirely separate the concentric end portions or walls of the sleeve from the head and partly separate portions of the eccentric walls on opposite sides of the connecting neck 7 from the head.

The wrist pin bosses 9 as before stated, are carried by the eccentric or expansible portions on walls 12 of the sleeve and hence move radially during the expansion of such walls, and the wrist pin 15 is slidably or floatingly mounted in the wrist pin bosses and it is also preferably slidingly or floatingly mounted in the bearing 16 of the connecting rod 17.

In order to prevent the wrist pin from sliding into engagement with the cylinder walls and scoring the cylinder, the piston is provided with means for holding the pin from axial displacement beyond the periphery of the piston.

In the illustrated embodiment of my invention, the sleeve is formed with a circumferential groove 18 which extends across the outer ends of the wrist pin bosses, and a retaining ring 19 is seated in the groove and thus prevents outward movement of the wrist pin.

In case the piston pin becomes broken in use the ring 19 holds the fragment thereof from dropping down into the engine base and damaging other parts of the engine.

In operation, the piston is placed in the cylinder with the concentric portions 11 fitting the bore of the cylinder and holding the piston from slapping. As the piston becomes heated, the eccentric portions 12 thereof expand or bow outwardly toward or into continuations of the arcs of the concentric portions 11 and relieve undue tightness between the concentric portions 11 and the cylinder walls.

This piston construction is particularly advantageous in pistons made of aluminum or aluminum alloy or some metal having a greater coefficient of expansion than the cylinder, in that the piston is made to fit the cylinder at all temperatures of the engine, without relying upon resiliency of the metal. Hence, the liability of a resilient metal taking a permanent set is eliminated as in compressible pistons which sooner or later take a permanent set, and become sloppy.

What I claim is.

1. A piston for internal combustion engines comprising a head and a sleeve, the sleeve being slightly elliptical in general form in cross section, and the sleeve being formed with longitudinal slots arranged in the end walls of the elliptical form, the sleeve having pin bosses extending inwardly from the long walls of the elliptical form along a short diameter of the elliptical form and each of the long walls of the ellipse being approximately one third of the sleeve, substantially as and for the purpose specified.

2. A piston for internal combustion engines comprising a head, and a sleeve, the sleeve having diametrically opposite portions of its wall of equal width concentric with the axis of the piston and other diametrically opposite eccentric expansible portions between the concentric portions having their outer faces of greater radius than the concentric portions and located within continuations of the arcs of the outer faces of the concentric portions, each eccentric portion constituting approximately one-third of the sleeve, the concentric portions being formed with lengthwise slots opening through the lower end of the sleeve, and pin bosses projecting inwardly from the eccentric portions substantially midway between the concentric portions, substantially as and for the purpose specified.

3. A piston for internal combustion engines, comprising a head, and a sleeve, the sleeve having diametrically opposite portions of its wall of equal width concentric with the axis of the piston and other diametrically opposite eccentric expansible portions between the concentric portions, the eccentric portions having their outer faces of greater radius than the concentric portions and located within continuations of the arcs of the outer faces of the concentric portions, each eccentric portion constituting approximately one-third of the sleeve, the concentric portions being formed with lengthwise slots opening through the lower end of the sleeve, and pin bosses projecting inwardly from the eccentric portions substantially midway between the concentric portions, the slots being located in the portion of the sleeve at the end of the ellipse approximately midway between the pin bosses.

4. A piston for internal combustion en-

gines having a head and a sleeve, transverse slots in diametrically opposite sides of the piston separating the opposite side portions of the head from the sleeve, whereby the head is connected to the sleeve between the ends of the slots, the sleeve being slightly elliptical in general form in cross section, the ends of the elliptical form being concentric with the axis of the piston, and wrist pin bosses projecting from the portions of the sleeve joined to the head between the ends of the slots, the axis of said pin bosses extending along the short diameter of the elliptical form, substantially as and for the purpose specified.

5. A piston for internal combustion engines having a head and a sleeve, transverse slots in diametrically opposite sides of the piston separating the opposite side portions of the head from the sleeve, whereby the head is connected to the sleeve between the ends of the slots, the sleeve being slightly elliptical in general form in cross section, the ends of the elliptical form being concentric with the axis of the piston, and wrist pin bosses projecting from the portions of the sleeve joined to the head between the ends of the slots, the axis of said pin bosses extending along the short diameter of the elliptical form, the sleeves being also formed with lengthwise slots midway between the ends of the transverse slots, substantially as and for the purpose set forth.

In testimony whereof, I have hereunto signed my name, at Syracuse, in the county of Onondaga, and State of New York, this _____day of February, 1923.

PISTON

Application filed February 16, 1929. Serial No. 340,137.

This invention relates to pistons, more particularly to pistons for use in internal combustion engines.

The piston is the movable member within the cylinder of the engine and in the internal combustion engine the head portion of the piston is subjected to direct contact with the high heat temperature caused by the frequent explosions of the ignited gases. The piston unlike the cylinder is not provided with means for cooling or controlling its temperature and the head portion thereof, quite frequently attains a temperature of 750 to 1000 degrees Fahrenheit. This heat temperature causes the piston to expand and this expansion of the piston is greater than that of the cylinder in which it operates, consequently, the piston must be smaller in diameter than the diameter of the bore of the cylinder to admit of its expansion allowing the piston movable action in the cylinder free from binding, which would otherwise occur were the piston made to a size to fit the cylinder when cold.

The head portion of the piston receives its heat by direct contact, the body portion by transmission, the head portion therefore must be made smaller than that of the body portion.

The piston as thus made would yet be unsuccessful operatively if it were not for the use of split metallic packing rings employed solely to pack the space between the piston and the cylinder and ordinarily positioned in grooves cut in the head section of the piston. The piston as ordinarily made with grooves and packing rings therein lack the requisite features of a more desirable construction in that the looseness of the piston tends to wear the cylinder out of cylindrical truth. The delicate structure of the rings causes them to lose their tension due to the high heat temperature to which they are subjected, consequently, failing in their function to properly pack the cylinder against leakage, causing loss of compression, also permitting the lubricating oil not only to enter the combustion chamber resulting in irregular ignition, but also permitting lubricating oil to secrete beneath the rings between their inner surface and the bottom of the grooves resulting in the formation of carbon therebetween causing a solid mass to form which forces the rings against the cylinder wall and not infrequently results in scoring the cylinder.

The present invention is designed to overcome all of the objections above described and as inhering in the prior art construction, by constructing the piston in such a novel way as will eliminate the objections referred to and to such ends the invention comprises a piston having a head and body free from ring grooves. The head and body united by suitable ribs constructed in a manner providing a yielding capacity. The body of the piston being parted from the head and a slit or series of slits cut through the body and terminating at the parting between the head and the body. Sealing means for the head and body and positioned in the space therebetween.

The object therefore, of the present invention is to construct a piston free from rings and ring grooves, a piston made the reverse of present practice in that it is initially larger in diameter than the diameter of the bore of the cylinder, a piston characterized by the feature of being expansible and contractable automatically under the varying condition to which it is subjected, a piston enabled, by its construction, to fit the cylinder snugly at all times.

For the purpose of enabling others to clearly understand, make, and operate this invention the following description is given supplemented by the accompanying drawings, in which:

Figure 1 is a vertical elevation partly in section as of the line X—X Figure 3.

Figure 2 is a vertical side elevation viewed in the direction indicated by the arrow Figure 3.

Figure 3 is a plan view.

Figure 4 is a plan view in section of Figure 2 as of the line Z—Z Figure 2.

Figure 5 is a fragmentary view in elevation of a member part of this construction.

Figure 6 is a side view of Figure 5.

In the drawings like numerals of reference indicate corresponding parts throughout the several figures. The numeral 10 designates

the head portion of this construction, 11 the body portion, the portions 10 and 11 are united integrally by internal ribs 12 a portion of which has an intersection integrally with the head 10 and the other portion extends radially and has its intersection with the body 11. The ribs 12 have bosses 13 formed thereto which are drilled or bored to receive a pin 14 which connects the piston with the other operable parts of the engine. The ribs 12, are especially constructed to support and unite the head 10 and the body 11 and also to support bosses 13, experience has proven this construction to have an advantage in that of preventing distortion of the body 11, due to the stresses to which a piston is subjected by reason of the angularity of the different positions of the connecting rod while the engine is in operation. The ribs 12, in this case carry the parts connecting the piston with the engine more yieldingly than would be the case were the bosses 13 directly supported by the body 11, resulting in a more smoothly running engine having less vibration. The radially extending portion of the ribs 12, is not connected with the head 10, there being a space 15, between the under side of the head 10, and the upper end of the rib 12, this permits the U shaped cross section of the ribs 12, to have a yielding effect when in operation both in lateral and circular direction, that is to say the body 11, will yield diametrally and circularly when subjected to pressure from the sides.

In the manufacture of this improved construction of piston the head 10, the body 11, with ribs 12, and bosses 13, are cast to form from cast iron or suitable alloy composition metal the hole in the bosses 13, for the connecting pin 14, is cored to approximately the size to which it is finally to be finished the cored hole extending through the body 11, in alignment with the hole in the bosses 13, the space 15, between the under side of the head 10, and the top of the radial portion of the ribs 12, is also cored at the time of casting the entire body. The external surface of the head 10, and the body 11, is subjected to a machining process for the purpose of dressing the head 10, and to size the body 11, so that it will properly fit into the cylinder. At this point a change is made just the reverse of that which is the practice in sizing the conventional type of pistons for instead of machining the body of the piston smaller than the bore of the cylinder into which it is to operate, as is the common practice, my improved piston is machined to a size approximately of .005 of an inch larger than the bore of the cylinder.

When the head 10, and body 11, are thus machined to size the head 10, and the body 11, are then parted from each other at 16, by using a very thin parting tool and cutting through the body 11, adjacent the head 10, a very thin opening 16, is effected parting the head 10, from the body 11.

The next operation is to cut very thin slits 17, adjacent the intersection of the radial ribs 12, with the body 11, cutting through the body 11, and longitudinal of its axis terminating at the parting 16, just beneath the head 10. The resulting consequences of this operation renders the body 11, resilient, that is, the body will yield radially and circularly so that it can be placed tensionally in a cylinder having a bore less in diameter than that to which the piston was sized.

The piston thus made will fit the cylinder very properly but it would not prevent the compression leakage or the escapage of gases through the parting at 16, between the edge of the head 10, and the edge of the body 11. To effect a seal at the parting 16, a thin sheet metal ring 18, Figures 5, and 6, is inserted into this space, this ring is split at 19, with lapping portions 20, one above the other for a distance of about 1/8 of an inch.

The function of the split metal ring 18, is to to seal the opening 16.

From the foregoing description it is clear that this construction fulfills the purpose for which it is intended. The body 11, being resiliently expansible and contractable renders the use of split metal piston rings unnecessary, doing away entirely with grooves cut in the piston for the rings, eliminating this source of danger to the cylinder by reason of the accummulation of carbon therein which tends to build up beneath the rings forcing them against the cylinder walls causing the scoring of the cylinder.

It is finally to be noted that the body portion 11, is turned to a size over its full length to an amount approximately .005 of an inch larger than the bore of the cylinder into which it is to operate. The effect of splitting the body 11, at diametrically opposite position as at 17, and assisted by the U shaped portion of ribs 12, provides the condition for uniform circular expansion and contraction of the body 11, effecting a uniform tensional fit in the cylinder.

It is understood that minor changes may be made in the size, form and shape of this structure without departing from the spirit of this invention within the scope of the appended claims.

Having thus described the invention what I claim and desire to secure by Letters Patent is:

1. A piston having its head and body integrally connected by means of internal yielding ribs, a parting between the head and body, slits cut through said body, sealing means for said head and body, and means provided on said internal ribs adapted to form engaging connection with operable parts for said piston.

2. A piston having internal yielding ribs

integrally connecting the head and body portions of said piston, said head and body portion being parted from each other, sealing means positioned in said parting between the head and body, slits cut through the body portion of said piston providing resiliency for said body and means provided on said internal ribs adapted to form engaging connection with operable parts for said piston.

2. In a piston of the class described, a cup-like head comprising a pressure receiving end and a wall portion, a skirt circumferentially disconnected from the wall portion of the head and divided from end to end, and skirt carriers connecting said skirt to the pressure receiving end, said skirt carriers being disconnected from the wall portion of the head and susceptible of being slightly flexed radially.

4. A piston comprising a head, a skirt having resilient sections separated from said head by a slit extending continuously around the piston, and means for yieldingly connecting said skirt sections with said head.

5. A piston having a skirt at least a portion of which is separated from the head by a slot in which a piston ring is adapted to be mounted, said portion of the skirt being supported from the head by a flexible interior rib member.

In confirmation hereof I hereto attach my signature.

UNITED STATES PATENT OFFICE.

LAURENCE HENRY POMEROY, OF CLEVELAND, OHIO, ASSIGNOR TO THE ALUMINUM COMPANY OF AMERICA, OF PITTSBURGH, PENNSYLVANIA, A CORPORATION OF PENNSYLVANIA.

PISTON.

Application filed September 4, 1919. Serial No. 321,696.

To all whom it may concern:

Be it known that I, LAURENCE HENRY POMEROY, a subject of the King of Great Britain and Ireland, residing at Cleveland, in the county of Cuyahoga and State of Ohio, have invented certain new and useful Improvements in Pistons, of which the following is a specification, reference being had therein to the accompanying drawings.

This invention relates more particularly to pistons adapted for use in internal combustion engines or under conditions in which the piston is subjected to considerable heat.

As is well known, the clearance with which the pistons of internal combustion engines are fitted is determined in a large measure by the difference in thermal expansion of the piston and the cylinder wall. This difference in thermal expansion is due to the fact that the working temperature of the piston is somewhat higher than that of the cylinder wall and, in some cases, to the use of different piston and cylinder materials having different co-efficients of thermal conductivity and expansion. Thus in the case of pistons of aluminum or magnesium alloys working in iron cylinders the co-efficient of expansion of the aluminum or the magnesium being higher than that of iron, it is necessary to give the pistons a larger clearance than is required for iron pistons working in iron cylinders. This larger clearance, with pistons as heretofore constructed, results in piston slap or knock when the engine is running cold at starting and, in fact, whenever the thermal conditions of the cylinder and piston are such that the large clearance required to obviate seizure at high temperatures exists between the piston and cylinder wall.

One object of the present invention is the provision of a piston of aluminum alloy or other light weight metal, that will operate without piston slap.

Another object of the invention is the provision of a piston so constructed that it can be given a small working clearance independent of differences of thermal expansion of the piston and the cylinder wall.

A further object of the invention is the provision of a piston capable of adjusting itself to the cylinder as wear occurs of the piston or cylinder or both.

Another object of the invention is the provision of a piston that will wear evenly from end to end.

Another object of the invention is the attainment of the ends above mentioned in an integrally cast piston.

These and other more or less incidental objects, are attained in the manner set forth in the following description of the preferred form of construction.

In the drawings,

Fig. 1 is a view partly in side elevation and partly in section of a piston embodying the invention.

Fig. 2 is a section on the line 2—2, Fig. 1.

My improvements are applicable to pistons of various forms of construction but in the drawings, for purposes of explanation, I have shown the invention applied to the slipper type of piston shown in United States Letters Patent No. 1,294,833, to H. R. Ricardo.

Referring in detail to the construction illustrated, the piston has a head section 1 comprising a crown 1^a and a side wall 1^b which is formed with grooves to receive suitable packing rings 2, 2. The guide section of the piston comprises diametrically opposite cylinder-engaging slippers 3 and 4, a pair of wrist pin bosses 5, 5 arranged between the slippers, and a pair of webs 6, 6 which join the slippers and bosses together and extend upward and merge with the crown and side wall of the head section of the piston, the entire piston being cast in one. Aside from the rings 2, 2, only the slipper parts 3, 4 are designed to contact with the cylinder wall, the piston differing in this respect from the prior trunk or skirted pistons which have a guide part in the form of a continuous sleeve or skirt that contacts with the cylinder wall on all sides.

In the construction shown the slippers 3 and 4 are made unequal in size, the larger slipper 3 being designed to take the angular thrust or reaction of the connecting rod during the explosion stroke of an internal combustion engine, while the smaller slipper 4 is designed to take the angular thrust during the compression stroke of the engine. The above described features of the construction are characteristic of the Ricardo slipper piston.

My improvements constituting the present invention are effected by forming the piston

so that some part of the guide structure is capable of resiliently yielding at points between the cylinder-engaging surfaces on opposite sides of the wrist pin to compensate for differences in thermal expansion of the piston and cylinder and I prefer to make the guide structure so that it will yield more readily between the wrist pin bosses and the cylinder-engaging surface which takes the thrust during the compression stroke of the piston, than between said bosses and the cylinder-engaging surface which takes the thrust during the explosion stroke. The means, when applied to the slipper type of piston illustrated, that the major yield shall occur between the pin bosses 5 and the cylinder-engaging surface of the slipper 4, and in the construction illustrated I have made provision for a resilient yielding in the webs 6, 6 which permits movement of the slipper 4 toward and from the slipper 3. To secure relative movement of the slipper 4 in parallelism, the web structure is formed to yield in two separated sections, which are preferably adjacent the respective ends of the slipper.

In the construction illustrated this is accomplished by forming each of the webs 6 with two parallel slots 7 and 8, the slot 7 being open at its upper end and closed at its lower end, while the slot 8 is closed at its upper end and open at its lower end. The slots 7 and 8 terminate at their closed ends with enlarged cylindrical aperatures 7^a and 8^a, respectively. Thus it will be seen that the slipper 4 is supported by elongated strips or sections 9 of the webs 6, and each of the sections 9 has reduced and weakened cross sections at 9^a and 9^b, so that any yielding of the web structure is localized at these points 9^a and 9^b.

My improved form of construction can be applied to pistons cast of any suitable metal but it is especially useful in connection with pistons of aluminum alloy or other light metals having high coefficients of thermal expansion in comparison with iron as it makes it possible to fit such pistons with as small a clearance as is possible with iron pistons of prior forms of construction. Iron pistons of internal combustion engines fitted with a clearance of 0.00075 inch per inch of piston diameter are found to operate with substantial freedom from piston slap, and pistons of aluminum alloy made in accordance with my invention can readily be operated with similar clearances. Indeed a still smaller clearance is made possible by my invention.

In the operation of aluminum pistons of my improved form of construction, asuming a cold working clearance of 0.00075 inch per inch of piston diameter, or less, to insure freedom from piston slap when starting, as the engine heats up the excess expansion of the piston as compared with the surrounding cylinder wall of iron will reduce this clearance; but as the clearance approaches zero the construction of the piston webs permits them to yield so as to compensate for the excess expansion of the guide section of the piston and all danger of the seizing of the piston is obviated. When the engine is stopped and the parts again cool down the resilience of the web structure causes it to return to normal form and a suitable small clearance between the piston guide and the cylinder wall is maintained. It will, of course, be understood that the piston head proper is given a smaller diameter than the guide and does not function as a guide. As has been explained the yielding of the web structure occurs at the points 9^a and 9^b adjacent to the upper and lower parts of the slipper 4 so that the slipper 4 is maintained in parallelism with the axis of the cylinder. This insures uniform contact and wear throughout the full length of the slippers. As only a relatively light thrust, incident to the compression of the combustible charge in the engine cylinder, is applied to the smaller slipper 4, the resilient web structure is able to sustain the stresses to which it is subjected, it being possible, of course, to make the guide structure between the wrist pin bosses and the cylinder-engaging surface of the slipper 3 adequately strong to sustain the heavy thrust due to the explosion of the engine charge. This is an important feature of my invention since in most, if not all, cases it is found that a construction that is capable of yielding sufficiently to adequately compensate for differences of expansion, will fail if subjected to the angular thrust of the connecting rod in the working or explosion stroke of the piston.

It is to be understood that the dimensions of the yieldable web sections, as at 9^a and 9^b, will be determined by the diameter of the piston and other factors such as the compression pressure and the maximum engine speed, the requirements being that the web sections 9^a and 9^b yield sufficiently to prevent seizing under the pressure set up between the cylinder wall and the piston due to thermal expansion, but do not yield too much under the thrust due to compression and inertia, and that they yield, whether under said expansion pressure or under the thrust due to compression and inertia, in a manner to maintain the slipper 4 parallel to the piston axis.

It will be seen that the amount of yielding in the piston webs will be determined, for the most part, by the cold working clearance of the piston. By making this clearance sufficiently small the clearance will be rendered nil when the parts heat up in operation and a resilient pressure of the slippers against the cylinder wall will be secured.

Under these conditions the resiliency of the piston web structure will insure the maintenance of close working contacts between the slippers and the cylinder wall as wear of these parts occurs and, as above noted, the movement of the slipper 4 parallel to the piston axis will insure a uniform contact and wear of the parts throughout the full lengths of the slippers. In other words, my resiliently yieldable piston structure, by compensating for excess expansion of the piston, secures an automatic adjustment of the piston to the cylinder as wear occurs.

My improvements, while applicable in their broader aspects to other types of pistons, are especially applicable to the slipper type of piston illustrated and it will be seen that this is due, in part at least, to the fact that the yieldable web parts have no contact with the cylinder wall and thus are free, in so far as the cylinder is concerned, to accommodate themselves to the movement of those parts which do engage the cylinder.

It is obvious that my invention can be embodied in various forms of construction and it is to be understood that it is not limited to the particular construction illustrated in the drawing except as specified in the following claims.

What I claim is:

1. An integrally cast piston comprising a head, diametrically opposite guide slippers, a pair of wrist pin bosses between the slippers and a pair of webs joining the head, slippers and bosses together, said webs being formed at points between the bosses and one of the slippers so as to resiliently yield and permit movement of said slipper toward and from the other slipper.

2. An integrally cast piston comprising a head, diametrically opposite guide slippers, a pair of wrist pin bosses between the slippers and a pair of webs joining the head, slippers and bosses together, said webs being formed at points between the bosses and one of the slippers so as to resiliently yield and permit movement of said slipper in parallelism toward and from the other slipper.

3. An integrally cast piston comprising a head, diametrically opposite guide slippers, a pair of wrist pin bosses between the slippers and a pair of webs joining the head, slippers and bosses together, said webs being formed between the bosses and one of the slippers each with a pair of parallel slots of which one is open at its end adjacent the piston head and the other is open at its end away from said head.

4. A piston comprising a head and a guide structure connected thereto having wrist pin bosses and cylinder-engaging surfaces on opposite sides of the bosses, the guide structure being adapted to resiliently yield to a greater extent between the pin bosses and one of said cylinder-engaging surfaces than between the said pin bosses and the other cylinder-engaging surface.

5. A piston having a head and a guide structure connected thereto, said guide structure comprising diametrically opposite parts having cylinder-engaging surfaces, wrist pin bosses, between said opposite parts, and means for joining said bosses and cylinder-engaging parts, said joining means being arranged not to engage the cylinder and the guide structure being adapted to resiliently yield to a greater extent between the pin bosses and one of said cylinder-engaging surfaces than between the said pin bosses and the other cylinder-engaging surface.

6. A piston having a head and a guide structure connected thereto, said guide structure comprising diametrically opposite slippers having cylinder-engaging surfaces, wrist pin bosses between the slippers and means joining said bosses and slippers together, the guide structure being adapted to resiliently yield to a greater extent at points between the pin bosses and the cylinder-engaging surfaces of one slipper than between the said pin bosses and the cylinder-engaging surfaces of the other slipper.

7. A piston having a head and a guide structure connected thereto which comprises diametrically opposite cylinder-engaging parts, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable to a greater extent on one side of the wrist pin bosses than on the other side thereof.

8. A piston having a head and a guide structure connected thereto which comprises diametrically opposite slippers, wrist pin bosses between the slippers and means joining said bosses and slippers together, the said joining means being resiliently yieldable to a greater extent on one side of the wrist pin bosses than on the other side thereof.

9. A piston as claimed in claim 4 characterized by being integrally cast.

10. A piston as claimed in claim 5 characterized by being integrally cast.

11. A piston as claimed in claim 6 characterized by being integrally cast.

12. A piston as claimed in claim 7 characterized by being integrally cast.

13. A piston as claimed in claim 8 characterized by being integrally cast.

In testimony whereof, I hereunto affix my signature.

LAURENCE HENRY POMEROY.

Exception Nos. 41 and 42 1211
Exception No. 43 1212
Exception Nos. 44 and 45 ..... 121.
Exception Nos. 46 and 47 1214
Exception Nos. 48, 49 and 50 1215
Exception Nos. 51, 52 and 53 1216
Exception No. 54 1217
Exception No. 55 1218
Exception Nos. 56, 57 and 58 1219
Exception Nos. 59, 60 and 61 1220
Exception No. 62 and Nos. 63 to 97 Inclusive 1221
Exception Nos. 98, 99, 100 and 101 1225
Exception Nos. 102, 103 and 104 1226
Exception Nos. 105, 106, 107 and 108 1227
Exception Nos. 109, 110 and 111 1228
Memorandum on Exceptions to Master's Report 1229
Final Decree 1230
Petition for Appeal 1231
Order Allowing Appeal 1231
Assignment of Errors 1232
Group A—Assignment of Errors relating to Validity of the Gulick Patent No. 1,815,733 1232
Group B—Assignment of Errors relating to Infringement of the Gulick Patent in Suit 1240
Group C—Assignment of Errors relating to Validity of the Jardine Patent No. 1,763,522 1241

Group D—Assignment of Errors relating to Infringement of Jardine Patent in Suit 1242

Group E—Assignment of Errors relating to Validity of Maynard Patent No. 1,655,968 1243

Group F—Assignment of Errors relating to Infringement of Maynard Patent in Suit 1245

Group G—Assignment of Errors relating to Validity of Mooers Patent No. 1,402,309 1246

Group H—Assignment of Errors relating to Infringement of Mooers Patent in Suit 1248

Group I—Assignment of Errors relating to Validity of Schmiedeknecht Patent No. 1,256,265 1248

Group J—Assignment of Errors relating to Infringement of the Schmiedeknecht Patent in Suit 1249

Group K—General Assignment of Errors 1250

Citation 1251

Bond on Appeal 1253

Order Granting Stipulation for Filing Narrative Form Testimony in One Cause with Reference Thereto in Each of Other Two Causes 1255

Order Extending Time to Nov. 24, 1934 for Lodging Narrative Statement of Evidence and Filing Praecipe and to Dec. 16, 1934 for Filing Transcript of Record in U. S. Circuit Court of Appeals 1255

Order Extending Time to Dec. 14, 1934 for Lodging Narrative Statement of Evidence and Filing Praecipe and to Dec. 26, 1934 for Filing Transcript of Record in U. S. Circuit Court of Appeals 1256

Stipulation Extending Time to Dec. 21, 1934, for Filing Praecipe and Lodging Narrative Statement of Evidence 1257

Order Granting Stipulation Extending Time to Dec. 21, 1934 for Filing Praecipe and Lodging Narrative Statement of Evidence 1257

Order Extending Time to Dec. 31, 1934 for Lodging Narrative Form of Testimony and Filing Praecipe and to Jan. 25, 1935, for Filing Transcript of Record in U. S. Circuit Court of Appeals 1258

Order Extending Time to Jan. 14, 1935 for Lodging Narrative Form of Testimony and Filing Praecipe 1258

Order Extending Time to Jan. 28, 1935 for Lodging Narrative Form of Testimony and Filing Praecipe and to Feb. 23, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1259

Order Extending Time to Feb. 18, 1935 for Lodging the Narrative Form of Testimony and Filing Praecipe..... 1260

Order Extending Time to Feb. 25, 1935 for Lodging Narrative Form of Testimony and Filing Praecipe and to March 25, 1935, for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1261

Order Extending Time to March 15, 1935 for Filing Praecipe 1261

Order Extending Time to April 15, 1935 for Filing Praecipe and to April 25, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1262

Order Extending Time to May 6, 1935 for Filing Praecipe and to May 16, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1263

Order Extending Time to June 15, 1935 for Filing Transcript of Record in U. S. Circuit Court of Appeals..... 1263

Order Extending Time to August 15, 1935 for Filing Transcript of Record in United States Circuit Court of Appeals..... 1264

Order Extending Time to August 31, 1935 for Filing Transcript of Record in United States Circuit Court of Appeals..... 1265

Order Extending Time to Sept. 30, 1935 for Filing Transcript of Record in United States Circuit Court of Appeals..... 1265

Stipulation that Appeals in Causes Nos. 4045, 4046 and 4047 be Consolidated in One Printed Transcript of Record, That Exhibits Used Therein may be Used in Each of Said Causes and That Repetition of Similar Pleadings in Each be Eliminated..... 1266

Order Consolidating Appeals in One Printed Transcript of Record, That Exhibits Used Therein may be Used in Each of Said Causes, and Further Ordering Elimination of Repetition of Similar Pleadings in Each Cause..... 1267

Stipulation Re Digest of Exhibits..... 1267

Order Granting Stipulation Re Digest of Exhibits..... 1268

Praecipe 1269

Defendants' Motion for Leave to Add to the Record in the Above-Entitled Case Defendants' Counter Praecipe and Certain Letters 1273

Order Denying Motion of Defendants for Leave to Add to Record Defendants' Counter Praecipe and Certain Letters 1277

Petition to Supply Last Eight Pages Missing from Plaintiffs' Exhibit 13 in the Above Cause on Appeal 1278

Order Granting Leave to Supply Last Eight Pages of Plaintiffs' Exhibit No. 13 1278

Defendants' Counter Praecipe 1279

Order Settling Contents of Record 1280

Order for Withdrawal of Exhibits 1281

Stipulation Re Certification of Record 1281

VOLUME III.

PLAINTIFFS' EXHIBITS.

(*W* in last column signifies *Withdrawn or Omitted*)

Nos.		Offered Vol: I	Printed Vol. III
1.	Piston Manufactured by Sterling Products Corporation and referred to in Answer	51	W
2.	U. S. Patent No. 1,815,733, July 21, 1931, to E. J. Gulick (Patent in Suit).....	51	1283
3.	U. S. Patent No. 1,763,523, June 10, 1930, to F. Jardine (Patent in Suit).....	51	1291
4.	U. S. Patent No. 1,655,968, Jan. 10, 1928, to H. E. Maynard (Patent in Suit)	51	1299
5.	U. S. Patent No. 1,256,265, Feb. 12, 1918, to V. E. Schmiedeknecht (Patent in Suit)	51	1305
6.	U. S. Patent No. 1,402,309, Jan. 3, 1922, to L. P. Moores (Patent in Suit).....	51	1309

Stipulated Digest of Assignments of Patents in Suit (Offering of Assignments omitted from Narrative):

Gulick Patent No. 1,815,733

2-A.	Edward J. Gulick to Packard Motor Car Co.	51	1331

Nos.		Offered Vol. I	Printed Vol. III
2-B.	Packard Motor Car Co. to The Cleveland Trust Co.	51	1321
	Jardine Patent No. 1,763,523		
3-A.	Frank Jardine to The Aluminum Castings Co.	51	1321
3-B.	The Aluminum Castings Co. to Aluminum Manufactures, Inc.	51	1321
3-C.	Aluminum Manufactures, Inc. to Aluminum Co. of America	51	1321
3-D.	Aluminum Co. of America to The Cleveland Trust Co.	51	1322
	Maynard Patent No. 1,655,968		
4-A.	Howard E. Maynard to Chrysler Corporation	51	1322
4-B.	Chrysler Corporation to Aluminum Manufactures, Inc.	51	1322
4-C.	Aluminum Manufactures, Inc. to Aluminum Co. of America	51	1322
4-D.	Aluminum Co. of America to The Cleveland Trust Company	51	1322
	Schmiedeknecht Patent No. 1,256,265		
5-A.	Victor E. Schmiedeknecht to Frank J. Kent	51	1323
5-B.	Warranty and Guaranty by Victor E. Schmiedeknecht	51	1323
5-C.	Frank J. Kent to Bohn Aluminum and Brass Corp.	51	1323
5-D.	Bohn Aluminum & Brass Corp. to The Cleveland Trust Co.	51	1323
7.	Instruction Sheet to Purchasers of Exhibit No. 1	52	1325
8.	Ray Day Piston	53	W

Nos.		Offered Vol. I	*Printed Vol. III
9.	Ray Day Piston	53	W
10.	Letter, March 19, 1932 to American Gear Co. from Aberdeen Motor Supply Co. (Formal Offer not included in Narrative)	...	W
10A.	Advertisement (Discussed, 53)	...	W
11.	Circular Letter of Sterling Products Corporation (Formal Offer not included in Narrative)	...	1327
12.	Poster displayed by Defendants	53	W
13.	Tabulation as to Sales Produced by Whitney	57	1328
14.	Large Drawing of Internal Combustion Engine	61	W
15.	Drawing of Cross Section of Cylinder and Piston Wall	67	1333
16.	Drawing of Cross Section of Cylinder and Piston Wall (Magnified)	67	1335
17.	Piston Manufactured by Plaintiff's Licensees and duplicated by Sterling Products Corp.	80	W
18.	Letter, March 24, 1932, in Reply to Exhibit No. 10 (Formal Offer not included in Narrative)	...	W
19.	Letter of Mr. Bruninga to F. E. Rowe (Formal Offer not included in Narrative)	...	W
20.	Gulick Piston	156	W
21.	Blueprint D-2376X of Defendants' 3-N Exhibit	190	1337

* In the case of Exhibits which were formally offered on pages of the Original Transcript not included in the Narrative, reference to them is made by the use of the words as "Discussed," "Identified" or "Marked for Identification" in parenthetical brackets instead of by the use of figures in the "Offered" Column of this Index.

Nos.		Offered Vol. I	Printed Vol. III
22.	Blueprint D-2460X, of Defendants', 3-M Exhibit	190	1339
23.	Large Drawing of Ray Day Pistons	190	W
24.	Double-Walled Aluminum Piston	258	W
25.	Consent Decree, Simmons Case	264	1341
26.	Conveyance, Declaration of Trust and Agreement between L. P. Mooers and George B. Pitts and The Cleveland Trust Co., dated March 7, 1922	265	1345
27.	Copy of Letter, Jan. 23, 1933, The Cleveland Trust Co. to Chrysler Corporation (Formal Offer not included in Narrative)	...	W

Nos.		Offered Vol. II	Printed Vol. III
28.	Bill of Sale, Amplex to Gulick	608, 617	1358
29.	Sketch by Randall of Gulick Piston	617	1359
30.	Series of Blueprints of Gulick Motor	617	W
31.	Cross Section Drawing Gulick Sleeve Valve Motor	617	1361
32.	Detail of Piston of Preceding Exhibit	617	1363
33.	Sketch, Gulick Piston (P.X. 62)	770	W
34.	Ebbs Physical Piston (Marked for identification, 565)	...	W
35-A.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1365
35-B.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1367
35-C.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1369
35-D.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1371
35-E.	Sketch by Winchester of Gulick Piston (Marked for identification, 638)	...	1373
36.	Gulick 1911 Sketch (Identified, 702)	780	1375
37.	Gulick Written Description (Identified, 702)	780	1377

Nos.		Offered Vol. I	Printed Vol. III
38a.	Supplemental Contract between The Cleveland Trust Co. and Aluminum Co. of America, dated April 26, 1924.....	282	1378
38b.	License Agreement between The Cleveland Trust Co. and Aluminum Co. of America	282	1381
	Exhibit A to License Agreement (Agreement between The Cleveland Trust Co. and Nordyke & Marmon Co., dated April 23, 1920).....	282	1393
38c.	License Agreement between Walker M. Levett Co., W. M. Levett Corp., Walker M. Levett and The Cleveland Trust Co., dated April 11, 1924.....	282	1397
38d.	License Agreement between The National Piston Co., Gustave E. Franquist, James E. Diamond and The Cleveland Trust Co., dated April 11, 1924.....	282	1403
38e.	License Agreement between Kant-Skore Piston Co. and The Cleveland Trust Co., dated April 11, 1924.....	282	1408
39a.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Sept. 19, 1927	282	1412
39b.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Oct. 12, 1927	283	1413
39c.	License Agreement between The Cleveland Trust Co. and Bohn Aluminum & Brass Corp., dated Sept. 15, 1927, with Lists A and B attached.....	283	1414
	List A	283	1426
	List B	283	1427
39d.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Sept. 19, 1927	283	1428

Nos.		Offered Vol. I	Printed Vol. III
39e.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated April 26, 1928	283	1429
39f.	License Agreement between The Cleveland Trust Co. and Bohn Aluminum & Brass Corp., dated April 25, 1928	283	1430
39g.	Letter from Aluminum Co. of America to The Cleveland Trust Co., dated Dec. 24, 1929	283	1434
40.	Agreement between Bohn Aluminum & Brass Corporation and The Cleveland Trust Co., dated Oct. 12, 1927 under Schmiedeknecht Patent No. 1,256,265	287	1435
		Offered Vol. II	Printed Vol. III
42a.	Franklin Weekly Engineering Report for the Week Ending Oct. 5, 1918	658, 663	1438
42b.	Franklin Weekly Engineering Report for the Week Ending July 20, 1918	658, 663	1439
42c.	Franklin Weekly Engineering Report for the Week Ending May 3, 1919	658, 663	1440
43.	Photostat of Drawing P-2912	663	W
44.	Letter to E. C. Long from Franklin Mfg. Co., dated May 9, 1918	663	1445
45.	Letter to E. C. Long from Franklin Automobile Co., dated April 17, 1918	663	1446
44.*	Gulick Sketch Made in Court of First Sketch of 1911 (Identified, 701)	730	1447
45.*	Blueprint of Standard Excelsior Motor (Identified, 704)	730	1449
46.	Blueprint P-2912	693	1451
47.	Piston Used by Excelsior Motor (Identified, 705)	730	W
48.	Reproduction of Piston as Used by Excelsior (Identified, 705)	730	W
49.	Excelsior Motorcycle Piston (Identified, 709)	730	W

Nos.		Offered Vol. II	Printed Vol. III
50.	Blueprint of Excelsior Motorcycle Piston (Identified, 709)	730	1453
51.	Gulick Sketch Made in Court of Piston made by Casting of Rockhoff	716	1455
52.	Letter, Packard Motor Car Co. to E. J. Gulick, dated Mar. 27, 1916	721	1457
53.	Letter, E. J. Gulick to Packard Motor Car Co., dated April 1, 1916	722	1459
54.	Letter, E. J. Gulick to Packard Motor Car Co., dated Dec. 4, 1916	722	1460
55.	Letter, Packard Motor Car Co. to E. J. Gulick, dated Feb. 28, 1917	722	1461
56.	Letter, E. J. Gulick to Packard Motor Car Co., dated May 18, 1917	722	1462
57.	Letter, E. J. Gulick to Packard Motor Car Co., dated Mar. 26, 1917	724	1463
58.	Core-box Used by Excelsior Motor & Mfg. Co.	724	W
59.	Pattern Used by Excelsior Motor & Mfg. Co.	724	W
60.	Picture of Renault Type Car Driven by Gulick in 1911	727	1465
61.	Letter in re Above, dated Dec. 1, 1927, in re Loss of Original	727	W
62.	Gulick Exhibit No. 11 in Interferences 49,569, 49,570 and 49,571	770	1467
63.	Letter, Ray Stewart Gehr to E. J. Gulick, dated Aug. 22, 1923 (Identified, 811)	...	1469
64.	Letter, E. J. Gulick to Ray Stewart Gehr, dated Aug. 23, 1923 (Identified, 811)	...	1471
65.	Gulick Deposition on Interferences 49,569, 49,570 and 49,571, pages 40 to 103, inclusive	827	1472
	Index of Exhibits showing both Interference and Transcript Numbers of Exhibits		1472

Nos.		Offered Vol. II	Printed Vol. III
	Edward J. Gulick:		
	Direct Examination		1475
	Cross Examination		1501
	Re-Direct Examination		1518
	Re-Cross Examination		1526
	Re-Direct Examination		1530
	Re-Cross Examination		1531
66.	Patent Office List of Applications of Elmer C. Long filed in Patent Office.....	830	1532
67.	Record of Long Interference No. 45,569	831	W
67-A.	Record of Interference of Exhibit No. 65 (pp. 104 to 281) not received	831	W
67-B.	Opinion of Examiner in Interference No. 49,569	832	1533
67-C.	Opinion of Board in Interference No. 49,569	832	1538
67D.	Opinion of the Court of Patent Appeals	832	W
68.	Record of Interference No. 49,575	...	W
68-A.	Opinion of Examiner in Interference No. 49,575	832	1541
68-B.	Opinion of Board in No. 49,575	832	1544

69-A(2).	Opinion of Examiner of Interferences in Interference No. 49,570	832	1551
69-B(1).	Petition for Rehearing in Interference No. 49,570	832	1554
69-B(2).	Opinion of Board in Interference No. 49,570	832	1556
69-B(3).	Opinion of the Board of Appeals in Interference No. 49,570	832	1558

Nos.		Offered Vol. II	Printed Vol. III
69-C.	Opinion of the Court of Customs and Patent Appeals in Interference No. 49,570	832	1562
70-A.	Opinion of the Examiner in Interference No. 49,571	832	1565
70-B.	Opinion of the Board in Interference No. 49,571	832	1570
71-A.	Head Portion of Piston of Franquist Type	944	W
71-B.	Skirt Portion of Piston of Franquist Type	944	W
72-A.	Head Portion of Piston of Maynard Type	945	W
72-B.	Skirt Portion of Piston of Maynard Type	945	W
73.	Ricardo Type Piston	951	W
74.	Drawing Showing Dimensions of Defendants' Exhibit Monckmeier 3-V	952	1573
75.	Drawing Showing Dimensions of Defendants' Exhibit Monckmeier 3-W	952	1575
76.	Ford 1933 Piston	1048	W
77.	Agreement, Aug. 4, 1917, between Mocers-Pitts, Cleveland Trust-Sawyer, Sterling-Alexander (Formal Offer not included in Narrative)	...	W
78.	Ditto of March 7, 1922 (Formal Offer not included in Narrative)	...	W
79.	Drawing of Iron Piston Used by Dorris Motor	1062	W
80.	Sterling Piston with Steel Strut	1063	W
81.	Docket Entry, Gulick vs. Packard Motor Car Co.	1090	W
82.	Ampler Receivership Statement of Feb. 6, 1914	1090	W
83.	Ampler Receivership Journal Entry	1090	W
84.	Ruling of Examiner in Abandoned Application of Ray R. Day for Patent	1091	1577

Nos.		Offered Vol. II	Printed Vol. III
85.	Certified Copy of the Drawings of the Abandoned Application of Ray E. Day, filed January 10, 1923, Serial No. 611,698	1091	1579
86.	Patent Office Interference	...	W

DEFENDANTS' EXHIBITS.

(*W* in last column signifies *Withdrawn or Omitted*)

Nos.		Offered Vol. I	Printed Vol. III
A.	Drawing produced by Venne[illegible] of Long 1916 Piston	352	1585
B.	Piston Used by Franklin.....	352	W
C.	Two Paragraphs from Service Department Bulletin, Sheet No. 262, April 8, 1920, of Franklin Automobile Co., entitled "Long Type Pistons".....	352	1587
D.	Seven paragraphs from Service Department Bulletin, Sheet No. 289, Nov. 11, 1920, of Franklin Automobile Co., entitled "New Design for Series Nine"...	352	1588
E.	Piston Purchased from M. K. Weems..	352	W
F.	Long 1916 Type Piston	352	W
G.	Piston Purchased from Franklin Factory	352	W
H.	Article from Franklin Service Bulletin No. 348, April 18, 1932, of Franklin Automobile Co., entitled "The Oval Type Piston"	352	1589
I.	Article from Page 1, Franklin Service Bulletin No. 369, Feb. 20, 1923, of Franklin Automobile Company, entitled "Piston and Wrist Pin Knocks," and Drawing on page 2, entitled "Drill Jig for Extra Oil Holes in Piston"	352	1591
J.	Forfeited and Abandoned Application of William M. Vennar for Improvement in Pistons, filed April 12, 1920, Serial No. 373,240	354	1595

Nos.		Offered Vol. I	Printed Vol. III
K.	Venner Drawing, Feb. 16, 1920.....	354	1603
L.	Letter from George J. Oltsch to Wm. M. Venner, dated Sept. 22, 1920	354	1605
M.	Photostat of page 149, showing Cut only in "The Gasoline Automobile," by Heldt, Vol. I	368	1607
N.	Article from Pages 8 and 9 of Manual for Trouble Shooters of Franklin Automobile Company, entitled "Piston Slap"..	372	1609
O.	Drawing produced by Chadwick, Long 6-Slot Piston	392	1611
P(1&2).	Core Box	392	W
Q.	Core Box	392	W
R.	Small Piston of Type made for Oldsmobile Car or Northway Motor	392	W
S.	Tracing of "Oldsmobile Six" Piston produced by Chadwick	392	1613
T-1.	Tracing produced by Chadwick of Long Pistons for Ford, Model T Car	392	1615
T-2.	Tracing produced by Chadwick of Long Pistons for Essex Car	392	1617
T-3.	Tracing produced by Chadwick of Long Pistons for Duesenberg Car.....	392	1619
U.	Weems' Advertisement on Page 124 of "Motor Age" for July 7, 1921	392	1621
V, V-1 to V-7.	Books of the Weems Company (Marked for Identification, 385).....	...	W
W.	Photostat of Trunk Piston added to by Chadwick to show T-Slot, Long Piston..	396	1623
X.	Digest of Defendants' Exhibit X, Agreement dated Sept. 20, 1919 between E. C. Long and M. K. Weems	407	1625
Y.	Photostat of Drawing by Stellman, Long 1916 Piston (Identified, 452).....	...	1627
Z.	L. M. Stellman's Report, dated March 18, 1919, entitled "Test on Long Pistons"	453	1629

Nos.		Offered Vol. I	Printed Vol. III
AA.	Digest of Defendants' Exhibit AA, License Agreement dated March 20, 1919, between E. C. Long and Franklin Mfg. Co.	454	1632
CC'(1).	Blueprint D-793X of The Aluminum Castings Co. (Drawing of proposed design of piston for H. H. Franklin Mfg. Co.)	466	1633
CC'(2).	Blueprint D-944X of The Aluminum Castings Co. (Drawing of proposed design of piston for H. H. Franklin Mfg. Co.)	466	1634
CC'(3).	Blueprint D-960X of The Aluminum Castings Co. (Drawing of proposed design of piston for H. H. Franklin Mfg. Co.)	466	1635
DD.	Sketch of Long Piston seen by Royalty in 1913	435	1637
EE.	Sketch of Long Piston by Royalty in February, 1918	437	1638
FF.	Sketch of other views of piston shown in Exhibit EE	438	1639
GG.	Photostat of Pattern Record Card marked D-8764	413	1640
HH.	Photostat of Pattern Record Card marked A-640	414	1641
II.	Photostat of Pattern Record Card marked B-122	414	1642
JJ.	Photostat of Pattern Record Card marked H-4	415	1643
KK.	Photostat of Pattern Record Card marked C-123	415	1644

Quarterly Statement

of

Licensed Pistons Sold or Otherwise Disposed of

by

WALKER M. LEVETT CO., W. M. LEVETT CORPORATION AND W. M. LEVETT (CALLED LEVETT)

A SUB-LICENSEE OF ALUMINUM COMPANY OF AMERICA

hunting

Period 1927 Quarter 2nd

(From April 1927 to June 30, 1927)

To Aluminum Company of America
Pittsburgh, Pa.

In compliance with license agreement which the undersigned has with you in relation to pistons per se, it reports that during the above period:

(E) It made and/or sold or otherwise disposed of the following pistons which contained or embodied some invention covered by or which were sold, or were after sale or at any other time modified, or to be, or capable of being modified so as to be covered by any one or more of the claims of any of the U. S. Patents or applications included in the contract between Aluminum Company of America and The Cleveland Trust Company, dated April 26, 1924 and marked "I."

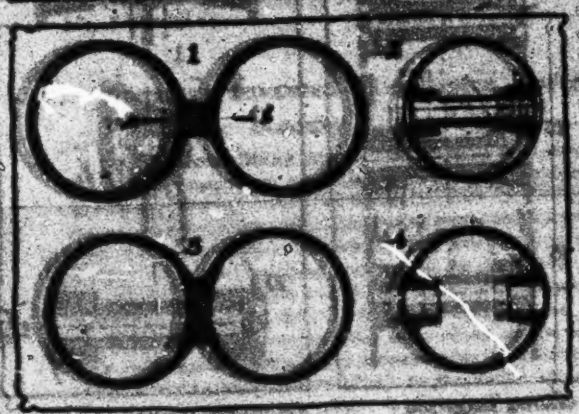
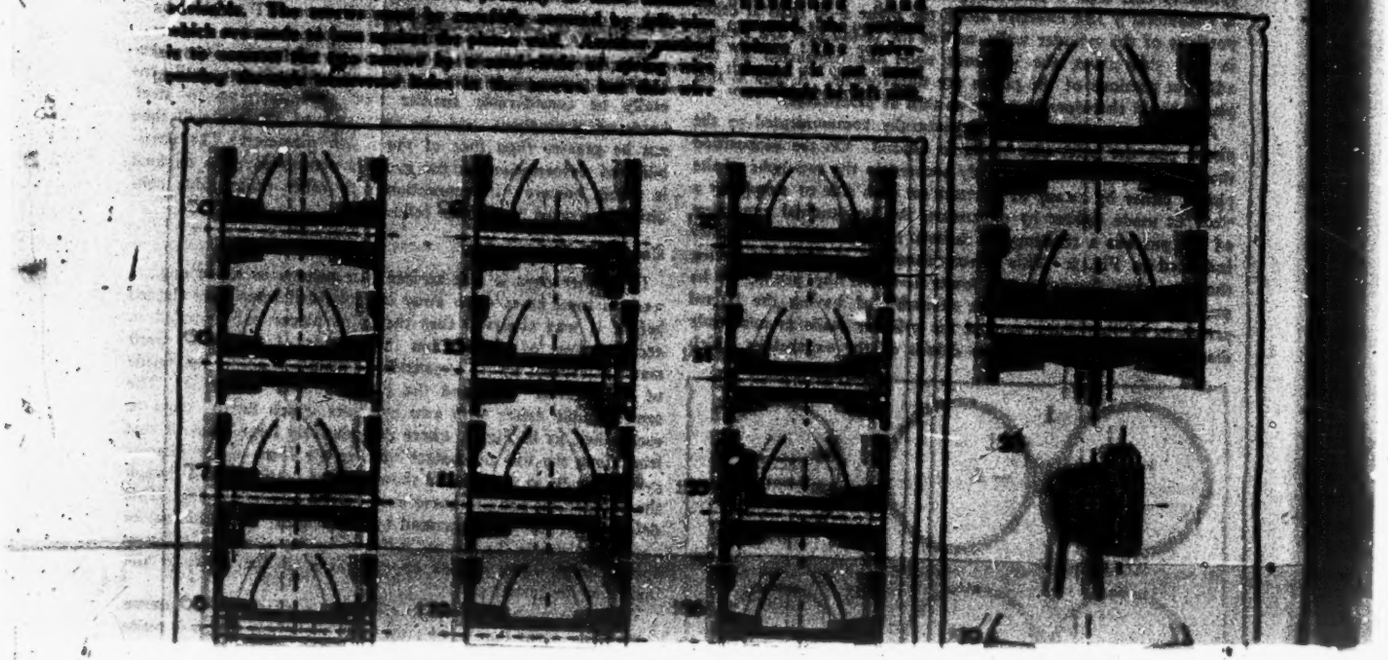
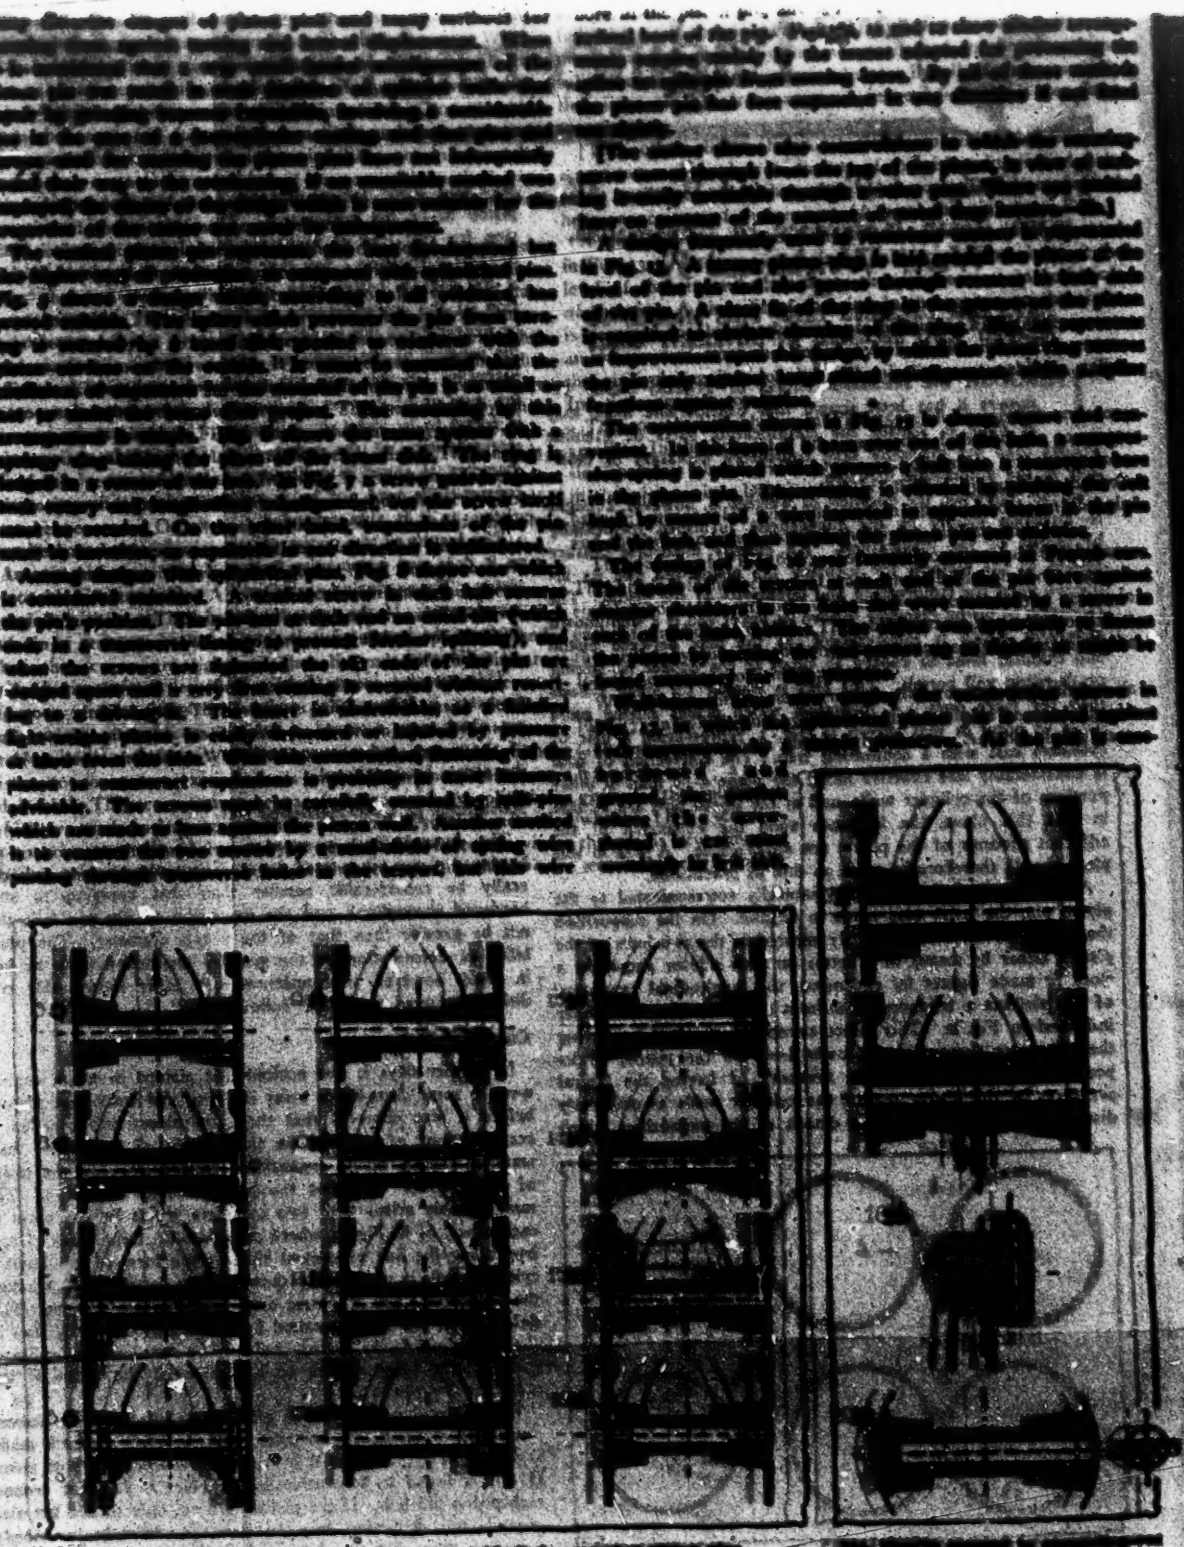
The Engineering Digest

The Design of Pinion and Pinion Bits with Bits Reference to Repairs, Wear, Weights and Fit







In the large majority of constructions the connecting-rod turns upon the pin and the latter is stationary, but in a few instances the pin is secured in the connecting-rod and the latter turns in bushings in the links. Fig. 18 shows a design of this type. The connecting-rod is slit and secured to the recessed piston pin by a cotter bolt. Expansion of the pin is here wholly without influence upon the elasticity of the pistons.

Fig. 19 shows a plan used for heavy motors. At the small end of the conical pin there is milled out a recess in which there is fitted a yoke projecting into notches in the links. A small screw with a leaf spring interacting with a notch in the end of the piston pin secures the yoke.—*From Der Motorwagen*, February 10.

Dry Disk Clutch and Mitred Sliding Gear in Leading French Sixer

AMONG construction features departing from standard design in the six-cylinder 35-50-horsepower Delaunay-Belleville cars the most noticeable relate to the clutch, shown in Fig. 20, and the transmission gear, Fig. 21. The multiple-disk clutch is composed of sheet steel disks lined with thermoid washers and inserted in a cup secured to the flywheel. The cup is perforated to allow heat to escape and is provided with lugs on which the driving disks are mounted. The action is dry, and

Figs. 20 and 21—Clutch and gears of Delaunay-Belleville three

centrifugal action is depended upon to keep dust out. The minimizing of maintenance is the object in view. Two universals are used on the clutch shaft.

The characteristic of the transmission gear lies in the use of mitre gears for the third speed as well as for the reverse, with silence in view for the drives most frequently used. The difficulties which were encountered in the matter of getting a mitred gear to slide into engagement as easily as a straight one, especially in the case of the third speed, were overcome, it is said, only after prolonged experimentation. Other difficulties related to the end-thrust pressures created by the operation of these gears. Both the primary and the secondary shafts are supported at the middle by ball-bearings.—*From La Vie Automobile*, February 14.

Bugatti's Inverted ¾-Elliptic Spring for Roomy Light Cars

AMONG recent British patents Eric Walford finds one for a spring suspension taken out by Bugatti, whose leap to prominence among makers of light fast cars in Europe has caused widespread attention. The patent shows an improvement over the quarter-elliptic anchored to the extreme rear of the vehicle frame and reaching forward to the axle with which

Aside from imparting to a car with short wheelbase the easy body movements which are normally obtained only by a longer wheelbase—which advantage it shares with the previous and better known type—the improved but more complicated spring seems to ensure an almost straight up-and-down movement of the axle, since the flexions of the two springs counteract each other with regard to the axle movement. Very little sliding motion in the universals will thus result from shocks, and brake action will also be more uniform. In addition it may perhaps be possible to obtain desirable effects by having the springs so proportioned that the oscillations of one break up those of the other. The special design of the semi-elliptic, which will make it flex into an S-shape, must be severe on the clip but apparently results in an efficient utilization of the amount of steel in it.—Ed.]

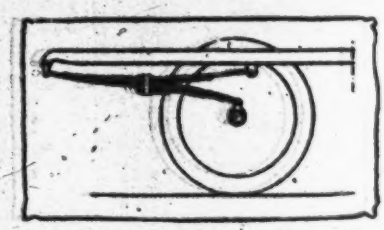


Fig. 22—New Bugatti spring for short wheelbases

New System for Keeping Voltage Constant Heralded from England

AN interesting new system for keeping the current delivered by a dynamo for lighting purposes in an automobile at a constant voltage, independently of the speed of the motor, is brought out by the Spiral Regulating Dynamo Company of London, England, and is illustrated in Figs. 23 and 24. The armature shaft is in the form of a sleeve riding upon a main shaft, in the surface of which there is cut a spiral groove of geometrically progressive pitch. A steel ball lodged in the spiral groove and at the same time in a straight groove in the hollow of the armature shaft maintains a driving-connection between these two shafts. The main shaft is driven, and if its speed is increased the armature tends to lag behind, owing to the increased magnetic pull between it and the pole pieces. The lagging is made possible by the nature of the driving-connection and therefore takes place, the armature shaft sliding along the main shaft against the resistance of a helical spring, and by this action the armature is withdrawn from its position in the magnetic field between the pole pieces. By suitably proportioning the strength of the spring and the pitch of the spiral groove, the effect of this lateral displacement of the armature with relation to the field can be so regulated that the actual number of lines of force cut by the armature windings during a given period of time is kept constant—this determining the voltage.

In addition to the main control, it is necessary at very low speeds to prevent the current from the battery from flowing through the armature coils and thus going to waste, as it has a tendency to do whenever the voltage of the battery current exceeds the voltage of the dynamo. To this end, whenever the motor speed falls off and the armature moves to the right, far enough, it engages a trigger attached to a movable contact piece and thereby causes it to slide out of engagement with the fixed contact piece, breaking the connection with the battery. On the other hand, when the armature moves to the left with increase of the motor speed, it is released from the trigger, a small spring forces the contacts together and the circuit is re-established.

[illegible] of the form [illegible], as shown, a design of this type. The connecting-rod is slit and secured to the crossed pivot pin by a cotter bolt. Reposition of the pin is here wholly without influence upon the elasticity of the pivots.

Fig. 19 shows a plan used for heavy motors. At the small end of the conical pin there is milled out a recess in which there is laid a yoke projecting into notches in the [illegible]. A small screw with a leaf spring interacting with a notch in the end of the pivots pin secures the yoke.—*From Der Motorwagen, February 10.*

Dry Disk Clutch and Mitred Sliding Gear in Leading French Sixer

AMONG conspicuous features departing from standard design in the six-cylinder 25-30-horsepower Delaunay-Belleville cars the most noticeable relate to the clutch, shown in Fig. 20, and the transmission gear, Fig. 21. The multiple-disk clutch is composed of sheet steel disks lined with thermoid washers and inserted in a cup secured to the flywheel. The cup is perforated to allow heat to escape and is provided with interior ribs which retain alternate disks. The action is dry, and

Figs. 20 and 21—Details and gears of Delaunay-Belleville three

centrifugal action is depended upon to keep dust out. The minimizing of maintenance is the object in view. Two universals are used on the clutch shaft.

The characteristic of the transmission gear lies in the use of mitre gears for the third speed as well as for the reverse, with silence in view for the drives most frequently used. The difficulties which were encountered in the matter of getting a mitred gear to slide into engagement as easily as a straight one, especially in the case of the third speed, were overcome, it is said, only after prolonged experimentation. Other difficulties related to the end-thrust pressures created by the operation of these gears. Both the primary and the secondary shafts are supported at the middle by ball-bearings.—*From La Vie Automobile, February 14.*

Bugatti's Inverted ¾-Elliptic Spring for Roomy Light Cars

A MONG current British patents Ettore Bugatti finds one for a spring suspension device put by Bugatti, whose leap to prominence among makers of light fast cars in Europe I [illegible] widespread attention. The patent shows an improvement over the quarter-elliptic underslung as used at the [illegible] frame and reaching forward to the axle, which [illegible] Bugatti cars of 1914 model now in use are equipped and which is also used on small Peugeot cars under license, and it appears that Bugatti declares the more recent design to have been found quite superior. The accompanying illustration shows the new spring to be a semi-elliptic to the middle of which a forwardly-reaching quarter-elliptic is clipped.—From *The Automobile Engineer, February.*

former inverse type—the improved but more complicated spring seems to ensure an almost straight up-and-down movement of the axle, since the distance of the two springs measured each other with regard to the axle movement. Very little sliding motion is, the universals still thus result from shocks, and brake action will also be more uniform. In addition it may perhaps be possible to obtain desirable effects by having the springs so proportioned that the oscillations of one break up those of the other. The special design of the semi-elliptic, which will make it flex into an S-shape, must be severe on the clip but apparently results in an efficient utilization of the amount of steel in it.—Ed.]

Fig. 22—New Bugatti spring for short wheelbases

New System for Keeping Voltage Constant Heralded from England

AN interesting new system for keeping the current delivered by a dynamo for lighting purposes in an automobile at a constant voltage, independently of the speed of the motor, is brought out by the Spiral Regulating Dynamo Company of London, England, and is illustrated in Figs. 23 and 24. The armature shaft is in the form of a sleeve riding upon a main shaft, in the surface of which there is cut a spiral groove of geometrically progressive pitch. A steel ball, lodged in the spiral groove and at the same time in a straight groove in the hollow of the armature shaft maintains a driving-connection between these two shafts. The main shaft is driven, and if its speed is increased the armature tends to lag behind, owing to the increased magnetic pull between it and the pole pieces. The lagging is made possible by the nature of the driving-connection and therefore takes place, the armature shaft sliding along the main shaft against the resistance of a helical spring, and by this action the armature is withdrawn from its position in the magnetic field between the pole pieces. By suitably proportioning the strength of the spring and the pitch of the spiral groove, the effect of this lateral displacement of the armature with relation to the field can be so regulated that the actual number of lines of force cut by the armature windings during a given period of time is kept constant—this determining the voltage.

In addition to the main control, it is necessary at very low speeds to prevent the current from the battery from flowing through the armature coils and thus going to waste, as it has a tendency to do whenever the voltage of the battery current exceeds the voltage of the dynamo. To this end, whenever the motor speed falls off and the armature moves to the right, far enough, it engages a stopper attached to a movable contact piece and thereby causes it to slide out of engagement with the fixed contact piece, breaking the connection with the battery. On the other hand, when the armature moves to the left with increase of the motor speed it is released from the stopper, a small spring forces the contacts together and the circuit is re-established. This cut-out switch arrangement is shown in Fig. 23.

With this system it has been shown that the lamps can be lighted directly from the dynamo, as may be desirable if the battery should fail. It is also claimed that the power consumed in running the dynamo is constant, since the magnetic torque is constant and no power is wasted in creating counter-currents at any motor speed.—From *The Auto*, February 14.

IN RE FILE WRAPPERS.

PRINTER'S NOTE: The system of typography employed in the following File Wrappers (Defendants' Exhibits, 4-L, 4-L_1, 4-L_2, 4-L_3, and 4-L_4) to simulate Patent Office markings, is as follows:

1. Words or phrases cancelled are indicated by "cancelled" type;
2. Words or phrases inserted *in substitution for words cancelled* and words or phrases added (other than of the kind indicated in paragraph 3) are indicated by "black-letter" type;
3. Words or phrases added or inserted by way of amendment of claims are indicated by "italic" type;
4. The insertion of whole new claims is indicated by the use of light rule above and below and along the left margin of such claims.
5. Cancellation of sentences or paragraphs by the drawing of diagonal cancellation lines across the face thereof is indicated by the use of heavy black rule above and below and along the left margin of the portions cancelled.
6. Marginal notations are indicated by block indentions, with black letter words or figures therein, opposite the cancellation or addition.

Division 12, Paper No. 1
Dec 3 1917
U. S. Patent Office

PETITION

To the Commissioner of Patents:

Your Petitioner, Edward J. Gulick, residing at Elkhart, County of Elkhart, State of Indiana, and whose P. O. Address is P. O. Box 553, Elkhart, Indiana, prays that Letters Patent of the United States may be granted to him for the Improvement in Hydrocarbon Motors, set forth in the annexed specification; and he hereby appoints Milton Tibbetts, (Registration No. 5403), of the City of Detroit, County of Wayne, State of Michigan, his Attorney, with full power of substitution and revocation, to prosecute this application; to make alterations and amendments therein; to receive the patent, and to transact all business in the Patent Office, and before the

Courts, D. C., connected with the application or with the patent granted thereupon, and to do all other lawful acts and things which he if personally present could.

EDWARD J. GULICK.

SPECIFICATION

To Whom It May Concern:

Be it known that I, Edward J. Gulick, a citizen of the United States, and resident of Elkhart, Elkhart County, State of Indiana, have invented certain new and useful improvements in ~~Hydrocarbon Motors~~ **Pistons** of which the following is a specification:

204661—1
MT:MEG
12427
B-1733

SB

per H This invention relates to ~~hydrocarbon motors~~
per H ~~and particularly to~~ pistons ~~therefor.~~
Title change per C per H One of the objects of the present invention is to provide a piston which ~~is~~ will not ~~adapted to~~ expand against the cylinder wall to such an extent as to ~~seize siese~~ or stick.

per E Another object of the invention is to provide a piston with a skirt ~~or guide portion~~ slightly separated from the head of the piston and split longitudinally so that it will not expand in circumference with a force great enough to cause the piston to stick in the cylinder.

per E Another object of the invention is to provide a piston with ~~improved lubricating means for lubricating conduits leading from the exterior of the piston to~~ the piston pin bosses.

Insert H¹ Another object of the invention is to rigidly support the piston pin bosses of a piston from the piston walls. (4) H¹

Other objects of the invention will appear from the following description taken in connection with the drawings which form a part of this specification, and in which:

Fig. 1 is a longitudinal sectional view through a piston embodying the invention;

Fig. 2 is similar to Fig. 1 taken at right angles thereto, being on the line 2—2 of Fig. 3;

Fig. 3 is a transverse section substantially on the line 3—3 of Fig. 1;

Fig. 4 is a transverse section on the line 4—4 of Fig. 1;

Fig. 5 is a view similar to Fig. 1, showing a slightly different form of piston embodying the invention; and

Fig. 6 is a top view of the piston shown in Fig. 5.

Referring to the drawings, 10 represents
Per E the head **portion** of a piston and 11 is the skirt
" E **or guide portion** which is shown as separated at its periphery from the head leaving an annular slit or opening 12 therebetween. The head portion of the piston is provided with an annular groove 13 for a piston ring 14, and the upper end of the skirt **portion**
Per E 11 is formed with **a recess shown in the form of** an annular groove 15 for the purpose of collecting the oil that may be scraped from the cylinder during the reciprocation of the piston.

The piston is also provided with a pair of separated piston pin bosses 16 which are formed with integral supporting flanges 17 extending around the bosses and arranged intermediate their ends. These flanges extend laterally of their respective bosses in the form of webs 18 which integrally connect with the wall of the
Per E ~~skirt~~ **guide portion** 11 as shown in the drawings.
" E Since there are two of these webs **or walls** 18 for each of the bosses 16 there are therefore four
" E connections of the webs 18 to the skirt **or guide portion** 11. These connections are in the four longitudinal lines as shown at 19.

The flanges 17 also extend upwardly from
" E the bosses in the form of webs **or walls** 20 leading to the head 10 and thereby connecting the bosses with the head. Thus, the bosses are connected to both the head and the skirt so that the latter is held in its proper position directly beneath the head as shown in Figs. 1 and 2.

In order that the skirt may not expand an undue amount when the piston is heated, as under operating

Insert E^1 conditions, ~~it~~ **(3)** E^1 is split longitudinally as at 21. This split is slightly diagonal to prevent
Insert E^2 wearing a groove in the cylinder **(3)** E^2

Per E The piston is further provided with conduits 22 shown in the form of pipes extending from the recess or groove 15 at the upper end of the skirt to openings 23 in the bosses. There is shown one conduit for each boss and it will be understood that the oil collected in the groove 15 by the piston in its reciprocation is led down through the conduits 22 to the interior of the piston pin boss to thereby lubricate the bearing.

Insert E³ F¹ The skirt 11 is formed with openings 24 in its side registering with the openings through the bosses 16 so that the piston pin may be inserted. (7) E³-F¹

Per E " E " E " E " E Insert E⁴ It will be seen that in addition to providing a piston with a split ~~skirt~~ guide portion the above described construction also provides ~~an extremely~~ a longitudinally rigid connection between the piston pin bosses and the ~~skirt~~ guide portion of the piston, which construction may be used either with or without the split ~~skirt~~ guide portion and separated head. The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with both the piston ~~skirt~~ guide portion and the head provide a particularly strong ~~support for the bosses.~~ (5) E⁴

Per E " E " E " E Insert E⁵ In Figs. 5 and 6 the webs or walls 18 are slightly curved between the flanges 17 and the ~~skirt wall~~ guide portion to thereby distribute the connection of the bosses to the ~~skirt~~ guide portion more evenly around the ~~skirt~~ piston. Otherwise the showing is substantially the same as in the other figures. (4) E⁵

It will be understood further that my invention is not limited to the details of construction shown and other forms may be used without departing from the spirit or scope of the invention. (X)

Having this described my invention, what I claim and desire to secure by Letters Patent is:—

Per A 1. A piston comprising a head, a skirt separated at its periphery throughout its cir-

cumference from the head, and pin bosses connected to the head and to the skirt, said skirt
Per A being split longitudinally **from its upper edge to its lower edge and** at one side between its
Per E connections to said bosses.

2. A piston comprising a head, a skirt
per A separated at its periphery **throughout its circumference** from the head, and pin bosses connected to the head and to the skirt, said skirt
" A being split diagonally **from its upper edge to its lower edge** between its connections to said bosses.

1E. ~~3.~~ A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the
Per E upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

2E. ~~4.~~ A piston comprising a head, a skirt separated at its periphery from the head, and
Per A pin bosses **integrally** connected to the head and to the upper and lower part of the skirt,
Insert A^1. **(4) A^1**

3E. ~~5.~~ A piston comprising a head, a skirt separated at its periphery from the head,
Per A and pin bosses **integrally** connected to the head and to the skirt in four longitudinal
Insert A^2 lines, **(4) A^2**

4E. ~~6.~~ A piston comprising a head, a skirt separated at its periphery from the head, and
Per A pin bosses connected to the head, and **also connected** to the skirt **both** above and below
Insert H^3 the bosses, **(2) H^3**
per H **5E.** ~~7.~~ ~~A~~ **An integrally cast** piston comprising a head, a skirt separated at its pe-
" A riphery from the head, and pin bosses **integrally** connected to the head and to the skirt at both sides and in the zone of said bosses,
Insert A^3 **(2) ~~H~~ A^3** **(over)**

1092870 8. A piston comprising a head, a skirt,
Per A piston pin bosses, and connections from the bosses to the head and skirt, substantially as described.

Per H

6E. ~~8a. 9. A~~ **An integrally cast** piston comprising a head, a skirt, separated piston pin bosses within the skirt, and an integral flange on each of said bosses intermediate its ends, said flange extending from both sides of the boss to the piston skirt and integrally united therewith in the zone of the boss, (2)

Insert H⁴

~~H⁴~~.

Per H

7E. ~~9a. 10.~~ A piston comprising a head, a skirt, separated piston pin bosses **integral with the head and disposed** within the skirt, and integral ~~means~~ **transversely flexible webs** extending from the intermediate part of each of said bosses to the skirt wall in the zone of the boss for supporting the bosses from the adjacent part of the skirt.

Stabel

10a. ~~11.~~ A piston comprising a head and skirt, said skirt having an annular groove, pin bosses within the piston, and means for

Per A

conveying oil from said **exterior** groove to

Per B

said bosses.

" A

11a. ~~12.~~ A piston comprising a head and skirt, said skirt having an annular **exterior**

" A

groove, pin bosses within the piston, **spaced from the wall of the skirt** and ~~a conduit~~ **pipes** leading from said groove to the interior of said bosses.

" A

8E. ~~10B. 12a. 13.~~ A piston comprising a head, a skirt having its periphery separated from the head, pin bosses in the piston **spaced from the wall of the skirt** and conduits leading from the top of said skirt to the interior of said bosses.

Insert A⁴

Per A

9E. ~~11B. 13a. 14.~~ A piston comprising a head, a skirt having its periphery separated from the head, pin bosses in the piston (2) **A⁴** means **integrally** connecting the bosses with the head and skirt, and ~~a conduit~~ **pipes** leading from the upper part of the skirt to the bosses.

10E. ~~12B. 14a. 15.~~ A piston comprising a head, a skirt, separated piston pin bosses within the skirt, and an intermediate flange on each of said bosses intermediate its ends, said flange extending laterally from both

sides of the boss to the piston skirt in a curve and integrally united with the skirt in the zone of the boss.

Insert C[1] (X)

6. 204661—6

In testimony whereof I affix my signature.

EDWARD J. GULICK.

OATH

COUNTY OF ELKHART,
STATE OF INDIANA, ss.

EDWARD J. GULICK, the above named petitioner, being sworn or affirmed, deposes and says that he is a citizen of the United States, and resident of Elkhart County, State of Indiana, that he verily believes himself to be the original, first, and sole inventor of the Improvement in HYDROCARBON MOTORS described and claimed in the annexed specification; that he does not know and does not believe that the same was ever known or used before his invention or discovery thereof, or patented or described in any printed publication in any country before his invention or discovery thereof, or more than two years prior to this application, or in public use or on sale in the United States for more than two years prior to this application; that said invention has not been patented in any country foreign to the United States on an application filed by him or his legal representatives or assigns more than twelve months prior to this application; and that no application for patent on said improvement has been filed by him or his representatives or assigns in any country foreign to the United States.

EDWARD J. GULICK.

Sworn to and subscribed before me this 23rd day of November, 1917.

WARD A. BERNET,

(Notarial Seal) *Notary Public.*

My commission expires May 4, 1921.

All communications respecting this application should give the serial number, date of filing, title of invention, and name of the applicant.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE

Washington, April 2, 1918.

Milton Tibbetts,
C/o Packard Motor Car Company,
Detroit, Michigan.

Please find below a communication from the EXAMINER in charge of the application of E. J. Gulick, for Hydrocarbon Motors, filed November 30, 1917, Serial Number 204,661.

JAMES T. NEWTON,
Commissioner of Patents.

This case has been examined.

The title of invention should be changed to one more suggestive of the actual improvement, such as "Pistons," "Hydrocarbon Motor Pistons," etc.

Claims 1 and 2 are rejected on the patent to—

Spillman, et al, 1,092,870, April 14, 1914, (74-85),

in view of it being old to split the skirt of a piston in the manner such as shown by the patent to—

Schoengarth, 1,174,092, March 7, 1916, (74-85).

Claims 6 and 8 are rejected on the patent to Spillman, supra.

Claims 11 and 12 are rejected on the patent to Spillman, supra, in view of the oil conduits shown by—

Nichols, 953,389, March 29, 1910, (74-85).

Claims 3, 4, 5, 7, 9, 10, 13, 14, and 15, are allowable as at present advised.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
Washington, Sept. 16, 1918.

Milton Tibbetts,
c/o Packard Motor Car Co.,
Detroit, Mich.

Please find below a communication from the EXAMINER in charge of the application of Edward J. Gulick, Ser. No. 204,661, filed Nov. 30, 1917; Hydrocarbon Motors.

JAMES T. NEWTON,
Commissioner of Patents.

Supplementary to the Office action of April 2, 1918.

Claims 4 and 7 are believed to be too broad in view of newly discovered references.

These claims are rejected on the patent to

Haas 1,229,258 June 12, 1917 (121-104) in view of British to Birmingham Small Arms Co., 21,435 Sept. 15, 1910 1 sheet 74-85. There would be no novelty in

duplicating the pin boss webs "17" of Haas so as to connect with the lower part of the skirt in view of the webs shown by Birmingham et al.

Claims 4 and 5 are further rejected on British patent to

Thomas 1411 June 13, 1914 1 sheet.

Claims 13 and 14 are rejected on Haas supra in view of Nichols of record. There would be no invention in making an oil conduit as shown by Nichols for the skirt of the Haas piston leading to the boss bearing.

A. B. REAVIS,
Actg Examiner, 12.

Div. 12
Serial No. 204,661

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

This application is amended as follows:

In the preamble of the specification change the title of the invention from "Hydrocarbon Motors" to —*Hydrocarbon Motor Pistons*—.

Claim 1, line 2, after "periphery" insert —*throughout its circumference*—; line 3, after "longitudinally" insert —*from its upper edge to its lower edge and*—.

Claim 2, line 2, after "periphery" insert —*throughout its circumference*—; line 3, after "diagonally" insert —*from its upper edge to its lower edge*—.

Claim 4, line 2, after "bosses" insert —*integrally*—; line 3, after "skirt" change the period to a comma and insert —*the outer ends of the pin bosses being*

A[1] Insert H[2] *spaced from the opposing parts of the skirt wall and said skirt having openings opposite the open ends of the bosses*—, (2) H[2]

Claim 5, line 2, after "bosses" insert —*integrally*—; line 3, after "lines" change the period to a comma and insert —*the ends* A[2] *of said bosses being spaced from the opposing parts of the wall of the skirt, said skirt hav-*

ing openings therethrough opposite the open ends of the bosses—.

Claim 6, line 3, after "head" insert a *comma* and after "and" insert —*also connected*—; same line, after "skirt" insert —*both*—.

Claim 7, line 2, after "bosses" insert —*integrally*—; line 4, after "bosses" change the period to a A[3] comma and insert —*the bosses having their* Insert H[3] *ends spaced from the opposing parts of the skirt wall*—, (2) H[3]

Cancel claim 8.

Change the numbers of claims 9 and 10 to 8 and 9 respectively.

Change the number of claim 11 to 10 and in line 3 thereof before "groove" insert —*exterior*—.

Change the numeral of claim 12 to 11 and in line 2 thereof before "groove" insert —*exterior*—, and after "piston" cancel the comma and insert —*spaced from the wall of the skirt*—; line 3, cancel "a conduit" and insert —*pipes*—.

Change the numeral of claim 13 to 12 and in line 2 thereof after "piston" cancel the comma and insert —*spaced from the wall of the skirt*—;

Change the numeral of claim 14 to 13 and in line 2 thereof after "piston" cancel the comma and insert —*the ends of said bosses being spaced from the* A[4] *walls of the skirt*—; line 3, after "means" insert —*integrally*—; lines 3-4, cancel "a conduit" and insert —*pipes*—.

Change the number of claim 15 to 14.

REMARKS

The splitting of the skirt cooperates with the peripheral separation of the skirt from the head to perform a unitary function, namely that of permitting sufficient

contraction and expansion of the skirt without seizing. In the Schoengarth patent there is no separated skirt, and hence there can be no definite relation between such a skirt and a split or weakened formation therein. In applicant's case the split runs entirely through the skirt, and hence there is a capacity for continuous yielding throughout the entire length of the same. There is clearly a true combination between the split and the other form of division consisting of the peripheral separation of the skirt from the head, and hence the subject matter of claims 1 and 2 as now amended is not met by Spillman and Schoengarth taken together.

In regard to the subject matter of claims 4, 5 and 7, the Haas patent does not show the pin bosses integrally connected to the head and to the skirt. In all the forms shown by Haas the head, or part of the head, is separate from the skirt and connected thereto by screws or bolts. Nor does Haas show the bosses spaced at their ends from the wall of the skirt.

The British patent to Birmingham does not show the spaced piston bosses.

The British patent to Thomas does not show the pin bosses integrally connected to the head and does not have the openings in the skirt opposite the open ends of the bosses.

In respect to the subject matter of original claims 11 to 14 inclusive, Spillman does not have the exterior groove for receiving the oil, but an inwardly inclined edge 14 which serves to deflect the oil back into the piston and does not serve to collect the same so that it may be led from the groove through conduits down into the bosses, nor does Nichols show the pipes provided in the

body of the piston, but, on the contrary, merely has channels cut through the ordinary piston wall.

Nor does the Haas patent disclose anything more pertinent to this oiling arrangement than the Spillman patent, even when taken in connection with Nichols.

Respectfully submitted,

EDWARD J. GULICK.
By MILTON TIBBETTS,
His Attorney.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE

Washington, November 15, 1919.

Milton Tibbetts,
c/o Packard Motor Car Co.,
Detroit, Michigan.

Please find below a communication from the Examiner in charge of the application of Edward J. Gulick, Filed Nov. 30, 1917, Serial No. 204,661, Hydrocarbon Motor Pistons.

JAMES T. NEWTON,
Commissioner of Patents.

Responsive to the amendment of July 26, 1919.

Claims 1 and 2 are rejected upon either the patent to Spillman, of record or the French patent to

Chenard, 468,595, (1 sheet) (74-108)

especially in view of either the patent to Schoengarth, of record or the French to

Panhard, 480,650, (1 sheet) (74-108A).

Claims 3, 4 and 7 are rejected upon the patent to Spillman, supra, in view of the British patent to

Ricardo, 17,953, Dec. 23, 19165 (74-108).

Claim 6 is rejected upon the patent to Ricardo, supra.

Claims 10 and 11 are rejected upon the patent to

Stabel, 753,527, Mar. 1, 1904 (74-108L).

Claims 5, 8, 9, 12, 13 and 14 are allowable.

P. P. PIERCE,
Examiner.

IN THE UNITED STATES PATENT OFFICE

Edward J. Gulick, Room 332
Hydrocarbon Motors, Div. 12
Filed November 30, 1917. Serial No. 204,661

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In response to the Office Action of November 15, 1919, please amend the above entitled application as follows:

B

Cancel claims 10 and 11 and renumber the remaining claims.

REMARKS

Reconsideration is respectfully requested for claims 1 to 3 inclusive since the references cited by the Examiner do not disclose the inventions set forth. In each of these claims is defined a piston, comprising a head, a skirt separated at its periphery throughout its circumference from the head, and pin bosses connected to the head and to the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

In addition to this description claims 1 and 2 specify that the skirt is split diagonally from its upper edge to its lower edge. Claims 1 and 2 are rejected on Spillman or the French patent to Chenard in view of Schoengarth or the French patent to Panhard. The Spillman patent discloses merely a piston having its head and skirt separated at the periphery of the head and bosses connected

to the head and to the skirt, and this is also true of the French patent to Chenard.

The patent to Schoengarth discloses a piston having a head and skirt connected together at the periphery of the skirt, or in other words, formed in one piece, and this patent also has a pair of slots, 3 and 4, the slot 3 being cut into the skirt of the piston from the side toward the longitudinal center, and the slot 4 being cut diagonally from the junction of the slot 3 with one of the walls to the lower end of the skirt. From the specification of Schoengarth we learn that these slots were formed merely for the purpose of providing an adjustment whereby the circumference of the skirt could be varied and this adjustment is secured by means of the screws or studs, 5 and 5'. It is evident, therefore, that the diagonal slot 4 could not function in the manner of applicants diagonal slot 21, and that the patentee had no such object in mind in providing the slot 4.

The French patent to Panhard shows a piston construction in which there appears to be provided a longitudinal slot reaching from one end of the piston to the other, but it is not understood how this piston could operate in the manner illustrated, since the slot would apparently permit a leakage of gas past the piston. In the Panhard patent, there is not disclosed a piston made up of a head and a skirt separated from the head.

From the above outline of the patents cited against these claims, it is evident that no one of the patents dis-

closes the combination claimed, and it is also evident that the object of the invention could not be attained without the use of all the elements of the combination, namely

the head, the skirt separated from the head at its periphery, the bosses connected to the head and to the skirt, and the slot extending throughout the length of the skirt. For these reasons it is respectfully submitted that all the elements combine to form a true combination, and that none of the patentees had in mind the accomplishment of the object for which applicant's device was designed. It is believed, therefore, that claims 1, 2 and 3 inclusive are allowable.

It is noted that the Examiner rejected claim 3 on the Spillman patent taken with the British patent to Ricardo, but this rejection appears to have been inadvertent, or based upon a misunderstanding of the scope of the claim, since neither Spillman nor Ricardo discloses the piston having the skirt split longitudinally. For this reason it has been assumed that claim 3 should have been grouped with claims 1 and 2, and therefore this claim was discussed in connection with the preceding claims.

In connection with the citation of the British patent to Ricardo, attention is called to the fact that the pin bosses are not connected to the head and to the skirt as in applicant's construction, and as set forth in the claim, but in Ricardo the pin bosses are connected to a downwardly extending portion "B" formed integrally with the head "A" and the skirt "E" is bolted to this same portion "B."

Reconsideration is respectfully requested for claims 4 and 7, rejected on Spillman and on Ricardo, and since claim 4 calls for pin bosses integrally connected to the head and to the upper and lower part of the skirt and

claim 6 calls for the pin bosses connected to the head and also connected to the skirt both above and below the bosses. As above pointed out the bosses "F" in Ricardo are not connected to the skirt, and in the Spillman patent the bosses are not connected to the upper and lower portions of the skirt, and are not connected to the skirt both above and below the bosses. For these reasons it is believed that claims 4 and 6 are allowable.

Claim 7 distinguishes from the patents to Spillman and Ricardo, for the reasons pointed out in connection with claim 4.

Former claims 10 and 11 have been cancelled since the subject matter of these claims appeared to be sufficiently covered in the claims which were retained.

The above amendment is believed to be fully responsive to the last Office Action, and a favorable Action is respectfully requested.

Respectfully submitted,

EDWARD J. GULICK,
By MILTON TIBBETTS,
His Attorney.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE

Washington, Nov. 19, 1920.

Milton Tibbetts,
c/o Packard Motor Car Co.,
Detroit, Mich.

Please find below a communication from the Examiner in charge of the application of Edward J. Gulick, Filed Nov. 30, 1917, Serial No. 204,661, Hydrocarbon Motor Pistons.

R. F. WHITEHEAD,
Commissioner of Patents.

Responsive to the amendment of Sept. 24, 1920.

Claims 1 to 3 inclusive are again rejected on Spillman et al, of record, in view of

Spillman, 1,325,176, Dec. 16, 1919 (74-108-A).

It is common in the art to split the skirt of a piston longitudinally for the purpose of allowing the same to expand against the walls of the cylinder by the application of heat.

Claims 4, 6 and 7 are rejected as being met in terms by

Ricardo, 1,294,833, Feb. 18, 1919 (74-108).

The remaining claims are allowable.

C

Sir:—

This application is amended as follows:

In the preamble please change the title from "Hydrocarbon Motor Pistons" to —*Pistons*—.

Page 2, line 4, change "is not adapted to" to —*will not*—.

Add the following claims:

—13. A piston comprising integral head and skirt portions, said piston being formed with a transverse slit

near its upper end and with a **longitudinally**
Per D **~~diagonally~~** extending slit running from the transverse slit to the free end of the piston skirt,
C adjacent parts of the skirt across said **longitu-**
Per D **dinal ~~diagonal~~** slit being entirely disconnected to permit free expansion and contraction of the skirt parts.

merely integral as Spillman
Per E

14. A piston comprising integral head and skirt portions, said piston being formed with a transverse slit extending entirely around the piston near its
Per D upper end and with a **~~diagonally~~ longitudinally** extending slit running from the transverse slit to the free end of the piston skirt, adjacent parts
" D of the skirt across said **longitudinal ~~diagonal~~** slit being entirely disconnected to permit free expansion and contraction of the skirt parts.

15. A piston comprising integral head and skirt portions, said piston being formed with a transverse slit near its upper end and with a **~~diagonally~~**
Per D **longitudinally** extending slit running from the

transverse slit to the free end of the piston skirt, adjacent parts of the skirt across said **~~diagonal~~**
Per D **longitudinal** slit being entirely disconnected to permit free expansion and contraction of the skirt parts, and piston pin bosses formed as an integral part of the piston.

16. A piston comprising a head having a ring adapted to contact with the cylinder wall,
Per D a skirt having a **longitudinally ~~diagonally~~** extending slit permitting it free expansion and contraction, and means integral with the head and the skirt connecting the head with the skirt and arranged to be out of contact with the cylinder wall in the operation of the piston.
Per E

17. A piston comprising a head having a ring adapted to contact with the cylinder wall,
Per D a skirt having a **longitudinally ~~diagonally~~** extending slit permitting it free expansion and contraction, and means integral with the head and the skirt connecting the head with the skirt and arranged to be out of contact with the cylinder wall in the opera-

tion of the piston, and piston pin bosses formed in said connecting means.

Per D 18. A piston comprising a head having a ring adapted to contact with the cylinder wall, a skirt having a **longitudinally** ~~diagonally~~ extending slit permitting it free expansion and contraction, and means integral with the head and the skirt connecting the head with the skirt and arranged to be out of contact with the cylinder wall in the operation of the piston, and piston pin bosses formed in said connecting means, the outer ends of said bosses being slightly inside the normal diameter of the piston skirt.

C' **11E** ~~19~~. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the

bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated

Per E from the head portion except through the boss connections, and the skirt portion being ~~slit~~ **split** longitudinally of the piston to permit free expansion and contraction.

C' contd **12E**. ~~20.~~ A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated

Per E from the head portion except through the boss connections, and the skirt portion being ~~slit~~ **split** longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

13E. ~~21.~~ A piston having a head portion with a ring groove therein, a skirt portion having its cylinder ~~contact~~ **engaging** part separated

Per E from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the

" E head portion respectively, said skirt being ~~slit~~ **split** from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

Insert E' Cls 14-29

D'

REMARKS.

Reconsideration of this application in its present form is respectfully requested.

Claims 1, 2 and 3 are rejected on Spillman 1,092,870 *in view of* Spillman 1,325,176. Attention is called to the fact that the application for the later Spillman patent was filed February 12, 1919 whereas applicant's case

3. 204661—22

12440

was filed November 30, 1917. Under these circumstances the later Spillman patent is, of course, no reference and must be withdrawn and since these claims are admittedly not met in the earlier Spillman patent alone these claims should be allowed.

Claims 4, 6 and 7 are rejected on Ricardo 1,294,833 the application for which was filed April 23, 1918. Applicant's case was filed November 30, 1917 so that Ricardo is no reference against him. It is requested that this Ricardo patent also be withdrawn as a reference.

Several new claims have been inserted which clearly differentiate from all of the valid references cited and allowance of these claims is also requested.

Respectfully submitted,

EDWARD J. GULICK,
By MILTON TIBBETTS,
His Attorney.

Dec 24 1921
U. S. Patent Office

IN THE UNITED STATES PATENT OFFICE

Edward J. Gulick
Pistons
Filed November 30, 1917

Room No. 322
Division No. 12
Serial No. 204,661.

Hon. Commissioner of Patents,
Washington, D. C.

D

Sir:—

In addition to the amendment filed October 29, 1921, this application is hereby further amended as follows:

Claims 13, 15, 16, 17 and 18, line 3, and claim 14, line 4, change "diagonally" to *—longitudinally—*.

Claims 13, 14 and 15, line 6, change "diagonal" to *—longitudinal—*.

Add the following claims:

do 1 —22. A piston comprising integral head and skirt portions, the head portion having a piston ring part, said piston being slit through
D its side wall transversely and longitudinally, the transverse slit being immediately below said ring part, and the longitudinal slit extending
Per E from the transverse slit to the lower end of the skirt to allow for expansion of the skirt portion.

do 1 23. A piston comprising integral head and skirt portions, the head portion having a piston ring part, said piston being slit through its side wall transversely and longitudinally, the transverse slit being immediately below said ring part and extending entirely around the piston, and the longitudinal slit extending from the transverse slit to the lower end of the skirt to allow for expansion of the skirt portion.

do 1 24. A piston comprising integral head and skirt portions, the head portion having a piston

204661—24

ring part, said piston being slit through its side wall transversely and longitudinally, the transverse slit being immediately below said ring part, and the longitudinal slit extending from the transverse slit to the lower end of the skirt to allow for expansion of the skirt portion, adjacent parts of the skirt across the longitudinal slit being entirely disconnected to permit free expansion and contraction of the skirt portion.—

REMARKS

A patent relating to this art which has not been cited up to this time is the patent to Franquist, No. 1,153,902, dated September 21, 1915, and claim 22, here-

inabove, is designed to distinguish from the Franquist construction by reason of the transverse slit being arranged below the piston ring part of the piston. It will be noticed that in Franquist, particularly in Figs. 1 and 2, that the slit 17 which extends part way around the piston is at the base of the lower piston ring slot or groove. This would cause the piston skirt to expand upwardly and tend to close the ring groove and thus interfere considerably with the operation of that particular piston ring. In applicant's construction the transverse slit is entirely below the ring portion of the piston and that feature is brought out in claim 22. Since applicant is the first to use the transverse and longitudinal slits in which the transverse slit is below the piston rings, he should be entitled to this claim.

Claim 23 is similar to claim 22 except that it is limited by calling for the transverse slit extending entirely around the piston. Claim 22 would cover pistons slotted only partly around their circumference.

In order to anticipate the Examiner's rejection of claim 22 on the patent to Schoengarth, cited, we are filing herewith an affidavit of the applicant carrying his date of invention back of the filing date of Schoengarth. Applicant made this invention and made some of these pistons and successfully used them before Schoengarth filed, so that Schoengarth is no longer a reference.

Claim 24 is similar to claim 22 except that the adjacent parts of the skirt across the longitudinal slit are referred to as being entirely disconnected, which is not true of Schoengarth. This claim, therefore, is allowable regardless of the patent to Schoengarth as a reference.

Respectfully submitted,

EDWARD J. GULICK,
By MILTON TIBBETTS,
His Attorney.

Amendment E

The Commissioner of Patents,
Washington, D. C.

Sir:—

In response to the Office Action of January 30th, 1922, applicant amends as follows:

On page 2 of the specification, line 7, after "skirt" insert —*or guide portion*—.

Same page, lines 12 and 13, strike out "lubricating conduits leading from the exterior of the piston to" and insert —*improved lubricating means for*—.

On page 3, line 4, after "head" insert —*portion*—.

Same page, line 5, after "skirt" insert —*or guide portion*—.

Same page, line 9, after "skirt" insert —*portion*—, and after "with" insert —*a recess shown in the form of*—.

Same page, line 17, cancel "skirt" and insert —*guide portion*.

Same page, line 18, after "webs" insert —*or walls*—.

Same page, line 20, after "skirt" insert —*or guide portion*—.

Same page, line 23, after "webs" insert —*or walls*—.

On page 4, line 1, strike out "it" and insert in lieu thereof —*the cylinder-engaging part of the guide at one side of the pin bosses which takes the angular* E¹ *thrust of the connecting rod during one stroke of the piston*—.

Same page, line 2, after "cylinder" insert —*and it effects a complete severing of the guide* E² *wall so that the separated edges of the split are*

unrestrained for movement toward and from each other—.

204661—32

Ser. No. 204,661. 12442

Same page, line 4, before "in" insert —*shown*—, and before "groove" insert —*recess or*—.

Same page, line 12, after the period, insert —*As these openings are well above the bottom of the guide portion of the piston the lower end of the piston skirt is left unbroken, except for the split 21*—.

E³ Per F

Same page, line 14, cancel "skirt" and insert —*guide portion*—.

Same page, line 15, cancel "an extremely" and insert —*a longitudinally*—.

Same page, line 16 and line 17, cancel "skirt" and insert —*guide portion*—.

Same page, line 20, after "with" insert —*both*—, and cancel "skirt" and insert in lieu thereof —*guide portion and the head*—.

Same page, line 21, cancel "support for the bosses" and insert —*construction, and at the same time, when the longitudinal split is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston*—.

E⁴

Same page, line 22, after "webs" insert —*or walls*—.

Same page, line 23, cancel "skirt wall" and insert —*guide portion*—.

Same page, line 24, cancel "skirt" and insert —*guide portion*—.

Same page, line 25, cancel "skirt" and insert —*piston*—.

Same page, after line 26, insert the following:

—*while my piston is, of course, adapted for use in either vertical, inclined, or horizontal engines, for convenience I refer in some instances to its head end and its open end as the upper and lower ends or parts, respectively*—.

E⁵

Cancel Claims 1 and 2.

Renumber Claim 3 as 1 and in line 3 change "part" to —*parts*—.

Ser. No. 204,661. 12443

Renumber Claims 4 to 12, inclusive, as 2 to 10, inclusive.

Cancel Claims 13 to 18, inclusive.

Renumber Claim 19 as 11, and in line 8 thereof, change "slit" to —*split*—.

Renumber Claim 20 as 12, and in line 8 thereof, change "slit" to —*split*—.

Renumber Claim 21 as 13, and in line 2, change "cylinder contact" to —*cylinder-engaging*—.

Same claim, line 6, change "slit" to —*split*—.

Cancel Claims 22, 23 and 24.

Insert the following claims:

—14. A piston for internal combustion engines comprising in combination a head portion having an end wall and a ring-packed side wall, a guide portion having (1) H[3] diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall of the head portion by an unobstructed air gap, a pair of separated pin bosses disposed on an E[3] axis between said cylinder-engaging parts, a pair of longitudinally disposed walls connected to said bosses and each joined at relatively widely separated points to the said cylinder-engaging parts above and below the plane of the boss axis, said walls being disposed within the maximum diameter of the piston, and integral, rigid connections extending from the bosses to the head portion.

per K

~~28. 29F. 27.~~ A one piece piston provided with a solid end portion and a skirt portion

per H²

having oppositely disposed thrust bearing faces and, said skirt portion having a longitudinally extending slot formed through the thickness of its wall, said slot extending from

per H

the rear edge of the skirt portion through one of said thrust bearing faces and forming ad-

per H

jacent disconnected parts of a thrust bearing face portions in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

~~29. 30F. 28.~~ A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.—.

Insert G¹ (Cls 30-32)

The foregoing amendment has been prepared after a very careful consideration not only of the references last cited by the Examiner but of all prior art known to the applicant.

A reconsideration is respectfully asked of Claims 1, 12, and 13, previously numbered 3, 20, and 21, respectively, as it is thought that these claims were rejected improperly and possibly unintentionally.

Claim 1 specifies that the pin bosses are connected to the head and to the *upper and lower parts* of the skirt. This language is believed to clearly and patentably distinguish the claim from the prior art, indeed such distinction has been recognized by the Examiner in the allowance of Claim 4, previously numbered 6.

Claim 12 is distinguished from the references in

much the same manner by specifying "connecting flanges in the zone of the bosses - - -." In addition, Claim 12 specifies the two separated pin bosses, circumferential and longitudinal splits or slots to permit free expansion and contraction of the skirt portion, and the cutting away of the skirt portion adjacent the ends of the bosses. It is submitted that the Examiner's rejection of this claim is not justified, because the Spillman et al patent No. 1,092,870 has neither the connecting flanges in the zone of the bosses nor the longitudinal split in the skirt, and the piston of the Ebbs patent, which is designed for heavy slow moving internal combustion engines does not have the separated bosses, nor does it have a skirt portion "cut away adjacent the outer ends of the piston bosses" and, finally, the patent to Van Bever has slots 16 which provide for the adjustment of the piston skirt but do not "permit free expansion and contraction." The ring 17 of Van Bever positively prevents contraction.

Claim 13 specifies that the cylinder-engaging part is separated from the head portion and that the skirt is split "on one side only of the pin bosses to permit free expansion and contraction of the skirt portion." This construction is especially advantageous in that applicant's piston can be mounted so that the relatively light angular thrust of the connecting rod during the compression stroke is taken by the relatively weak split side of the piston guide structure whereas the much heavier angular thrust during the explosion stroke is sustained by the stronger unsplit side of the guide structure. There is no suggestion of this feature in the references.

With respect to the claims which have been cancelled and the new claims which are presented by the foregoing

amendment, applicant desires to remark that many if not all of the claims cancelled are believed to have presented subjects matter patentable over the references and have only been cancelled with a view to a clearer

and better presentation of the subjects matter in the new claims. With respect to these new claims attention is directed to the following considerations:

Claim 14 brings out the relative arrangement of the head and guide portions, the bosses, and the connecting walls or webs, and calls for an unobstructed air gap between the ring-packed side wall of the head portion and the upper edges of the active cylinder-engaging parts of the guide portion. By active cylinder-engaging part, I mean the part of the guide structure at one side of the pin bosses which is active in sustaining the angular thrust of the connecting rod. The practical merit of the structure defined by this claim has been thoroughly demonstrated in practice. The inter-connection of the head and guide portions and the bosses by the longitudinally disposed webs or walls provides a construction that is exceedingly strong in its adaptation to resist longitudinal stresses and at the same time the unobstructed air gap between the head and guide portions insures the lowest possible working temperature in the active cylinder-engaging parts of the guide.

Claim 15 brings out the provision of a guide with a cylinder-engaging part on one side that is separated by an air gap from the head portion and that is split longitudinally to accommodate expansion incident to the heating of the piston. One of the notable advantages of this construction has already been pointed out in connection with Claim 13. It may be noted, furthermore, that the patent to Ebbs, which the Examiner cited to show a slotted skirt structure, shows slots or openings between the two active cylinder-engaging parts of the guide and does not show an active cylinder-engaging part which is itself slotted to accommodate expansion under heating.

Claim 16 calls for active cylinder-engaging parts on both sides of the piston which are separated from the head portion by air gaps, with one of the said cylinder-engaging parts split longitudinally. Clearly, this subject matter is not disclosed in the references.

Ser. No. 204,661. 12450

Claim 17 is along the line of Claim 14 but brings out in addition the unbroken skirt formation between the active cylinder-engaging parts at the lower or open end of the guide portion of the piston.

Claim 18 is along the line of Claim 17 but specifies in addition the longitudinal split through one of the active cylinder-engaging parts.

Claim 19 is directed more especially to the nature of the connections between the bosses and the head, in conjunction of course with other features of applicant's construction.

Claim 20 is along the line of Claim 16 but is more specific as to the walls joining the head and guide portions and the bosses.

Claim 21 is also along the line of Claim 16 but specifies in addition the yielding or resilient character of the guide structure which permits the closing and opening of the split wall of the skirt.

Claim 22 brings out more specifically the location of the longitudinal split of the guide portion with respect to the walls which connect the guide portion, the bosses and the head.

Claim 23 brings out the relation of the head and guide portion, the bosses and the longitudinally disposed walls which connect them, the structure defined being exceedingly strong with respect to the longitudinal stresses to which the piston structure is subjected.

Claim 24 is along lines somewhat similar to Claim 23 but brings out the curved formation of the connecting webs or walls, one form of such construction being shown in Figs. 5 and 6 of the drawing.

Claim 25 is specifically directed to applicant's means which are provided for oiling the pin boss bearings.

Claims 26 and 27 are identical with Claims 5 and 10, respectively, of the patent to Long, No. 1,395,441.

Claim 28 is identical with Count 1 of the Issue in

Interference No. 43,351, Hartog vs. Pomeroy, which has recently been brought to applicant's attention.

Applicant seems clearly entitled to make Claims 26, 27 and 28 and believes that he is the first inventor of the subjects matter defined in said claims.

In the drawing, the reference numeral "19" is incorrectly applied in Figs. 1 and 5. Permission is re-

quested to have these numerals changed to agree with Fig. 3 and with the specification as shown on the print filed herewith.

Respectfully submitted,

EDWARD J. GULICK,
By MILTON TIBBETTS,
His Attorney.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
Washington, Oct. 6, 1922

Milton Tibbetts,
c/o Packard Motor Car Co.,
Detroit, Mich.

Please find below a communication from the Examiner in charge of the application of Edward J. Gulick, Filed Nov. 30, 1917, Serial No. 204,661, Pistons.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Amended Sept. 11, 1922.

Claims 14 and 16 to 22 inclusive are rejected as being unwarranted by applicant's disclosure. The skirt portion shown by the drawings is not divided into "parts," "sections" or "portions." The same consists of a

single unitary structure or cylindrical body split on one side only. It is not thought such a structure can be accurately described as being divided into "segments" or parts. Such a division would be purely arbitrary and along imaginary lines, as it would be extremely difficult to ascertain just where one part ended and the other began, the whole skirt being in one piece.

Claim 25 is rejected on Nichols of record in view of Marcil, 920,165, May 4, 1909 (74-109-4)

Claim 26 is rejected as being unwarranted. It is not thought that the configuration formed by joining the circumferential and vertical or longitudinal slots, shown by applicant, can be accurately described as "T-shape." There appears to be a too remote resemblance, if any, between a "T" and a character of this nature "p", or

204661—43

204,661—2

this "q".

Inasmuch as the subject matter defined by claim 28 does not appear to have been embraced in the statement of invention or claims originally presented, applicant is required to file a supplemental oath, in accordance with Rule 48 of the Rules of Practice, in support of same.

The remaining claims are allowed.

The examiner notes that allowed claim 27 has been copied from the patent to Long, No. 1,395,441, and interference proceedings will be instituted in due course.

P. P. Pierce,
Examiner.

~~Not~~ ent Ch.

The Commissioner of Patents,
Washington, D. C.

Sir:—

In response to the Office Letter of October 6th, 1922, applicant amends as follows:

On page 4 of the specification, strike out the matter heretofore inserted in line 12 after the period, and insert in lieu thereof the following: —*As these openings are well above the bottom of the guide portion of the piston the lower end of the piston skirt is left unbroken, except for the split 21, and the arcuate parts of the skirt beneath said openings may be looked upon as joining the lower ends of the diametrically opposite cylinder-engaging parts of the guide that sustain the angular thrust of the connecting rod.*—

Insert the words —*on an axis*— at the following points in the claims:

Claim 14, line 7, after "disposed";
Claim 16, line 7, after "disposed";
Claim 17, line 9, after "disposed";
Claim 18, line 10, after "disposed";
Claim 19, line 5, after "disposed";
Claim 20, line 8, before "between";
Claim 21, line 7, after "disposed";
Claim 22, line 6, after "disposed".

In Claim 17, line 5, and in Claim 18, lines 4 and 5, strike out "constituting unbroken continuations of" and insert in lieu thereof —*joining*—.

204661—45

Serial No. 204,661. 12453

In Claim 19, line 4, before "each", insert —*to take the angular thrust of a connecting rod and* —.

Same claim, line 9, change "end portions" to —*head portion*—.

Strike out Claims 25 and 26, and insert the following claims:

—25. A piston for internal combustion engines, comprising a head portion, a guide portion, a pair of separated pin bosses having their outer ends within the maximum diameter of the

piston, and means for lubricating the interior of each of said bosses comprising a passage extending entirely through its wall, a recess in the peripheral wall of the guide portion and a duct leading from said recess to said passage.

---

25. ~~26.~~ An integrally formed piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a pair of separated pin bosses, and a guide portion
per H connected to said bosses and having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part
per H being separated at its upper end from said side wall of the head portion by an air gap and be-
per H ing split longitudinally between its connection to said bosses to accommodate expansion incident to the heating of the piston.

F3 26. ~~27.~~ An integrally formed piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically
per I opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end
per H from the said side wall by an air gap, spaced supporting connections between said head and guide portions, ~~and~~ one of said cylinder-engag-
per H ing parts being split longitudinally between its supporting connections from its upper edge to

its lower edge, and a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts.

27. ~~28.~~ A one-piece piston with a solid
per H end portion and a skirt portion supported therefrom by spaced integral connections and having formed in its peripheral face a transverse slot adjacent the solid end of the piston
per H and a single longitudinal slot in the skirt be-
per H tween the spaced integral connections and extending from the transverse slot to the open end of the piston, said slots forming ad-
per H jacent disconnected main peripheral bear-

per H ing portions in the skirt which are capable
Insert H[a] of unrestrained outward and inward movement.— (4) H[a]

Renumber Claims 27 and 28 as 29 and 30.

The Examiner's criticism of Claims 14 and 16 to 22, inclusive, has been carefully considered and it is respectfully submitted that the criticism is not well founded. The Examiner states that the "skirt portion shown by the drawings is not divided into 'parts,' 'sections,' or 'portions'." Apparently the Examiner has misread the claims since none of them describes the skirt as "divided into" parts, sections or portions. What the claims do describe is "a guide portion having diametrically opposite cylinder-engaging parts to take the angular thrust of a connecting rod." To be sure these "diametrically opposite cylinder-engaging parts" are defined only by imaginary lines insofar as the disclosure of the piston structure is concerned, but the description of these parts as "opposite cylinder-engaging parts" is by no means "arbitrary," as stated by the Examiner. As is understood by every engineer familiar with internal combustion engine practice, a certain amount of working clearance between the piston and its cylinder is absolutely

essential and, as a result of this clearance, the amount of the peripheral piston surface which actually engages the cylinder wall to take the angular thrust of the connecting rod is limited to two sections or parts each very considerably less than 180° in extent and disposed, of course, on opposite sides of the wrist pin. The angular extent of these cylinder-engaging parts is somewhat variable with the amount of the clearance, but with the cylinder and piston parts of given dimensions the angular extent of these opposite cylinder-engaging parts can be definitely determined, and there is nothing "arbitrary" about the matter.

It is respectfully submitted that the terminology of the claims in question is clear and strictly in accord with the facts and a reconsideration and allowance of said claims is urged.

Claim 25 has been rewritten to more clearly characterize the distinguishing features of applicant's lubricating means. It is submitted that the reference patents to Nichols and Marcil fall short of suggesting applicant's

construction. In the patent to Marcil there seems to be no provision whatever for conducting lubricant to the passages 16, and the construction shown in the Nichols patent would not be applicable to a piston of the type of applicant's as defined in Claim 25.

With respect to former Claim 26, which was identical with Claim 5 of the patent to Long, No. 1,395,441, the Examiner's position is understood to be that said claim in the Long patent must be read as limited to a literally T-shaped slot and that a piston in which the horizontal slot extends around the piston does not fall within the bounds of the claim.

Therefore, in order to avoid further delay in the declaration of an interference with the Long patent, applicant has eliminated the "T-shaped" terminology and respectfully urges that an interference involving Claim

29 (Claim 10 of the Long patent) be at once declared.

A supplemental oath is filed herewith in view of the Examiner's requirement in connection with Claim 30 (former Claim 28).

Respectfully submitted,

EDWARD J. GULICK,
By MILTON TIBBETTS,
His Attorney.

Please find below a communication from the EXAMINER in charge of the application of Edward J. Gulick, Filed Nov. 30, 1917, Serial No. 204,661, PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Amended March 19, 1923.

The following claims are suggested to the applicant for the purpose of interference:

—A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

A piston closed at one end and open at its opposite end, said piston having an annular cutting formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt which is approximately cylinder bearing in its entirety, a pair of wrist pin bearings depended from said piston end and being free from engagement with said skirt, supporting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the thickness of its wall and extending from the open end thereof to said annular cutting.

Failure to make the above claims within thirty days

204661—52

from the date of mailing of this letter will be taken as a disclaimer of the subject matter covered thereby.

R. M. Weaver,

Pistons
Filed November 30, 1917
Room No. 322
Division No. 12
Serial No. 204,661

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

G This application is amended as follows:

Add the following claims:

30. ~~21G.~~ ~~20.~~ A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its
G' peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion and separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

31. ~~22G.~~ ~~20.~~ A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

32. ~~23G.~~ ~~21.~~ A piston closed at one end and open at its opposite end, said piston having an annular cutting

204661—54

12460

formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt
G' contd which is approximately cylinder bearing in its entirety, a pair of wrist pin bearings depended from said piston end and being free from engagement with said skirt, supporting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the
Per H thickness of its wall between its connections to said supporting means and extending from the open end thereof to said annular cutting.—

Add H[10] Cls 33-43

REMARKS

This amendment is in response to the Office Letter of April 5, 1923 and applicant reserves the right to consider the claims again after the structure upon which they have been drawn is disclosed.

Respectfully,

EDWARD J. GULICK,
By MILTON TIBBETTS,
His Attorney.

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count

1. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being

split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

This interference involves your application above identified and an application for Pistons, filed by Ray E. Day, of 3825 North 24th Street., Tacoma, Wash., whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Illinois,

An application for Pistons, filed by George A. Taylor, of 164 Dana Avenue, Hyde Park, Mass., whose attorney is Macleod, Calver, Copeland and Dike, of Tremont Bldg., Boston, Mass.,

An application for Pistons, filed by Frank Jardine,

204661—57

204,661—2

of c/o The Aluminum Castings Co., Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East 9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures Inc., Cleveland, Ohio,

An application for Pistons, filed by Howard E. Maynard, of 700 Calvert Avenue, Detroit, Michigan, whose attorney is Whittemore, Hulbert & Whittemore, of Penobscot Bldg., Detroit, Michigan,

An application for Pistons, filed by Stephen D. Hartog, of 3219 Natural Bridge Ave., St. Louis, Missouri, whose attorney is Rippey and Kingsland of The Rialto Bldg., St. Louis, Missouri, and

An application for Internal Combustion Engine Pistons, filed by Elmer C. Long, of 1037 Main St., Quincy, Illinois, whose attorney is Herbert G. Fletcher, of 321 International Life Bldg., c/o Knight Bros., St. Louis, Missouri.

The relation of the count of the interference to the claims of the respective parties is as follows:

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head por-

tion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

This interference involves your applications above identified and an application for PISTONS, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Wash., and whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Ill.,

An application for PISTONS, filed by George A. Taylor, of 164 Dana Ave., Hyde Park, Mass., and whose attorney is Macleod, Calver, Copeland & Dike, of Tremont Bldg., Boston, Mass.,

An application for PISTON FOR AN INTERNAL COMBUSTION ENGINE, filed by Elmer C. Long, of 4834 Beaubien St., Detroit, Mich., and whose attorney is Herbert G. Fletcher, of 1111 International Life Bldg., St. Louis, Mo., and

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

This interference involves your application above identified and an application for Pistons, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Wash., and whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Ill.,

An application for Pistons, filed by Frank Jardine, of c/o The Aluminum Castings Company, Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East 9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures, Inc., Cleveland, Ohio,

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug 27 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A one piece piston provided with a solid end portion and a skirt portion, said skirt portion having a longitudinally extending slot formed through the thickness of its wall, said slot extending from the rear edge of the skirt portion and forming adjacent disconnected portions in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

This interference involves your application above identified and patent No. 1,395,441, Dated Nov. 1, 1921, application filed Dec. 9, 1918, Serial No. 265,947, by Elmer C. Long, of 1037 Main St., Quincy, Illinois, and whose attorney is Herbert G. Fletcher, of 321 International Life Bldg., St. Louis, Missouri.

POWER OF ATTORNEY

The undersigned, The Cleveland Trust Company, a corporation of the State of Ohio, having its place of business in the City of Cleveland, in said State, being (by virtue of an assignment recorded September 18th, 1922, in Liber S-116, Page—485, of The Transfers of Patents), The Assignee of the entire right, title and interest in and to the above-entitled application and the invention to which it relates, hereby appoints EVANS & MCCOY, of 724 Bulkley Building, Cleveland, Ohio, its attorneys herein, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to receive the patent, and to transact all business in the Patent Office connected therewith;

IN WITNESS WHEREOF, the said The Cleveland Trust Company, has caused its corporate seal to be hereto affixed, and these presents to be signed and executed in its name and behalf by its duly authorized officers, this 19th day of July, 1928.

THE CLEVELAND TRUST COMPANY.
By H. H. ALLYN,
Vice President.

Serial No. 204,661 12470

REMARKS

Subject to the consent of the Examiner, applicant has requested correction of the drawings in accordance with the accompanying letter.

The title of the invention has been changed from "Hydrocarbon Motors" to "Pistons", which is believed

to be a more appropriate title for the invention disclosed.

Certain formalities have been corrected in the specification.

The statement of the particular object set out in lines 14 and 15 is misleading, because the rigidity of the connection referred to from the bosses to the skirt walls is in the direction of mechanical load thrust from the connecting rod to the main bearing face of the piston skirt. This statement was interpreted by the courts in Interferences 49,575, 49,569 and 49,570 as meaning rigidity in the direction of load thrust on the piston body and not a rigid internal supporting structure that would prevent expansion and contraction of the piston skirt in response to cylinder wall pressure. See Long v. Gulick 17 Fed. (2d) 686 and United States Court of Customs and Patent Appeals decisions in Patent Appeal Docket Nos. 2608 and 2609. This amendment is made in accordance with those decisions and to render the statement of the object consistent with the remainder of the specifications and the drawings.

This application contains claims 1 to 44 17 inc, 19 to 24 inc, and 26 to 45 inc, inclusive. Claims 1, 3 to 13 inclusive, 15, 23, 24 and 29 to 32 inclusive are officially allowed. The status of the remaining claims will be taken up in the consecutive order of their numbering.

Serial No. 204,661. 12471

In considering the question of invention involved in the Gulick disclosure, the patents to Ebbs, Spillman & Mooers, and Derby and Kaiser were taken as representative of the prior art and were particularly discussed in judgments handed down in certain of the interferences. The judgment in Interference No. 49,573 handed down by the Law Examiner on April 4, 1924, involving claim 1 of Gulick as the issue, reads in part as follows:

> "The patent to Derby et al does not meet the count because the skirt formed by section 10 is not slit at one side between its connection to the pin bosses, on side members 2 of the frames, Fig. 6. As shown in Fig. 5, the split at the upper and lower sides of the skirt comes directly opposite the connection to and is not between the connection to the bosses.

The Spillman patent lacks the split in the skirt 2 and the pin bosses 12 are not connected to the upper part of the skirt. If it is conceded that there is no invention broadly in splitting the skirt of the Spillman piston after the disclosure in the Ebbs and Derby patents, which seems reasonable, the Spillman patent still falls short of anticipating the count. The idea of connecting the pin bosses of Spillman to the upper part of the skirt is not clearly suggested by Derby et al or Ebbs.

The Ebbs patent does not show pin bosses connected to the upper and lower parts of skirt f. The count calls for a plurality of pin bosses and the connections of the pin bosses to the skirt are separated since the split lies between them. The crosshead would not be the full equivalent of a pair of pin bosses in the relation defined in the count. If the crosshead c is considered the equivalent of a plurality of pin bosses, the crosshead c is connected to the central portions of the entire skirt f and not to the upper and lower parts of the skirt. The tubular bushing in crosshead c is not considered to be a pin boss, or the equivalent of a plurality of pin bosses."

The Law Examiner's decision of April 4, 1924 in Interference No. 49,576, involving Gulick claim 12 as the issue, reads in part as follows:

"The first missing limitation would require connecting flanges between the pin bosses 12 and the skirt 2 of the patent substantially above the connections shown in Figures 2 and 3 and in a zone or circumferential belt which would include the bosses. This is a material limitation having a useful function.

Serial No. 204,661. 12472

The second missing limitation is not new in itself since the Ebbs patent shows a longitudinal split in the skirt, but in cooperation with other elements not found in the Ebbs patent, it is a part of a new combination. It is noted that the claim was allowed to Gulick by the primary examiner after consideration of both patents cited.

The count is not satisfactorily anticipated by either reference or any reasonable combination of the references."

The following prior art has been specifically considered in connection with this application:

Ebbs	Patent No.	700,309	74-108- 9	Dated	May	20, 1902
Stadel		753,527	74-108- 2		March	1, 1904
Marcil		920,165	74-108- 4		March	4, 1909

French Patent to Chenard & Walcker	No.	468,595	74-108-10	Dated	July	19, 1914
British Patent to Birmingham	No.	21,435	" " 6	"	Sept.	15, 1910
British Patent to Rainforth	No.	6,826	" " 9	"	June	20, 1912
British Patent to Thomas	No.	1,411	" " 11	"	June	13, 1914

Gulick proved reduction to practice of his invention in 1914. See, for instance, the decision handed down on June 3, 1929 by the Board of Appeals in Interference No. 49,571 wherein it was held that:

> "We also concur in the opinion of the Examiner of Interferences that Gulick proved reduction to practice in 1914."

The following patents are not references against Gulick in view of his filing date and date of reduction to practice in 1914, as determined in these interferences. They are listed here for convenience and to show that they have been considered. They are as follows:

Serial No. 204,661. 12473

	Patent No.	*Filed*	*Granted*	
Schoengarth	1,174,092	Oct. 1, 1915	March 7, 1916	74-108- 9
Haas	1,229,258	Apr. 1, 1915	June 12, 1917	" " 11
Ricardo	1,294,833	Apr. 23, 1918	Feb. 18, 1919	" " 9
Spillman	1,325,176	Feb. 12, 1919	Dec. 16, 1919	" " 8
Br. to Ricardo	17,963		Dec. 23, 1915	" " 9
Fr. to Panhard	480,650		Aug. 31, 1916	" " 9

Claim 2 has been amended to include the limitation that the skirt is split longitudinally between its connections to the wrist pin bosses. The combination now recited in the claim was decided to involve patentable novelty by the Law Examiner in his consideration of claim 1 in Interference No. 49,573, that is quoted above.

Since new function results from the combination of elements now recited, the claim should be allowed.

Allowed claims 4 and 5 have been amended to complete the combination of elements recited in the claim and to bring these claims into harmony with the Law Examiner's decisions with respect to claims 1 and 2.

Allowed claims 6 and 7 have been amended to specify that the flanges extending laterally from the boss are yieldable in the direction of the wrist pin axis and relatively rigid in the direction of their length.

Claims 14 to 22 inclusive were objected to on the ground that the skirt of the Gulick piston was not *divided* into "parts, sections or portions." (Examiner's letter of Oct. 6, 1922.) An explanation of the fact that internal combustion engine pistons have well defined thrust faces on opposite sides of the piston body and that the claims did not specify the actual dividing or separation of the piston skirt along these lines, apparently satisfied the Examiner, because he declared the interferences involving claims 15 and 32, wherein the same limitation appears. Moreover, the Court of Customs and Patent Appeals considered this limitation in claim 32 in Interference No. 49,569, Patent Appeal No. 2608. The Court said:

> "It is first contended by Hartog that Gulick's guide structure does not meet the term "comprising diametrically opposite cylinder engaging parts." In this we think appellant is in error since the combination in Gulick certainly has cylinder engaging parts which are diametrically opposite to each other —that is to say, there are parts of the skirt of the piston which engage the cylinder and which are opposite each other. Hartog argues that, since Gulick has but one slit, there is, therefore, but one cylinder engaging *part* in Gulick's disclosure."

These claims 14 and 16 to 22, inclusive, were not rejected on references and are believed to be clearly allowable as originally presented. Certain of these claims have been amended to add limitations thereto.

Claim 14 as now presented, also includes an annular bearing surface at the open end of the skirt, and integral rigid connections from the bosses to the piston head.

Claim 16 has also been amended to specify that the longitudinal split in the piston skirt is located between the connections thereto of the walls joining the bosses and the skirt.

Claim 17 has been amended to specify that the connections from the guide portions of the bosses are transversely flexible, which alone distinguishes from the prior art as to the yielding characteristics of these connections.

Claim 18 has been rewritten as claim 34 in order to improve its form, and to further define the position of the longitudinal split as positioned between the connections of the skirt to the bosses. The elements of the claim have been re-arranged to improve its form.

Claims 20 and 21 have been amended to specify that the longitudinal split in the skirt wall is disposed between the spaced supporting connections for the skirt.

Claim 25 has been cancelled without prejudice because the same general subject matter is covered in other allowed claims and claim 25 appears unnecessary to full commercial protection of the invention.

Claims 26 and 27 have been further amended to define the location of the longitudinal split in the skirt as disposed between the connections of the bosses to the skirt. This is allowable subject matter, as indicated in the Law Examiner's decision.

Claim 28 is more detailed than claim 29, that was involved in Interference No. 49,588 and should be allowed. This claim also specifies a single longitudinal slot in the skirt between the connections to the head. It also specifies that the opposite side of the piston skirt is circumferentially continuous between the connections to the head. The side thrust from the connecting rod is very great during the power stroke of the piston and this construction provides a continuous bearing face for receiving this thrust. The longitudinally slit side of the skirt renders the skirt yielding in response to cylinder wall pressure on the main bearing face of the piston that receives the angular thrust from the connecting rod on the compression stroke. This thrust is much smaller than the thrust during the power stroke and therefore the slit skirt wall is capable of receiving it without danger of undue yielding or collapse. These are all important limitations not found in the prior art that give rise to new functional results.

Claim 33 has been amended to define the location of the longitudinal split as disposed between the connections from the bosses to the skirt and is clearly allowable in accordance with the previously quoted decision of the Law Examiner in connection with claim 1.

Serial No. 204,661 12476

Newly presented claims 35 to 44 45 are more restricted than certain of the previously allowed claims, and are presented in order to obtain more detailed protection on certain elements of the invention.

Claim 35 is limited to a piston in which one of the main bearing portions of the skirt is circumferentially continuous between the supporting connections to the bosses, whereas the other main bearing face is longitudinally split between its connections to the bosses. The improved functioning of the piston is also stated in the claim. This clearly distinguishes from the art and from previously proposed claims. This also applies to claim 36, wherein the split is defined as extending the entire length of the skirt.

Claim 37 specifies a yielding connection between the skirt and the piston head. The claim also specifies that only one side of the skirt is split its entire length between its connections to the head. This claim is more detailed than allowed claim 30 that was involved in Interference No. 49,570 and is believed to be clearly allowable.

Claim 38 specifies that the longitudinal split in the piston skirt is positioned in one of the main bearing faces to thereby render the skirt resiliently yieldable in response to pressure from the cylinder wall during operation. This is believed to distinguish essentially from the prior art. The longitudinal split in the skirt of the Ebbs piston is in the plane of the wrist pin axis and not in a main bearing face. Furthermore, the Ebbs piston could not be cut through its skirt in a main bearing face because the boss structure of the piston extends completely across the piston on this diameter. The Ebbs piston, furthermore, could not be so split as to render it resiliently yieldable in response to cylinder wall pressure.

Serial No. 204,661 12477

Claim 39 specifies that the skirt of the piston is yieldable in response to cylinder wall pressure and yieldingly engages the cylinder wall during operation. This

claim further specifies a yielding connection between the skirt and the head of the piston that permits yielding of the skirt in response to cylinder wall pressure. This claim also specifies a connection between the wrist pin bosses and the skirt that is rigid in the direction transverse to the wrist pin, which is in the direction of side thrust from the connecting rod. These limitations distinguish in these important particulars from all of the prior art.

Claim 40 specifies that only one of the main bearing portions of the piston skirt is slit longitudinally between its connections to the bosses and that both sides of the skirt have the transverse slits separating the head from the skirt. This claim is more detailed than claim 1 in certain particulars, but it does not specify that the skirt is separated from the head around its entire periphery in order to cover certain of the constructions reduced to practice by Gulick during his development of the general invention. This claim also specifies that the longitudinal slit in the skirt is in one of the main bearing faces and that only one main bearing face is slit.

Claim 41 specifies that the skirt wall is separated from the head around its entire periphery, that it is longitudinally slit to render the skirt wall yieldable on every diameter, and means rigidly connecting the bosses to the head and yieldingly connecting the bosses to the skirt. This same group of distinguishing limitations do not appear in other claims submitted and they essentially distinguish from the references. Ebbs is not

yieldable over the diameter parallel with the boss axis or in response to cylinder wall pressure. The Franquist skirt wall is not yieldable along the boss axis and the skirt wall is not slit as required by the claim.

Claim 42 specifies that the connection from the bosses to the skirt is yieldable along the boss axis and rigid transversely of the axis. This claim also specifies that the skirt is longitudinally slit and separated from the head on at least one side and is yieldable on every diameter. These limitations distinguish from the prior art patents.

Claim 43 specifies that the skirt is longitudinally slit between the bosses and separated from the head. This claim further specifies that the cylinder-engaging wall on one side of the bosses is non-yielding circumferen-

tially, whereas on the other side of the skirt it is longitudinally slit. The connection of the bosses to the skirt are further described as non-yielding in the direction transverse to the bosses. These distinctive elements are not found in any of the prior art disclosures and the combination specified in the claim distinguishes from the other claims submitted.

Claim 44 specifies that the cylinder-engaging part of the piston on one side is rigidly connected to the head in the direction of load thrust and that the opposite cylinder-engaging part is *yieldable* relative to the head in response to cylinder wall pressure. This combination is not shown in any of the prior art considered. Ebbs is rigid and non-yielding on both thrust faces of the piston, so that neither face yields in response to cylinder wall pressure. Franquist is yieldable on each bearing face, so that neither can be construed as rigidly connected to the head. In piston construction it is essential that the load thrust, which is very great, be transmitted from the head to a bearing face of the piston without yielding of the piston structure, which would cause the

axis of the piston to swing out of line with the axis of the cylinder. Gulick recognized this and split only one side of the piston. The cylinder bearing part of the piston that takes the side thrust during the compression stroke of the connecting rod only carries a fractional part of the load on the opposite thrust face and therefore this face was slit and made to yield by Gulick. Applicant believes that this claim is clearly allowable.

Claim 45 specifies that one of the cylinder-engaging parts of the guide portion which receives the side thrust from the connecting rod is split longitudinally to render it more yielding than the opposite cylinder-engaging part. This combination is not disclosed in any of the prior art patents considered. Franquist is yieldable to the same extent on its opposite thrust faces and Ebbs is non-yielding on its opposite thrust faces. Applicant believes that this claim is clearly allowable.

Each of the claims now presented has been carefully considered and is believed to patentably distinguish from the prior art. The claims also distinguish from

each other in important particulars. Allowance of the application as now submitted is respectfully requested.

Respectfully submitted,

EDWARD J. GULICK,

DEPARTMENT OF COMMERCE
UNITED STATES PATENT OFFICE
Washington

Please find below a communication from the Examiner in charge of this application.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Evans & McCoy,
724 Bulkley Bldg.,
Cleveland, Ohio.

Applicant: Edward J. Gulick
Ser. No. 204,661
Filed Nov. 30, 1917
For Pistons.

Responsive to the amendment of April 4, 1931.

The following claims remain in this case: 1 to 17, inclusive, 18 to 24, inclusive, and 26 to 45, inclusive.

The following claims may be allowed: 1 to 13, inclusive, 15, 23, 24, 26, 28 to 33, inclusive, and 43.

Claims 14, 16, 17 and 19 to 22, inclusive, together with claims 27, 34 to 40, inclusive, and 42, 44 and 45 are rejected for the reasons specified in the Office action of October 6, 1922 (Paper No. 12). Amplifying the reasons contained in that rejection it is desired to add that while it is proper in a case, where a mechanism has a part which performs an independent function, to claim both the mechanism and the part, as independent elements (*ex parte Duncan et al*, 124 O. G. 1207), yet such is not the case here. As heretofore stated, applicant has only a single skirt section and by separately reciting different parts of that skirt as independent elements he necessarily would include that type of piston in which the skirt is formed of separate slipper sections, which is something this applicant did not have in mind at the time the case was filed, or, at least, which is beyond anything disclosed in this application.

In other words, and to use Judge Tuttle's simile in *Bindley vs. Detroit River Tunnel Co., et al.* (253 F. R.,

751) an applicant may not properly, like Balboa when he discovered the Pacific, claim "not only what he can see, but make broad and sweeping claims, assuming no one else has any rights"; but rather must, like our Pilgrim Fathers, "settle down on a little patch and carefully fence it around, to indicate just what belongs to them."

Of course applicant is entitled to as broad claims as the art will stand, but such a claim must necessarily be within the limits of applicant's invention as described in his specification and illustrated by his drawing. As was stated in *Burroughs Adding Machine Co., vs. Felt and Tarrant Mfg. Co.*, 243 F. R. 861, 870, it is—

> "a fundamental and controlling rule that a patentee's broadest claim can be no broader than his actual invention, no matter how it may be expressed or what other claims his patent may contain. When a patentee has fully and clearly described his actual invention in the specification and drawings of his patent, and has fully covered that invention by the broadest claim to monopoly which the law will allow him, he cannot then, by merely including in his patent a more broadly or more vaguely stated claim, cover and monopolize something more than and different from his real invention."

To state this matter in another way, the question raised by presenting the claims now rejected is the same as was raised in the case of *State Bank of Chicago v. Hillman's*, 180 F. R. 732, and is this: Can an applicant rightfully include in his claims something that does not emerge from his description? The Examiner thinks not. To hold otherwise would enable an applicant to use his disclosure of a definite, tangible thing as a basis on which to draw claims which are inflated and expanded to cover wholly dissimilar devices which are in nowise the mechanical equivalents of the definite thing disclosed in the application. As was stated by the Court in the case cited:

204,661 204661—124 Paper #51

"The description is required to set forth the invention in such full, clear, concise and exact terms as to enable any person, skilled in the art to which it appertains, or with which it is most nearly connected, to make and use the same; and the claim is to enable the public to know the bounds and scope of the invention 'thus disclosed'; but 'any claim which is broader than the described invention, is void; even where that invention is valuable, and could have supported a valuable claim.' *Walker on Patents* (4th Ed.) 177, citing *Edison v. American Mutoscope Co.*, 114 Fed. 934, 52 C. C. 546."

Furthermore, while the Examiner does not entertain any doubt as to the correctness of the foregoing rejection, yet it is well settled that in a case which has been pending in the Office for a number of years, every doubt as to applicant's right to make claims of the nature rejected should be resolved against him. (*Ex parte Pope*, 222 O. G. 1055 and *ex parte Fripps*, 227 O. G. 737). And this working rule would appear to be especially applicable where the Office has reason to believe that patents have been granted containing claims drawn specifically to devices which are different, both in function and structure, to the one disclosed in the application under consideration, and claims are presented in such application worded in such manner as to dominate the patented devices.

It is noted that this case has been pending since November 30, 1917, and that applicant has had ample opportunity to present and have considered all claims and arguments he desires. The Examiner has no new

reasons or references to present, and this action is accordingly made *final*. See *ex parte Poulson*, 175 O. G. 365, 1912 C. D. 38, the decisions referred to therein, and *ex parte Jackson*, 353 O. G. 5, 1926 C. D. 102. The Examiner will admit any amendment, if presented within

204661—125

204,661 Paper #51

the statutory period, which will enable him to pass this case for issue, but will not admit any amendment which will not accomplish this result. Such amendments as properly accompany an appeal may, of course, be entered if presented in accordance with the second paragraph of Rule 68.

Claim 42 is also rejected, along with claim 41, on Spillman and Ebbs, both of record, for the reasons set forth in the Office action dated January 30, 1922, (Paper No. 10). If applicant appeals he should furnish an affidavit under Rule 48 to the effect, that the cylinder exerts pressure on the piston.

Claims 1 to 13, inclusive, 15, 23, 24, 26, 28 to 33, inclusive, and 43 may be allowed.

Claims 14, 16, 17, 19, 20, 21, 22, 27, 34 to 43, inclusive, and 44 and 45 are *finally* rejected.

C. C. Henry,
Examiner.

Division 12.

Not ent.
W. G.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In the matter of the above entitled application, and in response to Patent Office Letter of April 24, 1931, please amend as follows:

Claim 14, line 4, after "parts" insert —*thereof designed*—

Claims 16, 17, 19 and 21, at the end of line 3 of each of these claims insert —*thereof designed*—

Claim 20, line 4, after "parts" insert —*thereof designed*—.

Claim 22, line 3, after "parts" insert —*thereof designed*—;

Claim 27, line 4, after "parts" insert —*thereof designed*—.

Claim 34, line 4, cancel "for receiving" and insert —*thereof designed to receive*—

Claim 35, line 2, cancel "having", and insert: —, *parts of said skirt forming*—

line 2, at the end of the line insert —*designed*—

Claim 36, line 2, cancel "having" and insert: —, *parts of said skirt forming*—

Ser. No. 204,661.

Claim 37, line 4, after "skirt" insert —*being integral and*—

Claim 38, line 4, after "said skirt" insert —*being integral and*—

line 5, cancel "arranged" and insert —*designed*—

Claim 39, line 3, after "slitted" insert —*one piece*—

Claim 39, line 6, cancel "arranged" and insert —*designed*—

Claim 40, line 4, after "said skirt" insert —*being integral and*—

line 5, cancel "arranged" and insert —*designed*—

Claim 42, line 4, after "said skirt" insert —*being integral and*—

Claim 44, line 2, before "guide portion" cancel "a" and insert —*an integral*—

line 3, cancel "for receiving" and insert —*thereof designed to receive*—

Claim 45, line 2, before "guide" cancel "a" and insert —*an integral*—

line 4, cancel "for receiving" and insert —*thereof designed to receive*—

REMARKS

Applicant has carefully considered the Examiner's objection to the terms used in certain of the rejected claims and he has amended these claims to overcome these objections. The "cylinder-engaging parts" recited in the claims are now carefully defined as parts of the guide portion of the skirt. This change also brings the statement of the claims clearly within the wording approved by the Court in connection with this applica-

tion in Patent Appeal 2608, 47 F. (2) 365 wherein it was held that—

> "* * * the combination in Gulick certainly has cylinder engaging parts which are diametrically opposite to each other * * *"

The objectionable terms "for receiving" the angular thrust from the connecting rod have been changed to define these parts as "designed to receive" the thrust from the connecting rod. It is believed that these changes materially improve the statement in the claims and that they overcome the Examiner's objections to the previously used wording of the claims. These claims define structure that is not found in the prior art and are now believed to be allowable.

Reconsideration of the Examiner's rejection of claims 41 and 42 on the Spillman & Ebbs constructions is requested in view of the inherent non-yielding characteristics of both of these constructions when they are subjected to cylinder wall pressure by reason of thermal expansion of the piston in an engine cylinder during operation. In Ebbs, the bearing parts "f" are rigidly carried by the heavy metal cross-head "c." Any thermal expansion of this cross-head would carry the bearing parts outwardly and result in seizing of the piston. This is also true of the Spillman construction. No combination of these references, with the addition of modifications that materially change the inherent functional characteristics of the original structures is warranted when such modifications are not even remotely suggested by either reference.

As now presented, claim 41 specifies that the skirt must be so slit as to render it "yieldable on every diameter in response to cylinder wall pressure." This claim also specifies that the bosses are yieldingly connected to

the skirt so that the skirt is yieldable in response to cylinder wall pressure. Gulick was the originator of this character of piston and is believed to be entitled to this

Ser. No. 204,661.

claim. This claim closely parallels allowed claim 30 that was involved in Patent Appeal 2609, 47(2) 367.

In addition to the limitations appearing in claim 41, claim 42 specifies that the means connecting the bosses with the skirt is yieldable in the direction of the boss axis and is rigid in the direction of thrust from the connecting rod which is transverse to the boss axis. Gulick was the first to appreciate the importance of a piston construction that would receive the explosion thrusts on the skirt through webs that were non-yielding in the direction of the explosion thrusts in combination with a skirt that could yield in response to cylinder wall pressure caused by thermal expansion of the piston body. The importance of this relationship has been emphasized time and again in the decisions relating to the Gulick disclosure and the pioneer nature of this invention warrants the broad protection defined in these claims.

The affidavit under Rule 48 will be provided in due course.

Respectfully submitted,

EDWARD J. GULICK,
